Rana.

**R**ANA, the frog, in zoology; a genus belonging to the order of amphibia reptilia. The body is naked, furnished with four feet, and without any tail. There are 17 species. The most remarkable are,

1. The temporaria, or common frog. This is an animal so well known, that it needs no description; but some of its properties are very singular.

Its spring, or power of taking large leaps, is remarkably great, and it is the best swimmer of all four-footed animals. Nature hath finely adapted its parts for those ends, the fore members of the body being very lightly made, the hind legs and thighs very long, and furnished with very strong muscles.

While in a tadpole state, it is entirely a water animal; the work of generation is performed in that element, as may be seen in every pond during spring, when the female remains oppressed by the male for a number of days.

The work of propagation is extremely singular, it being certain that the frog has not a *penis intrans*. There appears a strong analogy in this case between a certain class of the vegetable kingdom and those animals; for it is well known, that when the female frog deposits its spawn, the male instantaneously impregnates it with what we may call a *farina fecundans*, in the same manner as the palm tree conveys fructification to the flowers of the female, which would otherwise be barren.

As soon as the frogs are released from their tadpole state, they immediately take to land; and if the weather has been hot, and there fall any refreshing showers, you may see the ground for a considerable space perfectly blackened by myriads of these animalcules, seeking for some secure lurking places. Some philosophers, not giving themselves time to examine into this phenomenon, imagined them to have been generated in the clouds, and showered on the earth; but had they, like our Derham, but traced them to the next pool, they would have found a better solution of the difficulty. See *Præternatural RAINS*.

As frogs adhere closely to the backs of their own species, so we know they will do the same by fish.—Walton mentions a strange story of their destroying pike; but that they will injure, if not entirely kill carp, is a fact indisputable, from the following relation. Not many years ago, on fishing a pond belonging to Mr Pitt of Encomb, Dorsetshire, great numbers of the carp were found each with a frog mounted on it, the hind legs clinging to the back, and the fore legs fixed in the corner of each eye of the fish, which were thin and greatly wasted, teased by carrying so disagree-

VOL. XVI. Part I.

able a load. These frogs Mr Pennant supposes to have been males disappointed of a mate.

The croaking of frogs is well known; and from that in fenny countries they are distinguished by ludicrous titles: thus they are styled *Dutch nightingales*, and *Boston waiters*.

Yet there is a time of the year when they become mute, neither croaking nor opening their mouths for a whole month: this happens in the hot season, and that is in many places known to the country people by the name of the *paddock moon*. It is said, that during that period their mouths are so closed, that no force (without killing the animal) will be capable of opening them.

These, as well as other reptiles, feed but a small space of the year. The food of this genus is ~~insects~~, insects, and snails. Toads are said to feed also on bees, and to do great injury to those useful insects.

During winter, frogs and toads remain in a torpid state: the last of which will dig into the earth, and cover themselves with almost the same agility as the mole. See *PHYSIOLOGY*, N° 48 and note (A), and N° 52.

2. The esculenta, or edible frog, differs from the former, in having a high protuberance in the middle of the back, forming a very sharp angle. Its colours are also more vivid, and its marks more distinct; the ground colour being a pale or yellowish green, marked with rows of black spots from the head to the rump.—This, and (Mr Pennant thinks) the former, are eaten. He has seen in the markets at Paris whole hampers full, which the venders were preparing for the table, by skinning and cutting off the fore parts, the loins and legs only being kept; but his strong dislike to these reptiles prevented a close examination into the species.

3. In the country of Pennsylvania, and some other parts of North America, there is a very large species of frogs called the *bull-frog*, or *rana ocellata*. Their irides are of a dusky red, surrounded with a yellow ring. The auricles are covered with a thin circular skin, which forms a spot behind each eye. They have four toes on the fore feet, and five palmated toes behind. Their colour is a dusky brown, mixed with yellowish green, and spotted with black. The belly is yellowish, and faintly spotted. These make a monstrous roaring noise like a bull, only somewhat more hoarse. Their size is superior to that of any other of the genus, and they can spring forward three yards at a leap. By this means they will equal in speed a very good horse in its swiftest course. Their places of abode are ponds, or bogs with stagnant water; but they never frequent streams. When many

Rana.

A

of

**Rana.** of them are together, they make such a horrid noise, that two people cannot understand each other's speech. They croak all together, and then stop for a little and begin again. It seems as if they had a captain among them: for when he begins to croak, all the others follow; and when he stops, they also become silent. When this captain gives the signal for stopping, you hear a note like *poop* coming from him. In the day-time they seldom make any great noise, unless the sky is covered; but in the night-time they may be heard at the distance of a mile and a half. When they croak, they are commonly near the surface of the water under the bushes, and have their heads out of the water. By going slowly, therefore, one may get up almost quite close to them before they go away. As soon as they are quite under water, they think themselves safe though it be ever so shallow. These creatures kill and eat young ducklings and goslings, and sometimes carry off chickens that come too near the water; when beaten, they cry out almost like little children. As soon as the air begins to grow a little cool in autumn, they hide themselves under the mud in the bottom of stagnant waters, and lie there torpid during the winter. As soon as the weather grows mild towards summer, they begin to get out of their holes and croak. They are supposed by the people of Virginia to be the purifiers of waters, and are respected as the geni of the fountains. Some of them were brought to England alive several years ago.

4. The toad, or toad, is the most deformed and hideous of all animals. The body is broad; the back flat, and covered with a pimply dusky hide; the belly large, swagging, and swelling out; the legs short, and its pace laboured and crawling; its retreat gloomy and filthy: in short its general appearance is such as to strike one with disgust and horror. Yet it is said by those who have resolution to view it with attention, that its eyes are fine: to this it seems that Shakespeare alludes, when he makes his Juliet remark,

Some say the Lark and loathed toad change eyes;

As if they would have been better bestowed on so charming a sougher than this rancous reptile.

But the hideous appearance of the toad is such as to make this one advantageous feature overlooked, and to have rendered it in all ages an object of horror, and the origin of most tremendous invocations. Aelian makes its venom so potent, that basilisk-like it conveyed death by its very look and breath: but Juvenal is content with making the Roman ladies who were weary of their husbands form a potion from its entrails, in order to get rid of the good man. This opinion begat others of a more dreadful nature; for in after-times superstition gave it preternatural powers, and made it a principal ingredient in the incantations of nocturnal hags.

This animal was believed by some old writers to have a stone in its head fraught with great virtues medical and magical: it was distinguished by the name of the reptile, and called the *toad stone*, *basilisk*, *crapaudine*, *krottenstein*; but all its fancied powers vanished on the discovery of its being nothing but the fossil-tooth of the sea wolf\*, or of some other flat-toothed

fish not unfrequent in our islands as well as several other countries. **Rana.**

But these fables have been long exploded. And as to the notion of its being a poisonous animal, it is probable that its excessive deformity, joined to the faculty it has of emitting a juice from its pimples, and a dusky liquid from its hind parts, is the foundation of the report.

That it has any noxious qualities there seem to have been no proofs in the smallest degree satisfactory, tho' we have heard many strange relations on that point.— On the contrary, there have been many who have taken them in their naked hands, and held them long without receiving the least injury: it is also well known that quacks have eaten them, and have besides squeezed their juice into a glass and drank it with impunity. We may say also, that these reptiles are a common food to many animals; to buzzards, owls, Norfolk plovers, ducks, and snakes, who would not touch them were they in any degree noxious.

So far from having venomous qualities, they have of late been considered as if they had beneficent ones; particularly in the cure of the most terrible of diseases, the *cancer*, by suction: (See *British Zoology*, Vol. III. Append. p. 389, *et seq.*) But from all circumstances, as Mr Pennant observes, they seem only to have rendered a horrible complaint more loathsome.

The most full information concerning the nature and qualities of this animal is contained in the following letters from Mr Arscott and Mr Pittsfield to Dr Miles. "It would give me great pleasure (says Mr Arscott) to be able to inform you of any particulars worthy Mr Pennant's notice concerning the toad who lived so many years with us, and was so great a favourite. The greatest curiosity in it was its becoming so remarkably tame. It had frequented some steps before the hall-door some years before my acquaintance commenced with it, and had been admired by my father for its size (which was of the largest I ever met with), who constantly paid it a visit every evening. I knew it myself above 30 years; and by constantly feeding it, brought it to be so tame, that it always came to the candle, and looked up as if expecting to be taken up and brought upon the table, where I always fed it with insects of all sorts: it was fondest of flesh maggots, which I kept in bran; it would follow them, and, when within a proper distance, would fix its eye, and remain motionless for near a quarter of a minute, as if preparing for the stroke, which was an instantaneous throwing its tongue at a great distance upon the insect, which stuck to the tip by a glutinous matter: the motion is quicker than the eye can follow (A).

"I always imagined that the root of its tongue was placed in the fore part of its under jaw, and the tip towards its throat, by which the motion must be a half circle; by which, when its tongue recovered its situation, the insect at the tip would be brought to the place of deglutition. I was confirmed in this by never observing any internal motion in its mouth, excepting one swallow the instant its tongue returned. Possibly I might be mistaken; for I never dissected one, but contented

(A) This rapid capture of its prey might give occasion to the report of its fascinating powers. Linnæus says *Insecta in fauces fascino revocat.*

Rana. tented myself with opening its mouth, and slightly inspecting it.

"You may imagine, that a toad, generally detested, (though one of the most inoffensive of all animals), so much taken notice of and befriended, excited the curiosity of all comers to the house, who all desired to see it fed; so that even ladies so far conquered the horrors instilled into them by nurses, as to desire to see it. This produced innumerable and improbable reports, making it as large as the crown of a bat, &c. &c."

The following are answers from the same gentleman to some queries proposed by Mr Pennant.

"*First*, I cannot say how long my father had been acquainted with the toad before I knew it; but when I first was acquainted with it, he used to mention it as the old toad I've known so many years: I can answer for 36 years.

"*Secondly*, No toads that I ever saw appeared in the winter season. The old toad made its appearance as soon as the warm weather came, and I always concluded it retired to some dry bank to repose till the spring. When we new-laid the steps, I had two holes made in every third step, with a hollow of more than a yard long for it, in which I imagine it slept, as it came from thence at its first appearance.

"*Thirdly*, It was seldom provoked: neither that toad, nor the multitude I have seen tormented with great cruelty, ~~ever~~ showed the least desire of revenge, by spitting or emitting any juice from their pimples.— Sometimes, upon taking it up, it would let out a great quantity of clear water, which, as I have often seen it do the same upon the steps when quite quiet, was certainly its urine, and no more than a natural evacuation.

"*Fourthly*, A toad has no particular enmity for the spider; he used to eat five or six with his millepedes (which I take to be its chief food) that I generally provided for it before I found out that flesh maggots, by their continual motion, was the most tempting bait;

but, when offered, it ate blowing flies and humble bees that come from the rat-tailed maggot in gutters, or in short any insect that moved. I imagine, if a bee was to be put before a toad, it would certainly eat it to its cost; but as bees are seldom stirring at the same time that toads are, they can seldom come in their way, as they seldom appear after sun-rising or before sun-set. In the heat of the day they will come to the mouth of their hole, I believe, for air. I once from my parlour window observed a large toad I had in the bank of a bowling-green, about 12 at noon, a very hot day, very busy and active upon the grass: so uncommon an appearance made me go out to see what it was, when I found an innumerable swarm of winged ants had dropped round his hole, which temptation was as irresistible as a turtle would be to a luxurious alderman.

"*Fifthly*, Whether our toad ever propagated its species, I know not; rather think not, as it always appeared well, and not lessened in bulk, which it must have done, I should think, if it had discharged so large a quantity of spawn as toads generally do. The females that are to propagate in the spring, I imagine, instead of retiring to dry holes, go into the bottom of ponds, and lie torpid among the weeds: for to my great surprise, in the middle of the winter, having for amusement put a long pole into my pond, and twitted it till it had gathered a large volume of weed, on taking it off I found many toads; and having cut some asunder with my knife, by accident, to get off the weed, found them full of spawn not thoroughly formed. I am not positive, but think there were a few males in March; I know there are 30 males (a) to one female, 12 or 14 of whom I have seen clinging round a female: I have often disengaged her, and put her to a solitary male, to see with what eagerness he would seize her. They impregnate the spawn as it is drawn (c) out in long strings, like a necklace, many yards long, not in a large quantity of jelly, like frogs spawn.

A 2

"*Sixthly*,

(a) Mr John Hunter has assured me, that during his residence at Belleisle, he dissected some hundreds of toads, yet never met with a single female among them.

(c) I was incredulous as to the *obstetrical* offices of the male toad; but since the end is so well accounted for, and the fact established by such good authority belief must take place.

M. Demours, in the *Memoirs of the French Academy*, as translated by Dr Templeman, Vol. I. p. 371, has been very particular in respect to the male toad as acting the part of an *accoucheur*: His account is curious, and claims a place here.

In the evening of one of the long days in summer, M. Demours, being in the king's garden, perceived two toads *coupled together* at the edge of a hole, which was formed in part by a great stone at the top.

"Curiosity drew him to see what was the occasion of the motions he observed, when two facts equally new surprised him. The *first* was the extreme difficulty the female had in laying her eggs, inasmuch that she did not seem capable of being delivered of them without some assistance. The *second* was, that the male was mounted on the back of the female, and exerted all his strength with his hinder feet in pulling out the eggs, whilst his fore-feet embraced her breast.

"In order to apprehend the manner of his working in the delivery of the female, the reader must observe, that the paws of these animals, as well those of the fore feet as of the hinder, are divided into several toes, which can perform the office of fingers.

"It must be remarked likewise, that the eggs of this species of toads are included each in a membranous coat that is very firm, in which is contained the embryo; and that these eggs, which are oblong and about two lines in length, being fastened one to another by a short but very strong cord, form a kind of chaplet, the beads of which are distant from each other about the half of their length. It is by drawing this cord with his paw that the male performs the function of a midwife, and acquits himself in it with a dexterity that one would not expect from so lumpish an animal.

"The presence of the observer did not a little discompose the male; for some time he stopped short, and threw

Rana.

"*Sixthly*, Insects being their food, I never saw any toad show any liking or dislike to any plant (p).

"*Seventhly*, I hardly remember any persons taking it up except my father and myself; I do not know whether it had any particular attachment to us.

"*Eighthly*, In respect to its end, I answer this last query. Had it not been for a tame raven, I make no doubt but it would have been now living; who one day seeing it at the mouth of its hole, pulled it out, and although I rescued it, pulled out one eye, and hurt it so, that notwithstanding its living a twelvemonth it never enjoyed itself, and had a difficulty of taking its food, missing the mark for want of its eye: before that accident it had all the appearance of perfect health."

6. The rubeta, or natter-jack, frequents dry and sandy places: it is found on Putney common, and also near Revesby abbey, Lincolnshire. It never leaps, neither does it crawl with the slow pace of a toad, but its motion is liker to running. Several are found commonly together, and like others of the genus they appear in the evenings. The upper part of the body is of a dirty yellow, clouded with brown, and covered with porous pimples of unequal sizes: on the back is a yellow line. The upper side of the body is of a paler hue, marked with black spots, which are rather rough. On the fore feet are four divided toes: on the hind five, a little webbed. The length of the body is two inches and a quarter; the breadth, one and a quarter: the length of the fore legs, one inch one-sixth; of the hind legs, two inches. We are indebted to Sir Joseph Banks, for this account.

7. The pipal, or Surinam toad, is more ugly than even the common one. The body is flat and broad; the head small; the jaws, like those of a mole, are extended, and evidently formed for rooting in the ground: the skin of the neck forms a sort of wrinkled collar: the colour of the head is of a dark chestnut, and the eyes are small: the back, which is very broad, is of a lightish gray, and seems covered over with a number of small eyes, which are round, and placed at nearly equal distances. These eyes are very different from what they seem: they are the animal's eggs, covered with their shells, and placed there for hatching. These eggs are buried deep in the skin, and in the beginning of incubation but just appear; and are very visible when the young animal is about to burst from its confinement. They are of a reddish, shining yellow colour; and the spaces between them are full of small warts, resembling pearls.

This is their situation previous to their coming forth; but nothing so much demands our admiration as the

manner of their production. The eggs, when formed in the ovary, are sent, by some internal canals, which anatomists have not hitherto described, to lie and come to maturity under the bony substance of the back: in this state they are impregnated by the male, whose seed finds its way by pores very singularly contrived, and pierces not only the skin but the periosteum: the skin, however, is still apparently entire, and forms a very thick covering over the whole brood; but as they advance to maturity, at different intervals, one after another, the egg seems to start forward, and burgesons from the back, becomes more yellow, and at last breaks; when the young one puts forth its head: it still, however, keeps its situation until it has acquired a proper degree of strength, and then it leaves the shell, but still continues to keep upon the back of the parent. In this manner the pipal is seen travelling with her wondrous family on her back, in all the different stages of maturity. Some of the strange progeny, not yet come to sufficient perfection, appear quite torpid, and as yet without life in the eggs: others seem just beginning to rise through the skin; here peeping forth from the shell, and there having entirely forsaken their prison: some are sporting at large upon the parent's back, and others descending to the ground to try their own fortune below. The male pipal is every way larger than the female, and has the skin less tightly drawn round the body. The whole body is covered with pustules, resembling pearls; and the belly, which is of a bright yellow, seems as if it were sewed up from the throat to the vent, a seam being seen to run in that direction. This animal, like the rest of the frog kind, is most probably harmless.

8. The water frog of Catsby has large black eyes, yellow irides, and long limbs: the upper part of the head and body is of a dusky green, spotted with black; and from each eye to the nose is a white line; and also a yellow line along the sides to the rump. They frequent rivulets and ditches, which they do not quit for the dry land. It is said they will spring five or six yards at a leap.

9. The *rana arborea*, or green tree frog of Catsby, is of a slender shape and bright green colour, marked on each side with a line of yellow: the eyes are black; the irides yellow: they have four toes before and five behind; at the end of each toe there is a round membrane, concave beneath, and not unlike the mouth of a leech. They lurk under the lower sides of leaves, even of the tallest trees, and adhere firmly, by means of the membranes at the ends of their toes, flicking to the smoothest surface: a looking-glass was held before one,

at

threw on the curious impertinent a fixed look that marked his disquietness and fear; but he soon returned to his work with more precipitation than before, and a moment after he appeared undetermined whether he should continue it or not. The female likewise discovered her uneasiness at the sight of the stranger, by motions that interrupted sometimes the male in his operation. At length, whether the silence and steady posture of the spectator had dissipated their fear, or that the case was urgent, the male resumed his work with the same vigour, and successfully performed his function."

(p) This question arose from an assertion of Linnæus, that the toad delighted in filthy herbs. *Delectatur coctula, asæa, flachyde fatide.* The unhappy deformity of the animal seems to be the only ground of this as well as another misrepresentation, of its conveying a poison with its pimples, its touch, and even its breath. *Verruca ladescentes venenata infusa tactu, anhelitu.*

Rana.

Ranai.  
||  
Randolph.

at four yards distance; it reached it at one leap, and fluck closely to it. At night these frogs make an incessant chirping, and leap from spray to spray in search of insects. This species is common in America and the warmer parts of Europe.

10. The land frog of Catesby has much the appearance of a toad: above it is gray or brown, spotted with dusky; below white, faintly spotted; the irides are red; and the legs short. They frequent the high lands, and are seen most frequently in wet weather and in the hottest time of the day; they leap: feed on insects, particularly the fire-fly and ant. Sometimes the Americans bake and reduce this species to powder, which, mixed with orris root, is taken as a cure for a tympany.

11. The cinereous frog has a gibbous, cinereous, and smooth back; the belly is yellow and granulated: on each side, from the nose to the rump, there is a white line; and there is the same on the outside of the thighs and legs; the toes are bullated at their ends. They inhabit Carolina.

RANAI, one of the Sandwich islands discovered by Captain Cook, is about nine miles distant from Mowee and Mororo, and is situated to the southward of the passage between those two isles. The country towards the south is elevated and craggy; but the other parts of the island had a better appearance, and seemed to be well inhabited. It abounds in roots, such as sweet potatoes, ~~turneps~~ and yams; but produces very few plantains and bread-fruit trees. The south point of Ranai is in the latitude of  $20^{\circ} 46'$  north, and in the longitude of  $169^{\circ} 8'$  east.

RANCID, denotes a fatty substance that is become rank or musty, or that has contracted an ill smell by being kept close.

RANDIA, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking with those of which the order is doubtful. The calyx is monophyllous; the corolla salver-shaped; the berry unilocular, with a capsular rind. There are two species, viz. the mitis and aculeata.

RANDOLPH (Thomas), an eminent English poet in the 17th century, was born in Northamptonshire 1605. He was educated at Westminster and Cambridge, and very early distinguished for his excellent genius; for at about nine or ten years of age he wrote the History of the Incarnation of our Saviour in verse. His subsequent writings established his character, and gained him the esteem and friendship of some of the greatest men of that age, particularly of Ben Johnson, who adopted him one of his sons in the Muses. He died in 1634, and was honourably interred. He wrote, 1. The

Muses Looking-glass, a comedy. 2. Amyntas, or the Impossible Dowry, a pastoral, acted before the king and queen. 3. Aristippus, or the Jovial Philosopher. 4. The Conceited Pedlar. 5. The Jealous Lovers, a comedy. 6. Hey for Honesty, down with Knavery, a comedy: and several poems.

RANDOM SHOT, in gunnery, is a shot made when the muzzle of a gun is raised above the horizontal line, and is not designed to shoot directly or point-blank.

The utmost random of any piece is about ten times as far as the bullet will go point-blank. The bullet will go furthest when the piece is mounted to about  $45^{\circ}$  above the level range. See GUNNERY and PROJECTILES.

RANGE, in gunnery, the path of a bullet, or the line it describes from the mouth of the piece to the point where it lodges. If the piece lie in a line parallel to the horizon, it is called the *right or level range*: if it be mounted to  $45^{\circ}$ , it is said to have the *utmost range*; all others between  $00$  and  $45^{\circ}$  are called the *intermediate ranges*.

RANGER, a sworn officer of a forest, appointed by the king's letters patent; whose business is to walk through his charge, to drive back the deer out of the purlicus, &c. and to present all trespasses within his jurisdiction at the next forest-court.

RANK, the order or place assigned a person suitable to his quality or merit.

RANK, is a straight-line made by the soldiers of a battalion or squadron, drawn up side by side: this order was established for the marches, and for regulating the different bodies of troops and officers which compose an army.

RANK and Precedence, in the army and navy, are as follow:

Engineers RANK. Chief, as colonel; director, as lieutenant-colonel; sub-director, as major; engineer in ordinary, as captain; engineer extraordinary, as captain-lieutenant; sub-engineer, as lieutenant; practitioner-engineer, as ensign.

Navy RANK. Admiral, or commander in chief of his majesty's fleet, has the rank of a field-marshal; admirals, with their flags on the main-top-mast-head, rank with generals of horse and foot; vice-admirals, with lieutenant-generals; rear-admirals, as major-generals; commanders, with broad pendants, as brigadier-generals; captains of post-ships, after three years from the date of their first commission, as colonels; other captains, as commanding post-ships, as lieutenant-colonels; captains, not taking post, as majors; lieutenants, as captains.

Random  
||  
Rank.

RANK between the Army, Navy, and Governors.

ARMY.	NAVY.	GOVERNORS.
General in chief	Admiral in chief	Commander in chief of the forces in America
Generals of horse	Admiral with a flag at the main-top-mast	Captain-general of provinces
Lieutenant-generals	Vice-admirals	Lieutenant-generals of provinces
Major-generals	Rear-admirals	Lieutenant-governors and presidents
Colonels	Post-captains of 3 years	Lieutenant-governors not commanding
Lieutenant-colonels	Post-captains	Governors of charter colonies
Majors	Captains	Deputy-governors
Captains	Lieutenants	Established by the king, 1760

*Doubling of the RANKS*, is the placing two ranks in one, frequently used in the manœuvres of a regiment.

*RANKS and Files*, are the horizontal and vertical lines of soldiers when drawn up for service.

**RANSOM**, a sum of money paid for the redemption of a slave, or the liberty of a prisoner of war. In our law-books, ransom is also used for a sum paid for the pardon of some great offence, and to obtain the offender's liberty.

**RANULA**, a tumor under a child's tongue, which, like a ligature, hinders it from speaking or sucking.

**RANUNCULUS**, CROWFOOT: A genus of the polygamia order, belonging to the polyandria class of plants; and in the natural method ranking under the 26th order, *Mutisiflque*. The calyx is pentaphyllous; there are five petals, each with a melliferous pore on the inside of the heel; the seeds naked.

*Species*. There are near 40 different species of this genus, six or eight of which claim general esteem as flowery plants for ornamenting the gardens, and a great number are common weeds in the fields, waters, and pasture ground, not having merit for garden culture. Of the garden kinds, the principal sort is the Asiatic or Turkey and Persian ranunculus, which comprises many hundred varieties of large, double, most beautiful flowers of various colours: but several other species having varieties with fine double flowers, make a good appearance in a collection, though as those of each species consist only of one colour, some white, others yellow, they are inferior to the Asiatic ranunculus, which is large, and diversified a thousand ways in rich colours, in different varieties. However, all the garden kinds in general effect a very agreeable diversity in assemblage in the flower compartments, &c. and they bring all very hardy, succeed in any open beds and borders, &c.

*Culture*. The Asiatic species in all its varieties will succeed in any light, rich, garden earth; but the florists often prepare a particular compost for the fine varieties, consisting of good garden-mould or pasture-earth, sward and all, a fourth part of rotted cow-dung, and the like portion of sea-sand; and with this they

prepare beds four feet wide and two deep: however, in default of such compost, use beds of any good light earth of your garden; or, if necessary, it may be made light and rich with a portion of drift sand and rotten dung, cow-dung is most commonly recommended; but they will also thrive in beds of well-wrought kitchen-garden earth, and they often prosper well in the common flower borders.

The season for planting the roots is both in autumn and spring; the autumn plantings generally flower strongest and soonest by a month at least, and are succeeded by the spring-planting in May and June. Perform the autumnal planting in October and early part of November, but some plant towards the latter end of September in order to have a very early bloom; but those planted about the middle or latter end of October often come up with rank leaves soon after, in winter, so as to require protection in hard frosts; those, however, planted about the middle or latter end of October, and beginning of November, rarely shoot up strong till towards spring, and will not require so much care of covering during winter; and the spring-planting may be performed the end of January or beginning of February, or as soon as the weather is settled; they will not require any trouble of covering, and will succeed the autumnal plants regularly in bloom, and will flower in good perfection. Thus by two or three different plantings you may obtain a succession of these beautiful flowers in constant bloom from April till the middle of June; but the autumnal plants, for the general part, not only flower strongest, but the roots increase more in size, and furnish the best offsets for propagation: it is, however, proper to plant both in spring and autumn.

Prepare for the choicer sorts four-feet beds of light earth, and rake the surface smooth: then plant the roots in rows lengthwise the beds, either by drilling them in two inches deep, and six inches distance in the row, and the rows six or eight asunder; or you may plant them by bedding-in, or by dibble planting, the same depth and distance.

Those designed for the borders should be planted generally

Ranunculus  
||  
Rape.

nerally towards the spring, in little clumps or patches, three, four, or five roots in each, putting them in either with a dibble or trowel, two or three inches deep, and three or four asunder in each patch, and the patches from about three to five or ten feet distance, placing them rather forward in the border.

*Propagation.* All the varieties of the Asiatic ranunculus propagate abundantly by offsets from the root, and new varieties are gained by seed.—1. By offsets. The time for separating the offsets is in summer when the flower is past, and the leaves and stalks are withered: then taking up all the roots in dry weather, separate the offsets from each main root, and after drying the whole gradually in some shady airy room, put them up in bags till the autumn and spring seasons of planting; then plant them as before, placing all the offsets in separate beds: many of them will blow the first year, but in the second they will all flower in good perfection.—2. By seed. Save a quantity of seed from the finest semi-double flowers, and sow it either in August, or in March, or April, though, to save trouble of winter-covering, some prefer the spring: it should be sowed in light rich mould, either in pots or in an east border, drawing very shallow flat drills five or six inches asunder, in which sow the seeds thinly, and cover them lightly with earth, giving frequent refreshments of water in dry weather, and in a month or six weeks the plants will rise with small leaves; observing to continue the light waterings in dry weather, to preserve the soil moist during their summer's growth to increase the size of the roots; and in June when the leaves decay, take up the roots and preserve them till the season for planting; then plant them in common beds, as before directed, and they will flower the spring following, when all the doubles of good properties should be marked, and the singles thrown away.

The juice of many species of ranunculus is so acrid as to raise blisters on the skin, and yet the roots may be eaten with safety when boiled.

**RAPACIOUS ANIMALS,** are such as live upon prey.

**RAPE,** in law, the carnal knowledge of a woman forcibly and against her will. This, by the Jewish law, was punished with death, in case the damsel was betrothed to another man: and, in case she was not betrothed, then a heavy fine of fifty shekels was to be paid to the damsel's father, and she was to be the wife of the ravisher all the days of his life; without that power of divorce, which was in general permitted by the Mosaic law.

The civil law punishes the crime of ravishment with death and confiscation of goods: under which it includes both the offence of forcible abduction, or taking away a woman from her friends; and also the present offence of forcibly dishonouring her; either of which, without the other, is in that law sufficient to constitute a capital crime. Also the stealing away a woman from her parents or guardians, and debauching her, is equally penal by the emperor's edict, whether she consent or is forced. And this, in order to take away from women every opportunity of offending in this way; whom the Roman laws suppose never to go astray without the seduction and arts of the other sex; and therefore, by restraining and making so highly penal the solicitations of the men, they meant to secure effectually the honour

of the women. But our English law does not entertain quite such sublime ideas of the honour of either sex, as to lay the blame of a mutual fault upon one of the transgressors only; and therefore makes it a necessary ingredient in the crime of rape, that it must be against the woman's will.

Rape was punished by the Saxon laws, particularly those of King Athelstan, with death; which was also agreeable to the old Gothic or Scandinavian constitution. But this was afterwards thought too hard; and in its stead another severe, but not capital, punishment was inflicted by William the Conqueror, viz. castration and loss of eyes; which continued till after Bracton wrote, in the reign of Henry III. But in order to prevent malicious accusations, it was then the law; (and, it seems, still continues to be so in appeals of rape), that the woman should, immediately after, go to the next town, and there make discovery to some credible persons of the injury she has suffered; and afterwards should acquaint the high constable of the hundred, the coroners, and the sheriff, with the outrage. This seems to correspond in some degree with the laws of Scotland and Arragon, which require that complaint must be made within 24 hours: though afterwards by statute Westm. 1. c. 13. the time of limitation in England was extended to 40 days. At present there is no time of limitation fixed: for, as it is usually now punished by indictment at the suit of the king, the maxim of law takes place, that "nullum tempus occurrit regi:" but the jury will rarely give credit to a stale complaint. During the former period also it was held for law, that the woman (by consent of the judge and her parents) might redeem the offender from the execution of his sentence, by accepting him for her husband; if he also was willing to agree to the exchange, but not otherwise.

In the 3 Edw. I. by the statute Westm. 1. c. 13. the punishment of rape was much mitigated: the offence itself, of ravishing a damsel within age, (that is, twelve years old) either with her consent or without, or of any other woman against her will, being reduced to a trespass, if not prosecuted by appeal within 40 days, and subjecting the offender only to two years imprisonment, and a fine at the king's will. But this lenity being productive of the most terrible consequences, it was, in ten years afterwards, 13 Edw. I. found necessary to make the offence of forcible rape felony by statute Westm. 2. c. 34. And by statute 18 Eliz. c. 7. it is made felony without benefit of clergy: as is also the abominable wickedness of carnally knowing or abusing any woman-child under the age of ten years; in which case the consent or non-consent is immaterial, as by reason of her tender years she is incapable of judgment and discretion. Sir Matthew Hale is indeed of opinion, that such profligate actions committed on an infant under the age of twelve years, the age of female discretion by the common law, either with or without consent, amount to rape and felony; as well since as before the statute of Queen Elizabeth: but that law has in general been held only to extend to infants under ten; though it should seem that damsels between ten and twelve are still under the protection of the statute Westm. 1. the law with respect to their seduction not having been altered by either of the subsequent statutes.

A male infant, under the age of fourteen years, is presumed

Rape.

Rape. presumed by law incapable to commit a rape, and therefore it seems cannot be found guilty of it. For though in other felonies "*malitia supplet ætatem*," yet, as to this particular species of felony, the law supposes an imbecility of body as well as mind.

The civil law seems to suppose a prostitute or common harlot incapable of any injuries of this kind: not allowing any punishment for violating the chastity of her, who hath indeed no chastity at all, or at least hath no regard to it. But the law of England does not judge so hardly of offenders, as to cut off all opportunity of retreat even from common strumpets, and to treat them as never capable of amendment. It therefore holds it to be felony to force even a concubine or harlot; because the woman may have forsaken that unlawful course of life: for, as Bracton well observes, "*licet meretrix fuerit antea, certe tunc temporis non fuit, cum reclamando nequitia ejus consentire noluit.*"

As to the material facts requisite to be given in evidence and proved upon an indictment of rape, they are of such a nature, that, though necessary to be known and settled, for the conviction of the guilty and preservation of the innocent, and therefore are to be found in such criminal treatises as discourse of these matters in detail, yet they are highly improper to be publicly discussed, except only in a court of justice. We shall therefore merely add upon this head a few remarks from Sir Matthew Hale, with regard to the competency and credibility of witnesses; which may, *salvo pudore*, be considered.

And, first, the party ravished may give evidence upon oath, and is in law a competent witness; but the credibility of her testimony, and how far forth she is to be believed, must be left to the jury upon the circumstances of fact that concur in that testimony. For instance: if the witness be of good fame; if she presently discovered the offence, and made search for the offender; if the party accused fled for it; these and the like are concurring circumstances, which give greater probability to her evidence. But, on the other side, if she be of evil fame, and stand unsupported by others; if she concealed the injury for any considerable time after she had opportunity to complain; if the place, where the fact was alleged to be committed, was where it was possible she might have been heard, and she made no outcry; these and the like circumstances carry a strong, but not conclusive, presumption that her testimony is false or feigned.

Moreover, if the rape be charged to be committed on an infant under 12 years of age, she may still be a competent witness, if she hath sense and understanding to know the nature and obligations of an oath; and, even if she hath not, it is thought by Sir Matthew Hale, that she ought to be heard without oath, to give the court information; though that alone will not be sufficient to convict the offender. And he is of this opinion, first, Because the nature of the offence being secret, there may be no other possible proof of the actual fact; though afterwards there may be concurring circumstances to corroborate it, proved by other witnesses; and, secondly, Because the law allows what the child told her mother, or other relations, to be given in evidence, since the nature of the

case admits frequently of no better proof; and there is much more reason for the court to hear the narration of the child herself, than to receive it at second hand from those who swear they heard her say so. And indeed it seems now to be settled, that in these cases infants of any age are to be heard; and, if they have any idea of an oath, to be also sworn: it being found by experience, that infants of very tender years often give the clearest and truest testimony. But in any of these cases, whether the child be sworn or not, it is to be wished, in order to render her evidence credible, that there should be some concurrent testimony of time, place, and circumstances, in order to make out the fact; and that the conviction should not be grounded singly on the unsupported accusation of an infant under years of discretion. There may be therefore, in many cases of this nature, witnesses who are competent; that is, who may be admitted to be heard; and yet, after being heard, may prove not to be credible, or such as the jury is bound to believe. For one excellence of the trial by jury is, that the jury are triers of the credit of the witnesses, as well as of the truth of the fact.

"It is true (says this learned judge), that rape is a most detestable crime, and therefore ought severely and impartially to be punished with death; but it must be remembered, that it is an accusation easy to be made, hard to be proved, but harder to be defended by the party accused, though innocent." He then relates two very extraordinary cases of malicious prosecution for this crime, that had happened within his own observation; and concludes thus: "I mention these instances, that we may be the more cautious upon trials of offences of this nature, wherein the court and jury may with so much ease be imposed upon, without great care and vigilance; the heinousness of the offence many times transporting the judge and jury with so much indignation, that they are over-hastily carried to the conviction of the persons accused thereof, by the confident testimony of sometimes false and malicious witnesses."

RAPHAEL (D'Urbino), the greatest, most sublime, and most excellent painter that has appeared, since the revival of the fine arts, was the son of an indifferent painter named *Sanzio*, and was born at Urbino on Good Friday 1482. The popes Julius II. and Leo X. who employed him, loaded him with wealth and honour; and it is said that Cardinal de St Bibiana had such a value for him, that he offered him his niece in marriage. His genius is admired in all his pictures; his contours are free, his ordonnances magnificent, his designs correct, his figures elegant, his expressions lively, his attitudes natural, his heads graceful; in fine, every thing is beautiful, grand, sublime, just, and adorned with graces. These various perfections he derived not only from his excellent abilities, but from his study of antiquity and anatomy; and from the friendship he contracted with Ariosto, who contributed not a little to the improvement of his taste. His pictures are principally to be found in Italy and Paris. That of the Transfiguration, preserved at Rome in the church of St Peter Monterio, passes for his masterpiece. He had a handsome person, was well proportioned, and had great sweetness of temper; was polite, affable, and modest.

Rape,  
Raphael.

*Recurvirostra Americana.*

*Raphidia.*

*Ribbon Loom.*

*Reduction.*

**Raphaim** <sup>†</sup> **Raphidia** deft. He, however, lived in the utmost splendour; most of the eminent masters of his time were ambitious of working under him; and he never went out without a crowd of artists and others, who followed him purely through respect. He was not only the best painter in the world, but perhaps the best architect too; on which account Leo X. charged him with building St Peter's church at Rome: but he was too much addicted to pleasure, which occasioned his death at 37 years of age. He left a great number of disciples; among whom were Julio Romano and John Francis Penni, who were his heirs. Many able engravers, as Raimondi, George Mantuan, and Bloemart, engraved after Raphael. See **PAINTING**, p. 595 and 598.

**RAPHAÏM**, or **REPHAIM** (Moses), a name signifying *Giants*, as they really were, and an actual people too, situated in Balan or Batanea, beyond Jordan, separated from the Zanzummim by the river Jabbok. Also a valley near Jerusalem: Joshua x.

**RAPHANUS**, **RADISH**; a genus of the siliquosa order, belonging to the tetradsamia class of plants; and in the natural method ranking under the 39th order, *Siliquose*. The calyx is close; the siliqua torose, or swelling out in knots, subarticulated, and round. There are two melliferous glandules between the shorter stamina and the pistil, and two between the longer stamina and the calyx.

There is only one species, viz. the sativus, or common garden radish; of which there are several varieties. They are annual plants, which being sowed in the spring, attain perfection in two or three months, and shoot up soon after into stalk for flower and seed, which, ripening in autumn, the whole plant, root and top, perishes; so that a fresh supply must be raised annually from seed in the spring, performing the sowings at several different times, from about Christmas until May, in order to continue a regular succession of young tender radishes throughout the season: allowing only a fortnight or three weeks interval between the sowings; for one crop will not continue good longer than that space of time, before they will either run to seed, or become tough, sticky, and too hot to eat.

**RAPHANIDOSIS**, a punishment inflicted at Athens upon adulterers. The manner of it was this: The hair was plucked off from the privities of the offender, hot ashes laid upon the place, and a radish or mullet thrust up his fundament, as has been mentioned under **ADULTERY**. To this Juvenal alludes, *Sat. X. ver. 317. Quosdam machos et mugilis intrat*. Persons who had been thus punished were called *raphanidosi*. The word *raphanidosi* is derived from *raphanis*, a radish.

**RAPHIDIA**, in zoology; a genus of insects, of the neuroptera order; the characters of which are these: The head is of a horny substance, and depressed or flattened; the mouth is armed with two teeth, and furnished with four palpi: the stemmata are three in number: the wings are deflected: the antennæ are filiform, as long as the thorax; the anterior part of which is lengthened out, and of a cylindrical form: the tail of the female is terminated by an appendix, resembling a flexible crooked bristle.—There are three species. The most remarkable is the ophiopsis; which for its shape is one of the most singular that can be seen. † It has an oblong head, shaped like a heart,

with its point joined to the thorax, and the broad part before. It is smooth, black, flattened, continually shaking, with short antennæ, yellowish maxillæ, and four palpi. Towards the middle of the upper part of the head, between the eyes, are the three stemmata, placed in a triangle. The thorax, to which this head is fastened, is narrow, long, and cylindrical. The abdomen, broader, is black like the rest of the body, with the segments margined yellow. The feet are of a yellowish cast. The wings, which are fastigated, are white, diaphanous, veined, and as it were covered with a very fine net-work of black. This insect, in the figure of its head, resembles a snake. It is found but seldom, and in woods only. Its larva, chrysalis, and habitation, are absolutely unknown.

**RAPIER**, formerly signified a long old-fashioned sword, such as those worn by the common soldiers: but it now denotes a small sword, as contradicting distinguished from a back-sword.

**RAPIN** (Rene), a Jesuit and eminent French writer, was born at Tours in 1621. He taught polite literature in the society of the Jesuits with great applause, and was justly esteemed one of the best Latin poets and greatest wits of his time. He died at Paris in 1687. He wrote, 1. A great number of Latin poems, which have rendered him famous throughout all Europe; among which are his *Hortorum libri quatuor*, which is reckoned his masterpiece. 2. Reflections on Eloquence, Poetry, History, and Philosophy. 3. Comparisons between Virgil and Homer, Demosthenes and Cicero, Plato and Aristotle, Thucydides and Titus Livius. 4. The History of Jansenism. 5. Several works on religious subjects. The best edition of his Latin poems is that of Paris in 1723, in 3 vols. 12mo.

**RAPIN de Thoyras** (Paul de), a celebrated historian, was the son of James de Rapin lord of Thoyras, and was born at Castres in 1661. He was educated at first under a tutor in his father's house: and afterwards sent to Puylaurens, and thence to Saumur. In 1679 he returned to his father, with a design to apply himself to the study of the law, and was admitted an advocate: but some time after, reflecting that his being a Protestant would prevent his advancement at the bar, he resolved to quit the profession of the law, and apply himself to that of the sword; but his father would not consent to it. The revocation of the edict of Nantes in 1685, and the death of his father, which happened two months after, made him resolve to come to England; but as he had no hopes of any settlement here, his stay was but short. He therefore soon after went to Holland, and listed himself in the company of French volunteers at Utrecht, commanded by M. Rapin his cousin-german. He attended the prince of Orange into England in 1688: and the following year the lord Kingston made him an ensign in his regiment, with which he went into Ireland, where he gained the esteem of his officers at the siege of Carrickfergus, and had soon a lieutenant's commission. He was present at the battle of the Boyne, and was shot thro' the shoulder at the siege of Limerick. He was soon after captain of the company in which he had been ensign; but, in 1693, resigned his company to one of his brothers, in order to be tutor to the earl of Portland's son.

Rapier,  
Rapin.

Rapine  
||  
Ras-el-  
Feel.

son. In 1699, he married Marienne Testard; but this marriage neither abated his care of his pupil, nor prevented his accompanying him in his travels. Having finished this employment, he returned to his family, which he had settled at the Hague; and here he continued some years. But as he found his family increase, he resolved to retire to some cheap country; and accordingly removed, in 1707, to Wesel, where he wrote his History of England, and some other pieces. Though he was of a strong constitution, yet seventeen years application (for so long was he in composing the history just mentioned) entirely ruined his health. He died in 1725. He wrote in French, 1. A Dissertation on the Whigs and Tories. 2. His History of England, printed at the Hague in 1726 and 1727, in 9 vols. 4to, and reprinted at Trevoux in 1728, in 10 vols. 4to. This last edition is more complete than that of the Hague. It has been translated into English, and improved with Notes, by the Reverend Mr Tindal, in 2 vols. folio. This performance, though the work of a foreigner, is deservedly esteemed as the fullest and most impartial collection of English political transactions extant. The readers of wit and vivacity, however, may be apt to complain of him for being sometimes rather tedious and dull.

**RAPINE**, in law, the taking away another's goods, &c. by violence.

**RAPPERSWIL**, a town of Switzerland, on the confines of the canton of Zurich, and of the territory of Gaster, with an old castle. It is strong by situation, being seated on a neck of land which advances into the lake of Zurich, and over which there is a bridge 850 paces long. It is subject to the cantons of Zurich and Berne. E. Long. 8. 57. N. Lat. 47. 20.

**RAPPOLSTEIN**, a town of France in Upper Alsace, which, before the Revolution, had the title of a barony. All the musicians of Alsace likewise depended upon this baron, and were obliged to pay him a certain tribute, without which they could not play upon their instruments. E. Long. 7. 28. N. Lat. 48. 15.

**RAPTURE**, an ecstacy or transport of mind. See **EXTASY**.

**RARE**, in physic, stands opposed to dense; and denotes a body that is very porous, whose parts are at a great distance from one another, and which is supposed to contain but little matter under a large bulk. See the following article.

**RAREFACTION**, in physics, the act whereby a body is rendered rare; that is, brought to possess more room, or appear under a larger bulk, without accession of any new matter. This is very frequently the effect of fire, as has long been universally allowed. In many cases, however, philosophers have attributed it to the action of a repulsive principle. However, from the many discoveries concerning the nature and properties of the electric fluid and fire, there is the greatest reason to believe, that this repulsive principle is no other than elementary fire. See **REPULSION**.

**RAS-EL-FEEL**, one of the frontier provinces of Abyssinia, of which the late celebrated traveller Mr Bruce was made governor while in that country. It is but of small extent, and in its most prosperous state contained only 39 villages. The climate is extremely hot, Mr Bruce's opinion one of the hottest in the world. He informs us, that on the first day of March, at three

o'clock in the afternoon, the thermometer stood at 114° in the shade, and in the evening at 82°; though at sunrise it had been no higher than 61. Notwithstanding this appearance of extreme heat, however, the sensation was by no means intolerable; they could hunt at mid-day, and felt the evenings rather cold. The soil is a fat, loose, black earth, which our author says is the same from 13° to 16° of north latitude; at least till we come to the deserts of Athara, where the tropical rains cease. This country divides that of the Shangalla into two parts, nearly equal. These people inhabit a belt of land about 60 miles broad, all along the northern frontier of Abyssinia, excepting two large gaps or spaces which have been left open for the sake of commerce, and which are inhabited by strangers, to keep the Shangalla in awe. The latter trade in gold, which they pick up in the streams as it is washed down from the mountains; for there are no mines in their country, neither is there any gold in Abyssinia, excepting what is imported from this or some other country. The Shangalla are the natural enemies of the inhabitants of Ras-el-Feel, and much blood has been shed in the various incursions they have made upon one another; though of late those of Ras-el-Feel, by the assistance of the emperors, have been enabled to keep the Shangalla at bay.

**RAS-SEM**, a city of Tripoli in Barbary, concerning which a number of fables were told by the Tripoline ambassador, all of which were believed in England and other parts of Europe in the beginning of this century. (See **PETRIFIED CITY**). Mr Bruce informs us, that it is situated about five days journey south from Bengasi; but has no water excepting one fountain, which has a disagreeable taste, and seems to be impregnated with alum. Hence it has obtained the name of *Ras-Sem*, or the fountain of poison. The only remains of antiquity in this place consist of the ruins of a tower or fortification, which, in the opinion of Mr Bruce, is as late as the time of the Vandals; but he says he cannot imagine what use they made of the water, and they had no other within two days journey of the place.—Here our traveller saw many of the animals called *jerboa*, a kind of mice; which, he says, seem to partake as much of the nature of a bird as of a quadruped.

**RASAY**, one of the Hebrides islands, is about 13 miles long and 2 broad. It contains 700 inhabitants, has plenty of lime-stone, free-stone; and feeds great numbers of black cattle; but has neither deers, hares, nor rabbits. The only appearance of a harbour in Rasay is at Clachan bay, where Mr Macleod the proprietor of the island resides. Rasay presents a bold shore, which rises to the height of mountains; and here the natives have, with incredible labour, formed many little corn fields and potato grounds. These heights decrease at the south end, where there are some farms and a good-looking country. Mr Macleod is sole proprietor of this island, and of Rona and Fladda at the north end of it, which are only proper for grazing.

The house of Rasay is pleasantly situated near the south-west end of the island, which is the most level part of it. It has an extensive and excellent garden, and is surrounded with forest trees of considerable magnitude; another proof that trees will grow upon the edge of the sea, though it must be allowed that the channel

Ras-Sem  
Rasay.

**Rascians** channel here is narrow. Immediately behind the house of Rafay are the ruins of an ancient chapel, now used as the family burying-place.

**Raßenburg.**

Dr Johnson, in his Tour, expresses the highest satisfaction at the reception he met with when in Rafay from Mr Macleod.

**RASCIANS**, a poor oppressed people who dwelt on both sides of the Danube, and who about the year 1594, being weary of the Turkish thralldom, first took 13 of their vessels upon that river; and then drawing together a body of fifteen thousand men between Buda and Belgrade, twice defeated the pasha of the Temeswar with a body of fourteen thousand Turks. They afterwards took Baczkerek, four miles from Belgrade, and the castle of Ottadt; then laying siege to that of Beche, on the Theysa, the old pasha of Temeswar marched to relieve it with eleven thousand men; but the Rascians encountering them, slew near ten thousand, and took 18 pieces of cannon. The consequence of this victory was the reduction of Weretza and Lutz. Then, sending to the archduke for aid and gunners, they offered to put themselves and their country under the emperor's protection.

**RASOR**—*See* ALCA, N° 4.

**RASOR-Fish.**—*See* SOLE.

**RASTALL** (John), a printer and miscellaneous writer, was born in London, probably about the end of the 15th century, and educated at Oxford. Returning from the university, he settled in the metropolis, and commenced printer, "then esteemed (says Wood) a pretension fit for any scholar or ingenious man." He married the sister of Sir Thomas More, with whom, we are told, he was very intimate, and whose writings he strenuously defended. From the title page of one of his books, he appears to have lived in Cheapside, at the sign of the mermaid. He died in the year 1536; and left two sons, William and John: the first of whom became a judge in Queen Mary's reign, and the latter a justice of peace. This John Rastall, the subject of the present article, was a zealous Papist; but Bale says, that he changed his religion before his death. He wrote, 1. *Natura naturata*. Pits calls it a copious (prolixa) and ingenious comedy, describing Europe, Asia, and Africa; with cuts. What sort of a comedy this was, is not easy to conceive. Probably it was a cosmographical description, written in dialogue, and therefore styled a comedy. 2. The pastyme of the people; the cronycles of diverse realmes, and most especially of the realm of England, brevely compiled and emprinted in Cheapsyde, at the sign of the mermaid, next Polylsgate, *cum privilegio*, fol. 3. *Ecclesia Johannis Rastall*, 1542. Was one of the prohibited books in the reign of Henry VIII. 4. *Legum Anglicanarum vocabula explicata*. French and Latin. Lond. 1567, 8vo. And some other works.

**RASTADT**, a town of Germany, in the circle of Suabia and marquisate of Baden, with a handsome castle. It is remarkable for a treaty concluded here between the French and Imperialists in 1714; and it is seated on the river Merg, near the Rhine. E. Long. 9. 14. N. Lat. 48. 53.

**RASTENBURG**, a fine city in Prussia, on the Guber, surrounded with a wall, and since 1629 also with a rampart.

**RAT**, in zoology. *See* MVS.

The following receipt is said to have been found effectual for the destruction of rats. Take of the seeds of flavesacre or lousewort, powdered, more or less as the occasion requires, one part; of oat-meal, three parts; mix them well, and make them up into a paste with honey. Lay pieces of it in the holes, and on the places where mice and rats frequent; and it will effectually kill or rid the place of those kind of vermine by their eating thereof.

Some time ago, the Society for encouraging Arts proposed a premium of 50l. for a preparation capable of alluring or fascinating rats so that they might be taken alive. In consequence of this, a great number of new traps, &c. were invented; and the following methods of alluring the rats to a certain place were published.

One of these most easily and efficaciously practised is the trailing some pieces of their most favourite food, which should be of the kind that has the strongest scent, such as toasted cheese or broiled red herrings, from the holes or entrances of the closet to their recesses in every part of the house or contiguous building. At the extremities and in different parts of the course of this trailed track, small quantities of meal, or any other kind of their food, should be laid, to bring the greater number into the tracks, and to encourage them to pursue it to the place where they are intended to be taken: at that place, when time admits of it, a more plentiful repast is laid for them, and the trailing repeated for two or three nights.

Besides this trailing and way-baiting, some of the most expert of the rat-catchers have a shorter and perhaps more effectual method of bringing them together; which is the calling them, by making such a whistling noise as resembles their own call; and by this means, with the assistance of the way-bits, they call them out of their holes, and lead them to the repast prepared for them at the place designed for taking them. But this is much more difficult to be practised than the art of trailing; for the learning the exact notes or cries of any kind of beasts or birds, so as to deceive them, is a peculiar talent which is seldom attained: though some persons have been known who could call together a great number of cats; and there was a man in London who could bring nightingales, when they were within hearing, about him, and even allure them to perch on his hand, so as to be taken.

In practising either of those methods, of trailing or calling, great caution must be used by the operator to suppress and prevent the scent of his feet and body from being perceived; which is done by overpowering that scent by others of a stronger nature. In order to this, the feet are to be covered with cloths rubbed over with asafetida, or other strong smelling substances; and even oil of rhodium is sometimes used for this purpose, but sparingly, on account of its dearness, though it has a very alluring as well as disguising effect. If this caution of avoiding the scent of the operator's feet, near the track, and in the place where the rats are proposed to be collected, be not properly observed, it will very much obstruct the success of the attempt to take them; for they are very shy of coming where the scent of human feet lies very fresh, as it intimates to their sagacious instinct the presence of human creatures, whom they

**Rat.**

**Rat.** naturally dread. To the above-mentioned means of alluring by trailing, way-baiting, and calling, is added another of a very material efficacy, which is, the use of oil of rhodium, which, like the marum Syriacum in the case of cats, has a very extraordinary fascinating power on these animals. This oil is extremely dear, and therefore sparingly used. It is exhaled in a small quantity in the place, and at the entrance of it, where the rats are intended to be taken; particularly at the time when they are to be last brought together, in order to their destruction; and it is used also by smearing it on the surface of some of the implements used in taking by the method below described; and the effect it has in taking off their caution and dread, by the delight they appear to have in it, is very extraordinary.

It is usual, likewise, for the operator to disguise his figure as well as scent, which is done by putting on a sort of gown or cloak, of one colour, that hides the natural form, and makes him appear like a post or some such inanimate thing; which habit must likewise be scented as above, to overpower the smell of his person; and besides this, he is to avoid all motion till he has secured his point of having all the rats in his power.

When the rats are thus enticed and collected, where time is afforded, and the whole in any house and out-buildings are intended to be cleared away, they are suffered to regale on what they most like, which is ready prepared for them, and then to go away quietly for two or three nights; by which means those that are not allured the first night are brought afterwards, either by their fellows, or the effects of the trailing, &c. and will not fail to come duly again, if they are not disturbed or molested. But many of the rat-catchers make shorter work, and content themselves with what can be brought together in one night or two; but this is never effectual, unless where the building is small and entire, and the rats but few in number.

The means of taking them, when they are brought together, are various. Some entice them into a very large bag, the mouth of which is sufficiently capacious to cover nearly the whole floor of the place where they are collected; which is done by smearing some vessel, placed in the middle of the bag, with oil of rhodium, and laying in the bag baits of food. This bag, which before lay flat on the ground with the mouth spread open, is to be suddenly closed when the rats are all in. Others drive or fright them, by slight noises or motions, into a bag of a long form, the mouth of which, after all the rats are come in, is drawn up to the opening of the place by which they entered, all other ways of retreat being secured. Others, again, intoxicate or poison them, by mixing with the repast prepared for them the coculus Indicus, or the nux vomica. They direct four ounces of the coculus Indicus, with twelve ounces of oatmeal, and two ounces of treacle or honey, made into a moist paste with strong beer: but if the nux vomica be used, a much less proportion will serve than is here given of the coculus. Any similar composition of these drugs, with that kind of food the rats are most fond of, and which has a strong flavour, to hide that of the drugs, will equally well answer the end. If indeed the coculus Indicus be well powdered, and infused in strong beer for some time, at least half the quantity here directed will serve as well as the quantity before-mentioned. When the rats appear to be thoroughly in-

toxicated with the coculus, or sick with the nux vomica, **Rat-Island** they may be taken with the hand, and put into a bag or cage, the door of the place being first drawn to, lest those who have strength and sense remaining escape.

**Rat-Island**, a small detached part of the island of Lundy, off the north coast of Devon. Though noted in Domesday's map of the county, it is not worth mention here, but as giving opportunity to subjoin a farther notice of Lundy, which island was purchased a few years since by Mr Cleveland, M. P. for about 1200 guineas, who has a small villa on it: not more than 400 acres are cultivated: it is let altogether for 70l. a-year. The soil is good, though no trees will grow on the island. It has fine springs of water: the houses are seven: the inhabitants, men, women, and children, do not exceed 24. The bird called *mare*, whose eggs are very large and fine, the Lundy parrot, and rabbits, are the chief produce; these abound, and are taken for the teachers, eggs, and skins, principally. They have now (1794) 70 bullocks and 400 sheep, but the latter do not thrive. They pay no taxes: fishing skiffs often call with necessities: the situation is very pleasant, and the rocks around, which are large, and partly granite, are wild, romantic, and novel. It had probably some inhabitants once, as human bones have been ploughed up. It has no place of worship, nor public house, but strangers are always welcome. Eight cannons lie on the battlements on the top of a very steep precipice, under which is a curious cavern. Lord Gower, Sir Denon, and Sir J. B. Warren, K. B. have been former proprietors. See LUNDY.

**Rat-Tails**, or *Arrests*. See FARRIERE, §. XXVII.

**RATAFIA**, a fine spirituous liquor, prepared from the kernels, &c. of several kinds of fruits, particularly of cherries and apricots.

Ratafia of cherries is prepared by bruising the cherries, and putting them into a vessel where brandy has been long kept; then adding to them the kernels of cherries, with strawberries, sugar, cinnamon, white pepper, nutmeg, cloves; and to 20 pound of cherries 10 quarts of brandy. The vessel is left open ten or twelve days, and then stopped close for two months before it be tapped. Ratafia of apricots is prepared two ways, viz. either by boiling the apricots in white wine, adding to the liquor an equal quantity of brandy, with sugar, cinnamon, mace, and the kernels of apricots; infusing the whole for eight or ten days; then straining the liquor, and putting it up for use; or else by infusing the apricots, cut in pieces, in brandy, for a day or two, passing it through a straining bag, and then putting in the usual ingredients.

**RATCH**, or *RASH*, in clock-work, a sort of wheel having twelve fangs, which serve to lift up the detents every hour, and make the clock strike. See CLOCK.

**RATCHETS**, in a watch, are the small teeth at the bottom of the fusee, or barrel, which stops it in winding up.

**RATE**, a standard or proportion, by which either the quantity or value of a thing is adjusted.

**RATES**, in the navy, the orders or classes into which the ships of war are divided, according to their force and magnitude.

The regulation, which limits the rates of men of war to the smallest number possible, seems to have been dictated by considerations of political economy, or of that

Rates

of the simplicity of the service in the royal dock-yards. The British fleet is accordingly distributed into six rates, exclusive of the inferior vessels that usually attend on naval armaments; as sloops of war, armed ships, bomb-ketches, fire-ships and cutters, or schooners commanded by lieutenants.

Ships of the first rate mount 100 cannon, having 42-pounders on the lower deck, 24-pounders on the middle deck, 12-pounders on the upper deck, and 6-pounders on the quarter-deck and fore-castle. They are manned with 850 men, including their officers, seamen, marines, and servants.

In general, the ships of every rate, besides the captain, have the master, the boatswain, the gunner, the chaplain, the purser, the surgeon, and the carpenter; all of whom, except the chaplain, have their fosters or assistants, in which are comprehended the sail-maker, the miter at arms, the armourer, the captain's clerk, the gunsmith, &c.

The number of other officers is always in proportion to the size of the ship. Thus a first rate has six lieutenants, six master's mates, twenty-four midshipmen, and five surgeon's mates, who are considered as gentlemen; besides the following petty officers; quarter-masters and their mates, fourteen; boatswain's mates and yeomen, eight; gunner's mates and assistants, six; quarter-gunners, twenty-five; carpenter's mates, two, besides fourteen assistants; with one steward, and steward's mate to the purser.

If the dimensions of all ships of the same rate were equal, it would be the simplest and most perspicuous method to collect them into one point of view in a table: but as there is no invariable rule for the general dimensions, we must content ourselves with but a few remarks on ships of each rate, so as to give a general idea of the difference between them.

The *Victory*, one of the last built of our first rates, is 222 feet 6 inches in length, from the head to the stern; the length of her keel, 131 feet 3 inches; that of her gun-deck, or lower deck, 186 feet; her extreme breadth 41 feet 10 inches; her depth in the hold, 21 feet 6 inches; her burden, 2265 tons; and her poop reaches 6 feet before the mizen-mast.

Ships of the second rate carry 60 guns upon three decks; of which those on the lower battery are 32-pounders; those on the middle, 18-pounders; on the upper deck, 12-pounders; and those on the quarter-deck, 6-pounders; which usually amount to four or six. Their complement of men is 750, in which there are six lieutenants, four master's mates, 54 midshipmen, and four surgeon's mates, 14 quarter-masters and their mates, eight boatswain's mates and yeomen, six gunner's mates and yeomen, with 22 quarter-gunners, two carpenter's mates, with 10 assistants, and one steward and steward's mate.

Ships of the third rate carry from 64 to 80 cannon, which are 32, 18, and 9-pounders. The 80 gun ships however begin to grow out of repute, and to give way to those of 74, 70, &c. which have only two whole batteries; whereas the former have three, with 28 guns planted on each, the cannon of their upper deck being the same as those on the quarter-deck and fore-castle of the latter, which are 9-pounders. The complement in a 74 is 650, and in a 64, 500 men; having, in peace, four lieutenants, but in war, five; and when an admiral

Rates

is aboard, six. They have three master's mates, 16 midshipmen, three surgeon's mates, 10 quarter-masters and their mates, six boatswain's mates and yeomen, four gunner's mates and yeomen, with 18 quarter-gunners, one carpenter's mate, with eight assistants, and one steward and steward's mate under the purser.

Ships of the fourth rate mount from 60 to 50 guns, upon two decks, and the quarter-deck. The lower tier is composed of 24-pounders, the upper tier of 12-pounders, and the cannon on the quarter-deck and fore-castle are 6-pounders. The complement of a 50 gun ship is 350 men, in which there are three lieutenants, two master's mates, 10 midshipmen, two surgeon's mates, eight quarter-masters and their mates, four boatswain's mates and yeomen, one gunner's mate and one yeoman, with 12 quarter-gunners, one carpenter's mate and six assistants, and a steward and steward's mate.

All vessels of war, under the fourth rate, are usually comprehended under the general name of *frigates*, and never appear in the line of battle. They are divided into the 5th and 6th rates; the former mounting from 40 to 32 guns, and the latter from 28 to 20. The largest of the fifth rate have two decks of cannon, the lower battery being of 18-pounders, and that of the upper deck of 9-pounders; but those of 36 and 32 guns have one complete deck of guns, mounting 12-pounders, besides the quarter-deck and fore-castle, which carry 6-pounders. The complement of a ship of 44 guns is 280 men; and that of a frigate of 36 guns, 240 men. The first has three, and the second two, lieutenants; and both have two master's mates, six midshipmen, two surgeon's mates, six quarter-masters and their mates, two boatswain's mates and one yeoman, one gunner's mate and one yeoman, with 10 or 11 quarter-gunners, and one purser's steward.

Frigates of the 6th rate carry 9-pounders, those of 28 guns having 3-pounders on their quarter deck, with 200 men for their complement; and those of 24, 160 men: the former has two lieutenants, the latter, one; and both have two master's mates, four midshipmen, one surgeon's mate, four quarter-masters and their mates, one boatswain's mate and one yeoman, one gunner's mate and one yeoman, with six or seven quarter-gunners, and one purser's steward.

The sloops of war carry from 18 to 8 cannon, the largest of which have six-pounders; and the smallest, viz. those of 8 or 10 guns, four-pounders. Their officers are generally the same as in the 6th rates, with little variation; and their complements of men are from 120 to 60, in proportion to their force or magnitude. *N. B.* Bomb-vessels are on the same establishment as sloops; but fire-ships and hospital ships are on that of fifth rates.

Nothing more evidently manifests the great improvement of the marine art, and the degree of perfection to which it has arrived in Britain, than the facility of managing our first rates; which were formerly esteemed incapable of government, unless in the most favourable weather of the summer.

Ships of the second rate, and those of the third, which have three decks, carry their sails remarkably well, and labour very little at sea. They are excellent in a general action, or in cannonading a fortress. Those of the third rate, which have two tiers, are fit for the line

Ration  
||  
Ratio.

line of battle, to lead the convoys and squadrons of ships of war in action, and in general to suit the different exigencies of the naval service.

The fourth-rates may be employed on the same occasions as the third-rates, and may also be destined amongst the foreign colonies, or on expeditions of great distance; since these vessels are usually excellent for keeping and sustaining the sea.

Vessels of the fifth-rate are too weak to suffer the shock of a line of battle; but they may be destined to lead the convoys of merchant ships, to protect the commerce in the colonies, to cruise in different stations, to accompany squadrons, or be sent express with necessary intelligence and orders. The same may be observed of the sixth-rates.

The frigates, which mount from 28 to 38 guns upon one deck, with the quarter-deck, are extremely proper for cruising against privateers, or for short expeditions, being light, long, and usually excellent sailers.

RATEEN, or RATTEN, in commerce, a thick woollen stuff, quilled, woven on a loom with four treddles, like serges and other stuffs that have the whale or quilling. There are some rateens dressed and prepared like cloths; others left simply in the hair, and others where the hair or knap is friezed. Rateens are chiefly manufactured in France, Holland, and Italy, and are mostly used in linings. The frieze is a sort of coarse rateen, and the drugget is a rateen half linen half woollen.

RATIFICATION, an act approving of and confirming something done by another in our name.

RATIO, in arithmetic and geometry, is that relation of homogeneous things which determines the quantity of one from the quantity of another, without the intervention of a third.

Two numbers, lines, or quantities, A and B, being proposed, their relation one to another may be considered under one of these two heads: 1. How much A exceeds B, or B exceeds A? And this is found by taking A from B, or B from A, and is called *arithmetic reason*, or *ratio*. 2. Or how many times, and parts of a time, A contains B, or B contains A? And this is called *geometric reason*, or *ratio*; (or, as Euclid defines it, it is the *mutual habitude*, or *respect*, of two magnitudes of the same kind, according to quantity; that is, as to how often the one contains, or is contained in, the other); and is found by dividing A by B, or B by A. And here note, that that quantity which is referred to another quantity is called the *antecedent of the ratio*; and that to which the other is referred is called the *consequent of the ratio*; as, in the ratio of A to B, A is the antecedent, and B the consequent. Therefore any quantity, as antecedent, divided by any quantity as a consequent, gives the ratio of that antecedent to the consequent.

Thus the ratio of A to B is  $\frac{A}{B}$ , but the ratio of B to A is  $\frac{B}{A}$ ; and, in numbers, the ratio of 12 to 4 is  $\frac{12}{4} = 3$ , or triple; but the ratio of 4 to 12 is  $\frac{4}{12} = \frac{1}{3}$ , or subtriple.

And here note, that the quantities thus compared

must be of the same kind; that is, such as by multiplication may be made to exceed one the other, or as these quantities are said to have a ratio between them, which, being multiplied, may be made to exceed one another. Thus a line, how short soever, may be multiplied, that is, produced so long as to exceed any given right line; and consequently these may be compared together, and the ratio expressed: but as a line can never, by any multiplication whatever, be made to have breadth, that is, to be made equal to a superficies, how small soever; these can therefore never be compared together, and consequently have no ratio or respect one to another, according to quantity; that is, as to how often the one contains, or is contained in, the other. See QUANTITY.

RATIOCINATION, the art of reasoning. See REASONING.

RATION, or RATIAN, in the army, a portion of ammunition, bread, drink, and forage distributed to each foldier in the army, for his daily subsistence. The horse have rations of hay and oats when they cannot go out to forage. The rations of bread are regulated by weight. The ordinary ration of a foot soldier is a pound and a half of bread per day. The officers have several rations according to their quality and the number of attendants they are obliged to keep. When the ration is augmented on occasions of rejoicing, it is called a *double ration*. The ship's crews have also their rations or allowances of biscuit, pulse, and water, proportioned according to their stock.

RATIONALE, a solution or account of the principles of some opinion, action, hypothesis, phenomenon, or the like.

RATIBOR, a town of Germany, in Silesia, and capital of a duchy of the same name, with a castle. It has been twice taken by the Swedes, and is situated on the river Oder, in a country fertile in corn and fruit, 15 miles north-east of Troppaw, and 742 miles from Paris. E. Long. 22. 24. N. Lat. 50. 14.

RATISBON, an ancient, large, rich, handsome, and strong city of Germany, in Bavaria, free and imperial, with a bishop's see, whose bishop is a prince of the empire. It is called by the Germans *Regensburg*, from the river *Régens*, which runs under a fine stone bridge, and throws itself into the Danube below the city; and the rivers *Leber* and *Nab* mix with it above the city. The French call it *Ratisbon*, in imitation of the Latins; it hath formerly been subject to the kings of Bavaria, who made it the place of their residence; but it was declared free by the emperor Frederick I. which does not however hinder the dukes of Bavaria from dividing the toll with the citizens, according to an agreement between them. These princes have also the criminal jurisdiction, for which the magistrates of the city pay them homage. It is the first city of the bench of Suabia, and contains at present within its walls five different free states of the empire; namely, the bishop, the abbot of St Emmeran, the abbesses of the Low and High Munster, and the city. The inhabitants of Ratisbon have the privilege not to be cited before other tribunals, unless for actions above 400 florins. The senate is composed of 17 members, and there is a council of 10, which is charged with the government of the state. The citizens have a right to elect a chief, who judges of the affairs of police. The Catholics have the exercise of their religion in the cathedral church, and others, and the

Ratiocina-  
tion  
||  
Ratisbon.

Ratlines  
|  
Ravelin.

the Lutherans in three churches, which they have built. The magistrates and officers of the city are all Protestants; and it is to be remarked, that although there are about 22 Catholic churches, yet there are very few Catholic citizens, the magistracy not allowing the freedom of the town to be given to Catholics living there. As this city is large, elegant, and full of magnificent houses, it has been chosen many years for the place of holding the diet, upon account of the conveniency, to many neighbouring princes and states, of sending their provisions by land and water without great expence. The town-house, in the hall of which the diet meets, is extremely magnificent. In the year 1740, however, when there was a war in Germany, the diet met at Frankfort on the Main, till after the death of the emperor Charles VII. Provisions are very plentiful at Ratibon, in time of peace. The inhabitants have a good deal of trade, the river on which it stands being navigable, and communicating with a great part of Germany. It is 16 miles south-east of Nuremberg, 62 north of Munich, and 195 west of Vienna. E. Long. 12. 5. N. Lat. 48. 59.

**RATLINES**, or, as the sailors call them, *ratlines*, those lines which make the ladder steps to go up the shrouds and putlocks, hence called the *ratlines* of the *foremast*.

**RATOLTZEL**, a strong town of Germany, in Suabia, near the west end of the lake Constance. It is seated on that part of it called *Bodensee*, and belongs to the house of Austria, who took it from the duke of Württemberg, after the battle of Nordlingen. It is 12 miles west of the city of Constance. It is defended by the impregnable castle of Hohen Dweil, on an inaccessible hill in the middle of a plain, the rock of which is firm, so that a few men may hold it out against an army.

**RATTLESLAKE**. See CROTALUS.

**RATTLESLAKE Root**. See POLYGALA.

**RATZBURG**, or RATZEMBURG, an ancient town of Germany, in the circle of Lower Saxony, and in the duchy of Lawenburg, with a bishop's see and a castle. The town depends on the duchy of Lawenburg, and the cathedral church on that of Ratzburg. It is seated on an eminence, and almost surrounded with a lake 25 miles in length and three in breadth. The duke of Lawenburg seized and fortified it in 1689; and the king of Denmark took it in 1693; but it was dismantled, and restored in 1700 to the duke, who re-fortified it. This town has been frequently pillaged, particularly in 1552, by Francis duke of Saxe Lawenburg, because the canons refused to elect his son Magnus their bishop. It lies nine miles south of Lubeck. This place is noted for its excellent beer. E. Long. 10. 58. N. Lat. 53. 47.

**RAVA**, a town of Great Poland, and capital of a palatinate of the same name, with a fortified castle, where they keep state prisoners. The houses are built of wood, and there is a Jesuits college. It is seated in a morass covered with water, which proceeds from the river Rava, with which it is surrounded. It is 45 miles south of Bloko, and 50 south-west of Warsaw. The palatinate is bounded on the north by that of Bloko, on the east by that of Mazovia, on the south by that of Sandomer, and on the west by that of Lencicz.

**RAVELIN**, in fortification, was anciently a list

baillon placed in the middle of a curtain; but now a detached work composed only of two faces, which make a salient angle without any flanks, and raised before the counterescarp of the place. See FORTIFICATION.

**RAVEN**, in ornithology. See CORVUS.

*Sea RAVEN*, or *corvo marino* of Kongo in Africa, in ichthyology, is about six feet long, and big in proportion; but the most singular circumstance appertaining to this creature is the stone found in its head, to which the natives ascribe some medicinal virtues, and the delicate taste of its hard roe, which is still much admired, when dried in the sun, and becomes as hard as a stone.

**RAVENGLAS**, a town of Cumberland in England, situated between the rivers Irt and Esk, which, with the sea, encompass three parts of it. It is a well built place, and has a good road for shipping, which brings it some trade. E. Long. 0. 5. N. Lat. 54. 20.

**RAVENNA** (anc. *georg.*), a noble city of Gallia Cispadana; a colony of Thessalians, on the Adriatic, in wadies or a boggy situation, which proved a natural security to it. The houses were all of wood, the communication by bridges and boats, and the town kept sweet and clean by the tides carrying away the mud and soil, (Strabo). Anciently it had a port at the mouth of the Padis; Augustus added a new port, capacious to hold a fleet, for the security of the Adriatic, between which and the city lay the Via Caesaris. In the lower age it was the seat of the Ostrogoths for 72 years; but being recovered by Narfes, Justinian's general, it became the residence of the exarchs, magistrates sent by the emperor from Constantinople, for 175 years, when it was taken by the Longobards. It is still called *Ravenna*, capital of Romania. The seat of the western or Roman empire was by Honorius translated to Ravenna about the year 404, and hence the country in which it stood was called *Romania*, in the pope's territory. It had a very flourishing trade till the sea withdrew two miles from it, which has been a great detriment. The fortifications are of little importance, and the citadel is gone to ruin. It is now most remarkable for the excellent wine produced in its neighbourhood. The mausoleum of Theodoric is still to be seen, remarkable for being covered by a single stone 28 feet in diameter and 17 thick. It was at Ravenna that the duke of Nemours fell, after having gained a most decisive victory over the confederate army, in 1511. See FRANCE, N° 129, and Modern Universal History, Vol. XX. p. 324, &c.

**RAVENSBURG**, a county of Germany, in Westphalia, bounded on the north by the bishoprics of Osnaburg and Minden, on the east by Lemgow, on the south by the bishopric of Paderborn, and on the west by that of Munster. It belongs to the king of Prussia, and has its name from the castle of Ravensburg.

**RAVENSBURG**, a free and imperial town of Germany, in Algow, in the circle of Suabia. It is well built, and the public structures are handsome. The inhabitants are partly Protestants and partly Papists. It is seated on the river Chenst, in E. Long. 9. 46. N. Lat. 47. 44.

**RAVET**, an insect shaped like a may-bug, or cock-chaffer, (see SCARABÆUS), with which the island of Guadalupe is much pestered. It has a stinking smell, preys upon paper, books, and furniture, and whatever they

Ravilliac. they do not gnaw is discoloured by their ordure. These nasty insects, which are very numerous, and appear chiefly by night, would be intolerable, were it not for a large spider, some of them as long as a man's fist, which entangles them in its web, and otherwise surprises them. On which account the inhabitants of the island are very careful of these spiders.

Modern U-  
niv. Hist.  
Vol. XXI.  
p. 147.  
note (A),  
&c.

RAVILLIAC (Francis), the infamous assassin of Henry IV. of France, was a native of Angoulême, and at the time of his execution was about one or two and thirty years of age. See FRANCE, N° 146, and HENRY IV. of France. Ravilliac was the son of parents who lived upon alms. His father was that sort of inferior retainer to the law, to which the vulgar give the name of a *pettifogger*, and his son had been bred up in the same way. Ravilliac had set up a claim to an estate; but the cause went against him: this disappointment affected his mind deeply: he afterwards taught a school, and, as himself said, received charitable gifts, though but of a very small value, from the parents of those whom he taught; and yet his distress was so great, that he had much ado to live. When he was seized for the king's murder, he was very loosely guarded; all were permitted to speak with him who pleased; and it was thought very remarkable that a Jesuit should say to him, "Friend, take care, whatever you do, that you don't charge honest people." He was removed next day from the house of Espernon to the Conciergerie, the proper prison of the parliament of Paris. When he was first interrogated, he answered with great boldness, "That he had done it, and would do it, if it were to do again." When he was told that the king, though dangerously wounded, was living, and might recover, he said that he had struck him home, and that he was sure he was dead. In his subsequent examinations he owned that he had long had an intention to kill the king, because he suffered two religions in his kingdom; and that he endeavoured to obtain an audience of him, that he might admonish him. He also said that he understood the king's great armament to be against the pope, and that, in his opinion, to make war against the pope, was to make war against God. We have no distinct account of the three last examinations; but he is said to have persisted, in the most solemn asseverations, that he had no accomplices, and that nobody had persuaded him to the fact. He appeared surprised at nothing so much as at the universal abhorrence of the people, which, it seems, he did not expect. They were forced to guard him strictly from his fellow-prisoners, who would otherwise have murdered him. The butchers of Paris desired to have him put into their hands, affirming that they would slay him alive, and that he should still live 12 days. When he was put to the torture, he broke out into horrid execrations, and always insisted that he did the fact from his own motive, and that he could accuse nobody. On the day of his execution, after he had made the *amende honorable* before the church of Notre Dame, he was carried to the Greve; and, being brought upon a scaffold, was tied to a wooden engine in the shape of a St Andrew's cross. The knife with which he did the murder being fastened in his right hand, it was first burnt in a slow fire; then the fleshy parts of his body were torn with red hot pincers, and melted lead, oil, pitch, and rosin, poured into the wounds,

and through a clay funnel into his bowels by the navel. The people refused to pray for him; and when, according to the sentence pronounced upon him, he came to be dragged to pieces by four horses, one of those that were brought appearing to be but weak, one of the spectators offered his own, with which the criminal was much moved: he is said to have then made a confession, which was so written by the greffier Voisin, that not so much as one word of it could ever be read. He was very earnest for absolution, which his confessor refused, unless he would reveal his accomplices; "Give it me conditionally," (said he); upon condition that I have told the truth," which they did. His body was so weak, that it resisted the force of the horses; and the executioner was at length obliged to cut him into quarters, which the people dragged through the streets. The house in which he was born was demolished, and a column of infamy erected; his father and mother were banished from Angoulême, and ordered to quit the kingdom upon pain of being hanged, if they returned, without any sort of process; his brothers, sisters, uncles, and other relations, were commanded to lay aside the name of Ravilliac, and to assume some other. Such was the fate of this execrable monster, who, according to his own account, suffered himself to be impelled to such a fact by the seditious sermons and books of the Jesuits, whom Henry, without of fear than love, had recalled and cherished, and to whom he had bequeathed his heart.

Neither the dying words of Ravilliac, nor so much of his process as was published, were credited by his contemporaries. Regalt the historian says, that there were two different opinions concerning this assassination; one, that it was conducted by some grandees, who sacrificed that monarch to their old resentments; the other, that it was done by the emissaries of the Spaniards. Letters from Brussels, Antwerp, Mechlin, and other places, were received before the 15th of May, with a report of the king's death. Though nothing occurs in the examinations of Ravilliac that were first published, in reference to his journey to Naples, and other places; yet as these are set down as certain truths by good authors, so there are probable grounds to believe that they were not fictitious. It appears from Sir Ralph Winwood's Memorials, that Ravilliac had been not long before at Brussels. Amongst other circumstances that engaged a very great doubt, whether the assassin spoke truth, were the things found in his pocket at the time he was seized; amongst which was a chaplet, the fibres of a heart made in cotton, in the centre of which he said there was a bit of the true cross, but when cut there was none, which he affirmed was given him by a canon at Angoulême; a piece of paper with the arms of France painted upon it, another full of characters, and a third containing verses for the meditation of a criminal going to execution. The provost of Plaviers, or Petiviers, in Beauce, about six miles from Paris, had said openly on the day that Henry IV. was murdered, "This day the king is either slain or dangerously wounded." After the king's death was known, he was seized and sent prisoner to Paris; but, before he was examined, he was found hanged in the strings of his drawers. His body was, notwithstanding, hung up by the heels on the common gibbet on the 19th of June. What increased the suspicions grounded

Ray  
Ray.

grounded on this man's end, was his having two sons Jesuits, and his being a dependent on the family of Monsieur d'Entragues.

RAUN, upon the river Miza, a town of some strength, remarkable for a bloody skirmish between the Prussians and Austrians, in August 1744. The king of Prussia, intending to get possession of Beraun, sent thither six battalions, with eight cannon, and 800 halibars; but General Festitz being there with a great party of his corps, and M. Luchesi with 1000 horse, they not only repulsed the Prussians, but attacked them in their turn, and, after a warm dispute, obliged them to retire with considerable loss.

RAURICUM (anc. geog.), a town of the Raurici, situated over against Abnoba, a mountain from which the Danube takes its rise. A Roman colony led by L. Manlius Plautus the scholar and friend of Cicero: called *Colonia Raurica* (Pliny), *Raurica* (Inscription), *Municipium Rauricorum*. The town was destroyed in Julian's time. It is now commonly called *Augs*, a village greatly decayed from what it formerly was. It is situated on the Rhine, distant about two hours to the east of Basel. The country is now the canton of Basel.

RAY (John); a celebrated botanist, was the son of Mr Roger Ray a blacksmith, and was born at Black Notley in Essex in 1628. He received the first rudiments of learning at the grammar-school at Brain-tree; and in 1644 was admitted into Catharine-hall in Cambridge, from whence he afterwards removed to Trinity college in that university. He took the degree of master of arts, and became at length a senior fellow of the college; but his intense application to his studies having injured his health, he was obliged at his leisure hours to exercise himself by riding or walking in the fields, which led him to the study of plants. He noted from Johnson, Parkinson, and the *Phytologia Britannica*, the places where curious plants grew; and in 1668 rode from Cambridge to the city of Chester, from whence he went into North Wales, visiting many places, and among others the famous hill of Snowdon; returning by Shrewsbury and Gloucester. In 1660 he published his *Catalogus Plantarum circa Cantabrigiam miscellaneus*, and the same year was ordained deacon and priest. In 1661 he accompanied Francis Willoughby, Esq; and others in search of plants and other natural curiosities, in the north of England and Scotland; and the next year made a western tour from Chester, and through Wales, to Cornwall, Devonshire, Dorsetshire, Hampshire, Wiltshire, and other counties. He afterwards travelled with Mr Willoughby and other gentlemen through Holland, Germany, Italy, France, &c. took several tours in England, and was admitted fellow of the Royal Society. In 1672, his intimate and beloved friend Mr Willoughby died in the 37th year of his age, at Middleton Hall, his seat in Yorkshire; "to the infinite and unspeakable loss a grief (says Mr Ray) of myself, his friends, and all good men." There having been the closest and sincerest friendship between Mr Willoughby and Mr Ray, who were men of similar natures and tastes, from the time of their being fellow collegians, Mr Willoughby not only confided in Mr Ray, in his lifetime, but also at his death: For he made him one of the executors of his will, and charged him with the education of his sons Francis and

Thomas, leaving him also for life 60l. per annum. The eldest of these young gentlemen not being four years of age, Mr Ray, as a faithful trustee, betook himself to the instruction of them; and for their use composed his *Nomenclator Classicus*, which was published this very year, 1672. Francis the eldest dying before he was of age, the younger became Lord Middleton. Not many months after the death of Mr Willoughby, Mr Ray lost another of his best friends, Bishop Wilkins; whom he visited in London the 18th of November 1672, and found near expiring by a total suppression of urine for eight days. As it is natural for the mind, when it is hurt in one part, to seek relief from another; so Mr Ray, having lost some of his best friends, and being in a manner left destitute, conceived thoughts of marriage; and accordingly, in June 1673, did actually marry a gentlewoman of about 20 years of age, the daughter of Mr Oakley of Launton in Oxfordshire. Towards the end of this year, came forth his "Observations Topographical, Moral, &c." made in foreign countries; to which was added his *Catalogus Stirpium in exteris regionibus observatarum*: and about the same time, his *Collection of unusual or local English words*, which he had gathered up in his travels through the counties of England. After having published many books on subjects foreign to his profession, he at length resolved to publish in the character of a divine, as well as in that of a natural philosopher; in which view he published his excellent demonstration of the being and attributes of God, entitled *The Wisdom of God manifested in the Works of the Creation*, 8vo, 1697. The rudiments of this work were read in some college lectures; and another collection of the same kind he enlarged and published under the title of *Three Physico-theological Discourses, concerning the Chaos, Deluge, and Dissolution of the World*, 8vo. 1692. He died in 1705. He was modest, affable, and communicative; and was distinguished by his probity, charity, sobriety, and piety. He wrote a great number of works; the principal of which, besides those already mentioned, are, 1. *Catalogus Plantarum Angliae*. 2. *Dictionariolum Trilingue secundum locos communes*. 3. *Historia Plantarum, Species hactenus editas, aliasque insuper multis noviter inventas et descriptas complectens*, 3 vols. 4. *Methodus Plantarum nova, cum Tabulis*, 8vo, and several other works on plants. 5. *Synopsis Methodica Animalium quadrupedum et Serpentinum generis*, 8vo. 6. *Synopsis Methodica Avium et Piscium*. 7. *Historia Insectorum, opus posthumum*. 8. *Methodus Insectorum*. 9. *Philosophical Letters, &c.*

RAY, in optics, a beam of light emitted from a radiant or luminous body. See LIGHT and OPTICS.

*Inflected Rays*, those rays of light which, on their near approach to the edges of bodies, in passing by them, are bent out of their course, being turned either from the body or towards it. This property of the rays of light is generally termed *diffraction* by foreigners, and Dr Hooke sometimes called it *deflection*.

*Reflected Rays*, those rays of light which, after falling upon the body, do not go beyond the surface of it, but are thrown back again.

*Refracted Rays*, those rays of light which, after falling upon any medium, enter its surface, being bent either towards or from a perpendicular to the point on which they fell.

Ray  
||  
Reading.

*Pencil of Rays*, a number of rays issuing from a point of an object, and diverging in the form of a cone.

**RAZOR**, a well-known instrument, used by surgeons, barbers, &c. for shaving off the hair from various parts of the body.—As shaving to many people is a most painful operation, cutlers in different countries have long applied their skill to remove that inconvenience. Some have invented soaps of a peculiar kind to make the operation more easy, and some have invented straps. With respect to razors, some artists have succeeded rather by accident than from any fixed principle; and therefore we have found great inequality in the goodness of razors made by the same artist.

A correspondent assures us, that he has for 40 years past been at much pains to find out razors made by the best makers both in England and Scotland, and was fortunate enough, about 22 years ago, to discover a kind made by a Scotchman of the name of *Logan*, which he called magnetical razors, because they were directed to be touched with an artificial magnet before using. These, our friend assures us, are most excellent razors, and he has used them for upwards of 20 years. He says likewise that they continue in good order, without requiring to be ground; but that the great drawback on their being generally used, is the price, which is higher than most people are able or disposed to give for that instrument. Our correspondent, who resides in the vicinity of London, also informs us, that lately the famous surgeon-instrument-maker, Mr Savigny in Pall Mall, after numberless experiments, in the course of above 20 years, has at length brought razors to a degree of perfection never yet equalled; and with such certainty, that the purchaser is in no danger of a disappointment, though the price is very moderate. By these, we are told, the operation of shaving is performed with greater ease, more perfectly, and more expeditiously than with any other.

**RE**, in grammar, an inseparable particle added to the beginning of words to double or otherwise modify their meaning; as in re-action, re-move, re-export, &c.

**RE-ACTION**, in physiology, the resistance made by all bodies to the action or impulse of others that endeavour to change its state whether of motion to rest, &c.

**READING**, the art of delivering written language with propriety, force, and elegance.

"We must not judge so unfavourably of eloquence or good reading (says the illustrious Fenelon), as to reckon it only a frivolous art, that a declaimer uses to impose upon the weak imagination of the multitude, and to serve his own ends. It is a very serious art, designed to instruct people; to suppress their passions and reform their manners; to support the laws, direct public councils, and to make men good and happy."

Reason and experience demonstrate, that *delivery in reading ought to be less animated than in interested speaking*. In every exercise of the faculty of speech, and those expressions of countenance and gesture with which it is generally attended, we may be considered to be always in one of the two following situations: First, delivering our *lesser sentiments* on circumstances which relate to ourselves or others, or, secondly, *repeating* something that was spoken on a certain occasion for the amuse-

Delivery in  
reading  
should be  
less animat-  
ed than in  
spoken.

Reading.

ment or information of an auditor. Now, if we observe the deliveries natural to these two situations, we shall find, that the first may be accompanied with every degree of expression which can manifest itself in us, from the lowest of sympathy to the most violent and energetic of the superior passions; while the latter, from the speaker's chief business being to repeat what he heard *with accuracy*, discovers only a faint imitation of those signs of the emotions which we suppose agitated him from whom the words were first borrowed.—The use and necessity of this difference of manner is evident; and if we are attentive to these natural signs of expression, we shall find them conforming with the greatest nicety to the slightest and most minute movements of the breast.

This repetition of another's words might be supposed to pass through the mouth of a second or third person; and in these cases, since they were not ear and eye witnesses of him who first spoke them, their manner of delivery would want the advantage necessarily arising from an immediate idea of the original one; hence, on this account, this would be a still less lively representation than that of the first repeater. But as, from a daily observation of every variety of speech and its associated signs of emotion, mankind soon become pretty well acquainted with them, and this in different degrees, according to their discernment, sensibility, &c. experience shows us that these latter repeaters (as we call them) might conceive and use a manner of delivery which, though less characteristic perhaps, would on the whole be no way inferior to the first, as to the common natural expression proper for their situation. It appears, therefore, that repeaters of every degree may be esteemed upon a level as to animation, and that our twofold distinction above contains accurately enough the whole variety of ordinary delivery;—we say *ordinary*, because

There is another very peculiar kind of delivery sometimes used in the person of a repeater, of which it will in this place be necessary to take some notice. What we mean here is *mimicry*; an accomplishment which, when perfectly and properly displayed, never fails of yielding a high degree of pleasure. But since this pleasure chiefly results from the principle of imitation respecting manner, and not from the purport of the matter communicated; since, comparatively speaking, it is only attainable by few persons, and practised only on particular occasions,—on these accounts it must be refused a place among the modes of useful delivery taught us by general nature, and esteemed a qualification purely anomalous.

These distinctions with regard to a speaker's situation of mind premised, let us see to which of them an author and his reader may most properly be referred, and how they are circumstanced with regard to one another.

The matter of all books is, either what the author says in his own person, or an acknowledged recital of the words of others: hence an author may be esteemed both an original speaker and a repeater, according as what he writes is of the first or second kind. Now a reader must be supposed either actually to personate the author, or one whose office is barely to communicate what he has said to an auditor. But in the first of these suppositions he would, in the delivery of what is the author's own, evidently commence *mimic*; which being, as above

above observed, a character not acknowledged by general nature in this department, ought to be rejected as generally improper. The other supposition therefore must be accounted right; and then, as to the *whole* matter of the book, the reader is found to be exactly in the situation of a *repeater*, save that he takes what he delivers from the page before him instead of his memory. It follows then, in proof of our initial proposition, that, if we are directed by nature and propriety, the manner of our delivery in reading ought to be inferior in warmth and energy to what we should use, were the language before us the spontaneous effusions of our own hearts in the circumstances of these out of whose mouths it is supposed to proceed.

Evident as the purport of this reasoning is, it has not so much as been glanced at by the writers on the subject we are now entered upon, or any of its kindred ones; which has occasioned a manifest want of accuracy in several of their rules and observations. Among the rest, this precept has been long reverberated from author to author as a perfect standard for propriety in reading: "Deliver yourselves in the same manner you would do, were the matter your own original sentiments uttered directly from the heart." As all kinds of delivery must have many things in common, the rule will in many articles be undoubtedly right; but, from what has been said above, it must be as certainly faulty in respect to several others; as it is certain nature never confounds by like signs two things so very different, as a *copy* and an *original*, an emanation darted immediately from the sun, and its weaker appearance in the lunar reflection.

The precepts we have to offer for improving the above-mentioned rule, shall be delivered under the heads of *accent, emphasis, modulation, expression, pauses, &c.*

**I. Accent.** In attending to the affections of the voice when we speak, it is easy to observe, that, independent of any other consideration, one part of it differs from another, in *stress, energy, or force* of utterance. In words we find one syllable differing from another with respect to this mode; and in sentences one or more words as frequently vary from the rest in a similar manner. This stress with regard to *syllables* is called *accent*, and contributes greatly to the variety and harmony of language. Respecting *words*, it is termed *emphasis*; and its chief office is to assist the sense, force, or perspicuity of the sentence—of which more under the next head.

"Accent (as described in the Lectures on Elocution) is made by us two ways; either by dwelling longer upon one syllable than the rest, or by giving it a smarter percussion of the voice in utterance. Of the first of these we have instances in the words *glōry, fāther, hōly*; of the last in *bat'tle, hab'it, bor'row*. So that accent with us is not referred to tune, but to time; to quantity, not quality; to the more equable or precipitate motion of the voice, not to the variation of the notes or inflexions."

In *theatric declamation*, in order to give it more pomp and solemnity, it is usual to dwell longer than common upon the unaccented syllables; and the author now quoted has endeavoured to prove (p. 51. 54.) the practice faulty, and to show (p. 55.) that "though it (i. e. true solemnity) may demand a slower utterance

than usual, yet (it) requires that the same proportion in point of quantity be observed in the syllables, as there is in musical notes when the same tune is played in quicker or slower time." But that this deviation from ordinary speech is not a fault, as our author asserts; nay, that on the contrary it is a real beauty when kept under proper regulation, the following observations it is hoped will sufficiently prove.

(I.) It is a truth of the most obvious nature, that those things which on their application to their proper senses have a power of raising in us certain ideas and emotions, are ever *differently* modified in their constituent parts when different effects are produced in the mind: and also (II.) that, within proper bounds, were we to suppose these constituent parts to be proportionally increased or diminished as to *quantity*, this effect would still be the same as to *quality*.—For instance: The different ideas of strength, swiftness, &c. which are raised in us by the same species of animals, is owing to the different form of their corresponding parts; the different effects of music on the passions, to the different airs and movements of the melody; and the different expressions of human speech, to a difference in tone, speed, &c. of the voice. And their peculiar effects would still remain the same, were we to suppose the animals above alluded to, to be *greater or lesser*, within their proper bounds; the movement of the music *quicker or slower*, provided it did not palpably interfere with that of some other species; and the pitch of the voice *higher or lower*, if not carried out of the limits in which it is observed on similar occasions naturally to move. Farther (III.) since, respecting the emotions more especially, there are no rules to determine *a priori* what effect any particular attribute or modification of an object will have upon a percipient, our knowledge of this kind must evidently be gained from experience. Lastly, (IV.) In every art imitating nature we are pleased to see the characteristic members of the pattern *heightened* a little farther than perhaps it ever was carried in any real example, provided it be not bordering upon some ludicrous and disagreeable provinces of excess.

Now for the application of these premises.—To keep pace and be consistent with the *dignity* of the tragic muse, the delivery of her language should necessarily be dignified; and this it is plain from observation (I.) cannot be accomplished otherwise than by something different in the manner of it from that of ordinary speech; since *dignity* is essentially different from *familiarity*. But how must we discover this different manner? By attending to nature: and in this case she tells us, that besides using a *slower* delivery, and greater *distinctness* of the words (which every thing merely *grave* requires, and gravity is a *concomitant* of dignity, though not its *essence*), we must dwell a little longer upon the *unaccented* syllables than we do in common. As to what our author observes in the above quotation, of *dignity's* only requiring a *slower* utterance than ordinary, while the proportion of the syllables as to quantity continues the same; it is apprehended the remark (II.) respecting *quickness* and *slowness* of movement, will show it to be not altogether true. For since the delivery is not altered in *form*, its expression must be still of the same kind, and perhaps what may be rightly suggested by the term *gravely familiar*.

Reading.

But something farther may be yet said in defence of this *artificial* delivery, as our author calls it. Is not the movement of any thing, of whatever species, when dignified or solemn, in general of an *equable* and *deliberate* nature (as in the minuet, the military step, &c.)? And in theatrical declamation, is not the propensity to introduce this *equableness* so strong, that it is almost *impossible* to avoid it wholly, were we ever so determined to do it? If these two queries be answered in the affirmative (as we are persuaded they will), while the first supports our argument for the *propriety* of the manner of delivery in question, the second discovers a kind of *necessity* for it. And that this manner may be carried a little *farther* in quantity on the *stage* than is usual in *real life*, the principle (IV.) of heightening nature will justify, provided fashion (which has ever something to do in these articles) give it a sanction; for the *precise* quantity of several heightenings may be varied by this great legislator almost at will.

Emphasis.

II. *Emphasis*. As *emphasis* is not a thing annexed to particular words, as *accent* is to syllables, but owes its rise chiefly to the *meaning* of a passage, and must therefore vary its seat according as that meaning varies, it will be necessary to explain a little farther the general idea given of it above.

Of man's first disobedience, and the fruit  
Of that forbidden tree, whose mortal taste  
Brought death into the world, and all our woe, &c,  
Sing heav'nly muse, &c.

Supposing, in reference to the above well-known lines, that originally other beings, besides men, had disobeyed the commands of the Almighty, and that the circumstance were well known to us, there would fall an *emphasis* upon the word *man's* in the first line, and hence it would be read thus:

Of *man's* first disobedience, and the fruit, &c.

But if it were a notorious truth, that mankind had transgressed in a peculiar manner more than once, the *emphasis* would fall on *first*, and the line be read,

Of man's *first* disobedience, &c.

Again, admitting death (as was really the case) to

have been an unheard-of and dreadful punishment brought upon man in consequence of his transgression; on that supposition the third line would be read,

Brought *death* into the world, &c.

But if we were to suppose mankind knew there was such an evil as death in other regions, though the place they inhabited had been free from it till their transgression; the line would run thus,

Brought death into the *world*, &c.

Now from a proper delivery of the above lines, with regard to any one of the suppositions we have chosen, out of several others that might in the same manner have been imagined, it will appear that the *emphasis* they illustrate is effected by a manifest *delay* in the pronunciation, and a tone something *fuller* and *lower* than is used in ordinary; and that its office is solely to determine the meaning of a sentence with reference to something said before, presupposed by the author, or generally acknowledged, or in order to remove an ambiguity, or a passage is capable of having more than one sense.

But, supposing in the above example, that none of the senses there pointed out were precisely the true one, and that the meaning of the lines were no other than what is obviously suggested by their simple construction, in that case it may be asked, if in reading them there should be no word dignified with the emphatical accompaniments above described? The answer is, Not one with an emphasis of the *same* kind as that we have just been illustrating; yet it is nevertheless true, that on hearing these lines well read, we shall find some words distinguished from the rest by a manner of delivery bordering a little upon it (A). And these words will be general be such as seem the most important in the sentence, or on other accounts to merit this distinction. But as at best it only enforces, *grates*, or *enlivens*, and not *fixes* the meaning of any passage, and even *caprice* and *fashion* (B) have often a hand in determining its place and magnitude, it cannot properly be reckoned an *essential* of delivery. However, it is of too much moment to be neglected by those who would wish to be good readers; and, for the sake of distinction, we may not

(A) The following lines will illustrate both these kinds of stress. For, to convey their right meaning, the word *ANY* is evidently to be pronounced louder and fuller than those which the accents over them.

Get wealth and place, if possible with *grace*.

If not, by *ANY* means get wealth and place. Pars.

This couplet is accented in the manner we find it in the *Essay on Elocution by Mason*. And, if according to the judgment of this author, the words thus distinguished are to have an emphatical stress, it must be of the inferior kind above-mentioned, and which a little farther on we call *emphasis of force*; while the word *ANY* in a different type alone possesses the other sort of energy, and which is there contradistinguished by the term *emphasis of sense*.

(B) Among a number of people who have had proper opportunities of learning to read in the best manner it is now taught, it would be difficult to find two, who, in a given instance, would use the *emphasis of force*, alike, either as to place or quantity. Nay some scarce use *any* at all: and others will not scruple to carry it much beyond any thing we have a precedent for in common discourse; and even now and then throw it upon words so very trifling in themselves, that it is evident they do it with no other view, than for the sake of the *variety* it gives to the modulation.—This practice, like the introduction of discords into music, may without doubt be indulged now and then; but were it too frequent, the capital intent of these energies would manifestly either be destroyed or rendered dubious.

not unaptly denominate both the kinds of energies in question, by the terms *emphasis of sense*, and *emphasis of force* (c.)

Now from the above account of these two species of emphasis it will appear, "that in reading, as in speaking, the first of them must be determined entirely by the *sense* of the passage, and always made *alike*: But as to the other, *taste* alone seems to have a right of fixing its situation and quantity."—Farther: Since the more essential of these two energies is solely the work of *nature* (as appears by its being *constantly* found in the common conversation of people of all kinds of capacities and degrees of knowledge), and the most ignorant person never fails of using it *rightly* in the effusions of his own heart, it happens very luckily, and ought always to be remembered, that provided we understand what we read, and give way to the dictates of our own feelings, the *emphasis of sense* can scarce ever avoid falling *consequently* upon its proper place.

It will be necessary to say something by way of *apology* for a question which will naturally occur to the reader, *Why then, as the rule for the emphasis of sense requires, we should understand what we read before it can be properly read, it is incumbent upon us never to attempt to read what we have not previously studied for that purpose?* In answer to this, it must be observed, that though such a step will not be without its advantages; yet, as from the firmness of printed types, the well-known marks of punctuation, and a long acquaintance with the phraseology and construction of our language, &c., experience tells us it is *possible* to comprehend the *sense* at the first reading, a previous perusal of what is to be read does not seem *necessary* to all, though, if they would wish to appear to advantage, it may be *expedient* to many; and it is this circumstance

which makes us venture upon *extemporary* reading, and give it a place among our amusements.—Similar remarks might be made with regard to *modulation, expression, &c.* did not what is here observed naturally anticipate them.

III. *Modulation* (d). Every person must have observed, that, in speaking, the voice is subject to an alteration of sound, which in some measure resembles the movement of a tune. These sounds, however, are evidently nothing like so much varied as those that are strictly musical; and we have attempted to show in the preceding chapter, that, besides this, they have an essential difference in themselves. Nevertheless, from the general similitude of these two articles, they possess several terms in common; and the particular we have now to examine is in both of them called *modulation*. The affection of the voice, being totally *arbitrary*, is differently characterized in different parts of the world; and, through the power of custom, every place is inclined to think their own the only one natural and agreeable, and the rest affected with some barbarous twang or ungainly variation (e). It may be observed, however, that though there is a general uniform cast or fashion of modulation peculiar to every country, yet it by no means follows, that there is or can be any thing fixed in its application to particular passages; and therefore we find different people will, in any given instance, use modulations something different, and nevertheless be each of them equally agreeable.

But, quitting these general remarks, we shall (as our purpose requires it) consider the properties of modulation a little more minutely.

First, then, we may observe, that, in speaking, there is a particular sound (or *key-note*, as it is often called) in which the modulation for the most part runs, and to which

(c) The first of these terms answers to the *simple emphasis* described in the *Lectures on Elocution*, and the second nearly to what is there called *complex*. The difference lies in this. Under *complex emphasis* the author seems (for he is far from being clear in this article) to include the *tones* simply considered of all the emotions of the mind; as well the *louder* and *languid*, as the *forcible* and *exulting*. Our term is intended to be confined to such modes of expression alone as are attended with an apparent *stress* or *increase* of the voice.

(d) The author of *readings in the Art of Reading*, not allowing that there is any variation of tone, as to *high* and *low*, in the delivery of a complete period or sentence, place modulation solely in the diversification of the key note and the variety of syllables, as to *long* or *short*, *swift* or *slow*, *strong* or *weak*, and *loud* or *soft*. As we are of a different opinion, our idea of modulation is confined purely to *harmonious inflexions of voice*. These qualities of words, it is true, add greatly both to the force and beauty of delivery; yet, since some of them are fixed and not arbitrary (as *long* and *short*), and the others (of *swift* and *slow*, *strong* and *weak*, *loud* and *soft*), may be considered as modes of expression which do not affect the modulation as to *tone*, it will agree best with our plan to esteem these properties as respectively belonging to the established laws of *pronunciation* and the *imitative* branch of expression mentioned in the end of the ensuing head.

(e) From what accounts we have remaining of the modulation of the ancients, it appears to have been highly ornamented, and apparently something not unlike our modern *recitative*; particularly that of their theatric declamation was music in its strictest sense, and accompanied with instruments. In the course of time and the progress of refinement, this modulation became gradually more and more simple, till it has now lost the genius of music, and is entirely regulated by taste. At home here, every one has heard the *sing-jong* cant, as it is called, of

Ti ti dum dum, ti ti dum ti dum de,

Ti dum ti dum, ti dum ti dum dum de;

which, though disgusting now to all but mere rustics on account of its being out of fashion, was very probably the favourite modulation in which heroic verses were recited by our ancestors. So fluctuating are the taste and practices of mankind! But whether the power of language over the passions has received any advantage from the change just mentioned, will appear at least very doubtful, when we recollect the stories of its former triumphs, and the inherent charms of musical sounds.

**Reading.** which its occasional inflections, either above or below, may in some respects be conceived to have a reference, like that which common music has to its key-note. Yet there is this difference between the two kinds of modulation, that whereas the first always concludes in the key-note, the other frequently concludes a little below it (r). This key-note, in speaking, is generally the sound given at the outset of every complete sentence or period; and it may be observed on some occasions to vary its pitch through the limits of a musical interval of a considerable magnitude. The tones, that fall a little lower than the key at the close of a sentence or period, are called *cadences*. These cadences, if we are accurate in our distinctions, will, with respect to their offices, be found of two kinds; though they meet so frequently together, that it may be best to conceive them only as answering a double purpose. One of these offices is to assist the sense, and the other to decorate the modulation. An account of the first may be seen in the section on *Pauses*; and the latter will be found to show itself pretty frequently in every thing grave and plaintive, or in poetic description and other highly ornamented language, where the mind is by its influence brought to feel a placid kind of dignity and satisfaction. These two cadences, therefore, may be conveniently distinguished by applying to them respectively the epithets *significant* and *ornamental*.

We have already observed, that reading should in some things differ from speaking; and the particular under consideration seems to be one which ought to vary a little in these arts. For,

Modulation in reading serves a twofold purpose. At the same time that it gives pleasure to the ear on the principles of harmony, it contributes through that medium to preserve the attention. And since written language (when not purely dramatical) is in general more elegant in its construction, and musical in its periods, than the oral one; and since many interesting particulars are wanting in reading, which are present in speaking, that contribute greatly to fix the regard of the hearer; it seems reasonable, in order to do justice to the language, and in part to supply the incitements of attention just alluded to, that in the former of these two articles a modulation should be used something more harmonious and artificial than in the latter. Agreeably to this reasoning, it is believed, we shall find every reader, on a narrow examination, adopt more or less a modulation thus ornamented: though, after all, it must be acknowledged there are better grounds to believe, that the practice has been hitherto directed intuitively by nature, than that it was discovered by the inductions of reason. We shall conclude this head with a rule for modulation in reading. "In every thing dramatic, colloquial, or of simple narrative, let your modulation be the same as in speaking; but when the subject is flowery, solemn, or dignified, add something to its harmony,

**Reading.** diversify the key-note, and increase the frequency of cadences in proportion to the merit of the composition."

It will readily be seen, that the precepts here drawn from a comparison between speaking and reading, would be very inadequate, were they left destitute of the assistance of *taste*, and the opportunity of *frequently hearing and imitating masterly readers*. And indeed, to these two great auxiliaries we might very properly have referred the whole matter at once, as capable of giving sufficient directions, had we not remembered that our plan required us to found several of our rules as much on the principles of a philosophical analysis, as on these more familiar ones which will be found of greater efficacy in real practice.

IV. *Expression.* 1. There is no composition in music, however perfect as to key and melody, that, in order to do justice to the subject and ideas of the author, will require, in the performing, something more than an exact adherence to *time and tone*. This something is of a nature, too, which perhaps cannot be adequately pointed out by any thing, but is to be gathered entirely from the taste and feeling of the performer. It is that which chiefly gives music its power over the passions, and characterizes its notes with what we mean by the words *sweet, harsh, soft, loud, plaintive, &c.* for it is evident, every tone, considered abstractedly, without any regard to the movement, on high and low, may be thus modified. In practical music, this commanding particular is called *expression*; and as we find certain tones analogous to it frequently coinciding with the modulation of the voice, which indicate our passions and affections (thereby more particularly pointing out the meaning of what we say), the term is usually applied in the same sense to speaking and reading.

These tones are not altogether peculiar to man. Every animal, that is not dumb, has a power of uttering several of them. And from their being able, unassisted by words, to manifest and raise their kindred emotions, they constitute a kind of language of themselves. In this language of the heart man is eminently conversant; for we not only understand it in one another, but also in many of the inferior creatures subjected by providence to our sense.

The expression here alluded to is one of the most essential articles in good reading, since it not only gives a finishing to the sense, but, on the principles of sympathy and antipathy, has also a peculiar efficacy in interesting the heart. It is likewise an article of most difficult attainment; as it appears from what follows, that a masterly reader ought not only to be able to incorporate it with the modulation properly as to *quality*, but in any degree as to *quantity*.

Every thing written being a proper imitation of speech, expressive reading must occasionally partake of all

(r) As musical sounds have always a harmonical reference to a key or fundamental note, and to which the mind is still secretly attending, no piece of music would appear perfect, that did not close in it, and so naturally put an end to expectation. But as the tones used in speech are not musical, and therefore cannot refer harmonically to any other sound, there can be no necessity that this terminating sound (and which we immediately below term the *cadence*) should either be used at all, or follow any particular law as to form, &c. farther than what is imposed by taste and custom.

*Reading.* all its tones. But from what is said above, of the difference between reading and speaking, it follows, that these signs of the emotions should be less strongly characterized in the former article than in the latter. Again, as several of these tones of expression are, in themselves agreeable to the mind, and raise in us agreeable emotions (as those of *pity, benevolence, or whatever indicates happiness, and goodness of heart,*) and others disagreeable (as those of a *boisterous, malicious, and depraved nature, &c.*) it farther appears, since reading is an art *improving* and not *imitating* nature, that, in what ever degree we abate the expressions of the tones above alluded to in the first case, it would be eligible to make a greater abatement in the latter. But as to the quantities and proportional magnitudes of these accents; these, and many other particulars of the same nature, must be left solely to the taste and judgment of the reader.

It is not without some remark, which may be of service to the reader, than in suggesting another reason for the above observations. It is to be remembered, that though the reader is not to imitate, yet, in this article of expression, he is to be so far from every reader should feel himself as if he were actually speaking; yet, that he may preserve a certain degree of steadiness of delivery, it is not necessary that he should guard against discovering too much of his own emotion.

From the foregoing we deduce the following rule, which is to be observed in the passions and emotions.

But as to the various tones of expression be borrowed from the tones of common speech, but something more is to be observed. Let those tones which signify the agreeable passion of the mind, be still more strongly marked, which indicate their contrary; and preserve himself from being affected with the subject, so as to be able to proceed through it with that perfect calmness and masterliness, which has its charms in every other art."

We shall conclude this section with the following observation, which relates to speaking as well as reading. When words fall in our way, whose "sounds seem an echo to the soul," or *trill, hum, rattle, hiss, jar, &c.* we ought not to utter them in such a manner as to heighten the sound, or to give it light and ludicrous subjects. For in such cases, it is not in any other case be sounded *firmly, and with a steady voice, &c.* On the contrary, when the imitation lies in the movement, or in the *trill, hum, rattle, hiss, &c.* (which frequently occurs in the delivery) the delivery may always be allowed to give a slight attention to it with the greatest propriety; as in the following instances, but of a number more which every experienced reader will quickly recollect.

In these deep solitudes and awful cells,  
Where heav'nly-pensive Contemplation dwells,  
And ever-musing melancholy reigns—

Pope's *Eloisa to Abelard.*

With easy course  
The vessels glide, unless their speed be stopp'd  
By dead calms, that oft lie on these smooth seas.

Dyer's *Fleets.*

Softly sweet in Lydian measures,  
Soon he sooth'd his soul to pleasures."

Dryden's *Ode on St Cecilia's day.*

Still gathering force it smokes, and, urg'd amain,  
Whirls, leaps, and thunders down impetuous to the plain.  
Pope's *Iliad*, B. XIII.

For who to dumb forgetfulness a prey,  
This pleasing anxious being ere resign'd,  
Left the warm precincts of the cheerful day,  
Nor cast one longing ling'ring look behind?

Gray's *Elegy.*

2. Besides the particular tones and modifications of Expressions, voice above described, which always accompany and express our inward agitations, nature has in these cases endowed us with another language, which, instead of the ear, addresses itself to the eye, thereby giving the communications of the heart a double advantage over those of the understanding, and us a double chance to preserve so inestimable a blessing. This language is what arises from the different, almost involuntary, movements and configurations of the face and body in our emotions and passions, and which, like that of tones, every one is formed to understand by a kind of intuition.

When men are in any violent agitation of mind, this co-operating *expression* (as it is called) of face and gesture is very strongly marked, and totally free from the mixture of any thing which has a regard to gracefulness, or what appearance they may make in the eyes of others. But in ordinary conversation, and where the emotions are not so warm, fashionable people are perpetually insinuating, into their countenance and action, whatever they imagine will add to the ease and elegance of their deportment, or impress on the spectator an idea of their amiableness and breeding. Now, though the above-mentioned natural organical signs of the emotions should accompany every thing spoken, yet from what was observed in the introductory part of this article (like the tones we have just treated upon), they should in reading be much less strongly expressed, and those suffer the greatest diminution that are in themselves the most ungainly. And as it was in the last section recommended to the reader to preserve himself as far from being affected in all passionate subjects as to be able to keep a temperate command over the various affections of the voice, &c. so under the sanction of this subordinate feeling he may accompany his delivery more frequently with an easy action or change of face, which will contribute to set off his manner, and make it agreeable on the principles of art.

As these calm decorations of action (as we may call them) are not altogether natural, but have their rise from a kind of institution, they must be modelled by the practices of the polite. And though mankind differ from one another scarce more in any particular than in that of talents for adopting the graceful actions of the body, and hence nothing determinate can be said of their nature and frequency, yet even those, most happily calculated to acquit themselves well in their use, might profit by considering that it is better greatly to abridge the display, than to over-do it ever so little. For the peculiar modesty of deportment with which the inhabitants of this kingdom are endowed, makes us in common endeavour to suppress many signs of an agitated mind; and in such cases the bodily ones in particular are very sparingly used. We have also a natural and rooted dislike to any kind of affectation; and to no species,

*Reading.* species, that we can recollect, a greater, than to that which is seen in a person who pretends to mimicry and courtly gesture, without possessing the advantages and talents they require; and of which not many people, comparatively speaking, have any remarkable share.

The inference of this is too obvious to need drawing out, and we would particularly recommend it to the consideration of those readers who think the common occurrences of a newspaper, &c. cannot be properly delivered without a good deal of elbow-room.

Although it is impossible to come to particulars in any directions of this kind, yet there is one article of our present subject on which a serviceable remark may be made. In ordinary discourse, when we are particularly pressing and earnest in what we say, the eye is naturally thrown upon those to whom we address ourselves: And in reading, a turn of this organ now and then upon the hearers, when any thing very remarkable or interesting falls in the way, has a good effect in gaining it a proper attention, &c. But this should not be too frequently used; for if so, besides its having a tendency to confound the natural importance of different passages, it may not be altogether agreeable to some to have their own reflections broken in upon by a signal, which might be interpreted to hint at their wanting regulation.

One observation more, and then we shall attempt to recapitulate the substance of this section in the form of a precept. Though it is, when strictly examined, inconsistent, both in speaking and reading, to imitate with action what we are describing, yet as in any thing comic such a practice may suggest ideas that will accord with those of the subject, it may there be now and then indulged in either of these articles.

"In a manner similar to that directed with regard to tones, moderate your bodily expressions of the signs of the emotions. And in order to supply, as it were, this deficiency, introduce into your carriage such an easy gracefulness, as may be consistent with your acquirements in these particulars, and the necessary dread which should ever be present of falling into any kind of affectation or grimace."

**V. Pauses.** Speech consisting of a succession of distinct words, must naturally be liable (both from a kind of accident, and a difficulty there may be in beginning certain sounds or portions of phrases immediately on the ending of certain others) to several small intermissions of voice; of which, as they can have no meaning, nothing farther need here be said. There are, however, some pauses, which the sense necessarily demands; and to these the substance of this section is directed.

*Reading.* The pauses are in part to distinguish the members of sentences from one another, the termination of complete periods, and to afford an opportunity for taking breath. Besides this, they have a very graceful effect in the modulation, on the same account they are so essential in music.—In both articles, like blank spaces in pictures, they set off and render more conspicuous whatever they disjoin or terminate.

Were language made up of nothing but short colloquial sentences, these pauses, though they might do no harm, and would generally be graceful, would however be superfluous as to use by the completeness and narrowness, as we may say, of the meaning. But in more diffuse language, composed of several detached sentences, and which require some degree of attention in order to take in the sense, the intermissions of voice under consideration are of the greatest service, by signifying to the mind the progress and completion of the whole passage. Now, though in extensive and differently formed periods there may be more or less of completeness of sense might be conceived of various degrees, and hence might seem to require a number of pauses equally numerous; yet, since the sense does not altogether depend upon these intermissions, and their ratios to one another, if capable of being properly defined, could not be accurately observed, grammarians have ventured to compress the whole class of pauses to reducible to the four or five kinds now in use, and whose marks and ratios are well known (17), presuming that under the eye of taste; and with the assistance of a particular to be next mentioned, they would not fail in all cases to suggest intermissions of voice suitable to the sense. But in many of these compound and complex periods, rounded with a kind of redundancy of matter, where the full sense is long suspended, and the final words are not very important, there would be some hazard of a misapprehension of the construction, had we not more evident and inflexible notice of it than that which is given by the pause. This notice is the *cadence*, referred to in the section on *Modulation*; which, as is there observed, besides the ornamental variety it affords, appears from these remarks to be a very necessary and serviceable article in peripetuous delivery.

As this cadence naturally accompanies the end of every entire sense, as above-mentioned, it may sometimes fall before the semicolon, but more generally before the comma, as well as the period: For these marks are most found to terminate a complete sense; and in these cases, the relation what follows has to what went before, is signified to the mind by the relative shortness of the stop, and the form of introducing the additional matter. Nor can any bad consequence

(17) Supposing the comma (,) one time, the semicolon (;) will be two; the colon (:) three, and the period (.) as also the marks of *interrogation* (?) and *admiration* (!) four of these times. The blank line (— or —), and the *breaks* between paragraphs, intimate still greater times; and by the same analogy may be reckoned a double and quadruple period respectively. Now and then these blank lines are placed immediately after the ordinary points, and then they are conceived only as separating for the eye the different natures of the matter;—as a question from an answer,—precept from example,—premises from inferences, &c. in which case their import is evident. But of late some authors have not scrupled to confound these distinctions; and to make a blank serve for all the pauses universally, or the mark of an indefinite rest, the quantity of which is left to the determination of the reader's taste. A practice, it is imagined, too destructive of the intended precision of these typical notices to be much longer adopted.

Readings  
Re-animat-  
tion.

of which there are large ruins remaining. It had also a castle built by King Henry I. but it was afterwards levelled with the ground. It is a corporation, enjoys several privileges, and sends two members to parliament. The two navigable rivers render it a fit place for trade. W. Long. 1. 0. N. Lat. 51. 25.

**READINGS**, or *Various Readings*, in criticism, are the different manners of reading the texts of authors in ancient manuscripts, where a diversity has arisen from the corruption of time, or the ignorance of copyists. A great part of the business of critics lies in settling the readings by confronting the various readings of the several manuscripts, and considering the agreement of the words and sense.

*Readings* are also used for a sort of commentary or gloss on a law, text, passage, or the like, to show the sense an author takes it in, and the application he conceives to be made of it.

**RE-AGGRAVATION**, in the Romish ecclesiastical law, the last monitory, published after three admonitions, and before the last excommunication. Before they proceed to fulminate the last excommunication, they publish an aggravation, and a re-aggravation. Fevret observes, that in France the minister is not allowed to come to re-aggravation, without the permission of the bishop or official, as well as that of the lay-judge. See **EXCOMMUNICATION**.

**REAL** (César Vichard de St), a polite French writer, son of a counsellor to the senate of Chamberry in Savoy. He came young to France, distinguished himself at Paris by several ingenious productions, and resided there a long time without title or dignity, intent upon literary pursuits. He died at Chamberry in 1692, advanced in years, though not in circumstances. He was a man of great parts and penetration, a lover of the sciences, and particularly fond of history. A complete edition of his works was printed at Paris, in 3 vols. 4to, 1745, and another in 6 vols. 12mo.

**REAL Presence**. See **TRANSUBSTANTIATION**.

**REALGAR**. See **CHEMISTRY**, N° 1279.

**REALISTS**, a sect of school philosophers formed in opposition to the nominalists. Under the Realists are included the Scotists, Thomists, and all excepting the followers of Ockham. Their distinguishing tenet is, that universals are realities, and have an actual existence out of an idea or imagination; or, as they express it in the schools, a *parte rei*; whereas the nominalists contend, that they exist only in the mind, and are only ideas, or manners of conceiving things. Dr Odo, or Oudard, a native of Orleans, afterwards abbot of St Martin de Tournay, was the chief of this sect of the realists. He wrote three books of dialectics, where, on the principles of Boethius and the ancients, he maintained that the object of that art is things, not words; whence the sect took its rise and name.

**REALITY**, in the schools, a diminutive of *res*, "thing," first used by the Scotists, to denote a thing which may exist of itself; or which has a full and absolute being of itself, and is not considered as a part of any other.

**REALM**; a country which gives its head or government the denomination of a *king*.

**RE-ANIMATION** means the reviving or restoring to life those who are apparently dead. Sudden death is

dreaded by every human being, and it is one of those evils against which the Church of England prays in her Litany. Accidents, however, cannot always be prevented; but, after they have happened, it is often possible to prevent their effects. This, by the establishment of what with great propriety has been called the *Humane Society*, has been abundantly proved: for, in the course of 12 years immediately after their institution, they were the means of saving the lives of 850 persons, who otherwise would in all human probability have been lost to the community. Since that period, they have saved many more; and various persons, even in the most distant parts of the kingdom, by following their directions, have done the same. To preserve one human being from premature death, we must consider as of the utmost consequence both as citizens and Christians; how much more the preservation of thousands. It appears from the writings of De la Motte, Winslow, Brubier, Fosterhill, Haller, Leclerc, Van Engelen, Gummer, and others, that they have prepared the way for institutions similar to the *Humane Society*: for in their works they have explained the principles on which they go, and furnished directions for the practice they favour. See **DEATH**, **RESUSCITATION**, **INTERMENT**, and **DROWNING**.

**REAR**, a term frequently used in composition, to denote something behind, or back, in respect of another; in opposition to *anterior*.

**REAR of an Army**, signifies, in general, the hindermost part of an army, battalion, regiment, or squadron; also the ground behind either.

**REAR-Guard**, is that body of an army which marches after the main body; for the march of an army is always composed of an advance-guard, a main body, and a rear-guard; the first and last commanded by a general. The old grand-guards of the camp always form the rear-guard of the army, and are to see that nothing comes safe to the new camp.

**REAR Half-file**, are the three hindmost ranks of the battalion, when it is drawn up for deep.

**REAR-Line** of an army encamped, is always 1200 feet at least from the centre line, both of which run parallel to the front and back of the camp.

**REAR Rank**, is the last rank of a battalion, when drawn up, and generally is the 12 feet from the centre line when drawn up for deep.

**REASON**, a faculty or power of the mind, whereby it distinguishes good from evil, truth from falsehood. See **MATHEMATICS**.

**REASONING**, a reasoning, the exercise of that faculty of the mind called *reason*; or it is an act or operation of the mind, deducing some unknown proposition from other previous ones that are evident and known. See **LOGIC**, Part III.

**REAUMUR** (Rene Antoine Ferchault, Sieur de), a person distinguished for his laborious researches into natural knowledge, was born at Rochelle in 1683, of a family belonging to the law. After having finished his early studies in the place of his birth, he began a course of philosophy at Poitiers, and of civil law at Bourges; but soon relinquished the latter, to apply himself, according to his taste, to mathematics, physics, and natural history. Being come to Paris, he was received into the Academy of Sciences in 1708. From that hour he was wholly employed in natural history, to which his inclination

Rear  
Reaumur.

Reaumur. clination particularly led him, and his inquiries were not confined to any one part of it. His memoirs, his observations, his discoveries on the formation of shells, spiders, muscles, the marine flea, the berry which affords the purple colour, and on the cause of the numbness of the torpedo, excited the curiosity of the public, and early procured our author the character of an able, curious, and entertaining naturalist. Filled with zeal for the welfare and advantage of society, and the progress and perfection of arts, he endeavoured in all his researches to promote the public good. We were indebted to him for the discovery of the *Tunquias* mines in Languedoc. He also found out a substance, which is used to give false stones a colour, which is obtained from a certain fish called in the French *Abbe* or *Abbe* on account of its whiteness, and which is the *Blanc* or *Blanc* of our writers. His experiments on the art of curing iron, &c. &c. obtained him a pension of 12,000 livres, and his reward was to be continued to the Academy to support the expense which might accrue in his inquiries on the art of making tin. He endeavoured to render our thermometers more accurate than those of former times: he composed a curious history of rivers where gold dust is found in France, and gave so simple and easy a detail of the method of gathering this dust, that persons have been employed for that purpose.

\* See *Belon*, 319; and *Pennant's Zoology*, Vol. III. p. 345.  
† See *Copernicus*, N. 9.  
‡ See *Pennant's Zoology*.

His observations and important observations on the nature of plants, on the banks of fossil shells, from which he obtained in Touraine an excellent manure for the use of his gardens and their preservation, on their growth, on the nature of insects; and a great number of other inquiries, not less curious than useful. He discovered that a certain varnish would keep things dry, but the waste of time and money, &c. rendered the inconvenience of such a process. He discovered the method practised for time immemorial in Greece and the islands of the Archipelago, which is to keep or immerse eggs in oil, or melted fat; by this means, the eggs are exposed to the air or to frost, they are well preserved, and without bad smell. Another experiment, made by our author was to keep eggs in oil, and to hatch them in a warm place, and to hatch them without covering the eggs. Active, sedulous, and industrious in his study, often at the expense of his health, he in his experiments and observations, he was sometimes escape him. His writings are so full of facts, that they are philosophers. In fact, he was a man of great life for his modest and agreeable character. His probity, benevolence, goodness of heart, and other amiable qualities, as well natural as acquired, endeared him to his countrymen. He died in the 76th year of his age, on the 18th of October 1757, and left this world filled with sentiments of piety. His death was the consequence of a fall, which happened at the castle of Barnardiere on the Maine, where he went to pass his vacation. He bequeathed to the Academy of Sciences his manuscripts and all his natural productions. His works are, 1. A very great number of memoirs and observations on different parts of natural history; they are printed in the collections of the Academy of Sciences. 2. A large work printed separately in 6 vols. in 4to, entitled, *A Natural History of Insects*. This important

work contains a description of vast numbers of caterpillars, moths, gall insects, flies with two and four wings, lady-birds, and those ephemeron flies which live only in that form a few hours; and lastly, of those singular and wonderful insects which are called *polytes*, which being cut into several pieces, each piece lives, grows, and becomes an insect, and affords to our eyes a great number of prodigies. The works of M. de Reaumur are exact, curious, interesting, and very ingenious. They are written with much candour, clearness, and elegance; but it must be acknowledged his manner is somewhat too diffuse. But we must not deceive the reader; he often raises our expectations, and does not give us all the satisfaction we promise ourselves from his writings. His method of raising poultry, in particular, rather disappoints us. He spared neither care, time, nor expence, to render it practicable: he flattered himself and his countrymen with the greatest hopes; but notwithstanding his assiduous industry, and vast charges, it proved abortive. The late M. l'Advocat recommended him to obtain better information from Egypt on the subject; and if possible to procure a person versed in the art to instruct him in it; but his death prevented the completion of the scheme. If the native of Egypt had arrived, showed M. de Reaumur a better method than his own, and practised it with success, as in his country, the community would have been benefited, on the other hand he would have seen, had it failed, that the climate of France was not proper for such experiments. M. Maillet, consul at Cairo, to whom Monsieur the regent had written to obtain the art, offered to send over a native of Egypt, if the government would pay the expence of his voyage, and allow him a pension of 1500 livres. M. Maillet rightly judged, when he preferred this method of proceeding. M. de Reaumur was not ignorant of the design; but he flattered himself, that his efforts would be successful without further aid, and thought he should acquire some honour. He certainly had great talents, industry, sagacity, and every other requisite which are necessary in such attempts; but it is morally impossible that a single man, in a different climate, can attain such knowledge in an art as those who live in a more favourable country, and have had the experience of many ages to profit by: however M. de Reaumur may have been unsuccessful, posterity is indebted to him for his repeated trials. He has removed some difficulties in the road, and those that travel it may discover what he only saw at a distance.

REAUMURIA, in botany: A genus of the pentagynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 13th order, *Succulentæ*. The calyx is hexaphyllous, and there are five petals; the capsule is unilocular, quinquevalved, and polyspermous.

REBATE, or REBATEMENT, in commerce, a term much used at Amsterdam for an abatement in the price of several commodities, when the buyer, instead of taking time, advances ready money.

REBATEMENT, in heraldry, a diminution or abatement, of the bearings in a coat of arms. See ABATEMENT.

REBELLION, *Rebellio*, among the Romans, was where those who had been formerly overcome in battle, and yielded to their subjection, made a second resistance: but with us it is generally used for the taking

Reaumur  
Rebellion

**Rebellious** up of arms traiterously against the king, whether by natural subjects, or others when once subdued; and the word *rebel* is sometimes applied to him who wilfully breaks a law; also to a villain disobeying his lord.

**Rebutter.**

There is a difference between enemies and rebels. Enemies are those who are out of the king's allegiance: therefore subjects of the king, either in open war, or rebellion, are not the king's enemies, but traitors. And David prince of Wales, who levied war against Edw. I. because he was within the allegiance of the king, had sentence pronounced against him as a traitor and rebel. Private persons may arm themselves to suppress rebels, enemies, &c.

**REBELLIOUS ASSEMBLY**, is a gathering together of twelve persons or more, intending or going about to practise or put in use unlawfully, of their own authority, any thing to change the law or statutes of the realm; or to destroy the enclosures of any ground, or banks of any fish pond, pool, or conduit, to the intent the same shall be waste and void; or to destroy the deer in any park, or any warren of conies, dove-houses, or fish in ponds; or any house, barns, mills, or bays; or to burn stacks of corn; or abate rents, or prices of victuals, &c.

**REBUS**, an enigmatical representation of some name, &c. by using figures or pictures instead of words, or parts of words. Camden mentions an instance of this absurd kind of wit in a gallant who expressed his love to a woman named *Rose Hill*, by painting in the border of his gown a rose, a hill, an eye, a loaf, and a well; which in the style of the rebus, reads, "*Rose Hill I love well.*" This kind of wit was long practised by the great, who took the pains to find devices for their names. It was however, happily ridiculed by Ben Johnson, in the humours description of Abel Drugger's device in the Alchemist; by the Spectator, in the device of Jack of Newbury; at which time the rebus, being raised to sign posts, was grown out of fashion at court.

**REBUS** is also used by the chemical writers sometimes to signify sour milk, and sometimes for what they call the ultimate matter of which all bodies are composed.

**REBUS**, in heraldry, a coat of arms which bears an allusion to the name of the person; as three castles, for Castleton; three cups, for Butler; three conies, for Conisby; a kind of bearings which are of great antiquity.

**REBUTTER**, (from the Fr. *banter*, i. e. *repellere*, to put back or bar), is the answer of defendant to plaintiff's *surrejoinder*; and plaintiff's answer to the rebutter is called a *surrebutter*: but it is very rare the parties go so far in pleading.

Rebutter is also where a man by deed or fine grants to warranty any land or hereditament to another; and the person making the warranty, or his heir, sues him to whom the warranty is made, or his heir or assignee, for the same thing; if he who is so sued plead the deed or fine with warranty, and pray judgment, if the plaintiff shall be received to demand the thing which he ought to warrant to the party against the warranty in the deed, &c. this is called a *rebutter*. And if I grant to a tenant to hold without impeachment of waste, and afterwards implead him for waste done, he may debar me of this action by showing my grant, which is a rebutter.

**RECAPITULATION**, is a summary or a concise and transient enumeration of the principal things insisted on in the preceding discourse, whereby the force of the whole is collected into one view. See ORATORY, N<sup>o</sup> 37. and 127.

**RECEIPT**, or **RECEIT**, in commerce, an acquittance, or discharge, in writing, intimating that the party has received a certain sum of money, either in full for the whole debt, or in part, or on account.

**RECEIVER**, in pneumatics, a glass vessel for containing the thing on which an experiment in the air-pump is to be made.

**RECEIVER**, *receptor* or *receptator*, in law, is commonly understood in a bad sense, and used for such as knowingly receive stolen goods from thieves, and conceal them. This crime is felony, and the punishment is transportation for 14 years.

**RECENSIO**, was an account taken by the censors, every lustrum, of all the Roman people. It was a general survey, at which the equites, as well as the people, were to appear. New names were added upon the censor's list, and old ones cancelled. The *recensio*, in short, was a more solemn and accurate sort of *prolatio*, and answered the purpose of a review, by showing who were fit for military service.

**RECEPTACULUM**, in botany, one of the seven parts of fructification, defined by Linnaeus to be the base which connects or supports the other parts.

**RECEPTACULUM Chyli**, or *Pecquet's Reservoir*, the reservoir or receptacle for the chyle, situated in the left side of the upper vertebra of the loins, under the aorta and the vessels of the left kidney.

**RECHABITES**, a kind of religious order among the ancient Jews, instituted by Jothab, the son of Rechab, comprehending only his own family and posterity. Their founder prescribed them three things: first, not to drink any wine; secondly not to build any houses, but to dwell in tents; and thirdly, not to sow any corn, or plant vines.

The Rechabites observed these rules with great strictness, as appears from Jer. xxxv. 6, &c. Whence St Jerome, in his 13th epistle to Paulinus, calls them *monachi, monks*. Jothab, their founder, lived under Jehoash, king of Judah, contemporary with Jhu king of Israel; his father Rechab, from whom his posterity were denominated, descended from Balaqel or Jethro, father-in-law to Moses, who was a Kenite, or of the race of Ken: whence Kenites and Rechabites are used as synonymous in Scripture.

**RECHEAT**, in hunting, a lesson which the huntsman plays on the horn, when the hounds have lost their game, to call them back from pursuing a counter scent.

**RECIPE**, in medicine, a prescription, or remedy, to be taken by a patient: so called because always beginning with the word *recipe*, i. e. *take*; which is generally denoted by the abbreviation R.

**RECIPROCAL**, in general, something that is mutual, or which is returned equally on both sides, or that affects both parties alike.

**RECIPROCAL Terms**, among logicians, are those which have the same signification; and consequently are convertible, or may be used for each other.

**RECIPROCAL**, in mathematics, is applied to quantities

Recapitulation  
tion  
Reciprocal

Reciprocities which multiplied together produce unity. Thus

Recluse.  $\frac{1}{x}$  and  $x$   $y$  and  $\frac{1}{y}$ , are reciprocal quantities. Likewise

$\frac{1}{x}$  is said to be the reciprocal of  $x$ , which is again the

reciprocal of  $\frac{1}{x}$ .

RECIPROCAL Figures, in geometry, those which have the antecedents and consequence of the same ratio in both figures.

RECIPROCAL Proportion, is when in four numbers the fourth is less than the second by so much as the third is greater than the first, and *vice versa*. See PROBATION and ARITHMETIC, Chap. VI. Great use is made of this reciprocal proportion by Sir Isaac Newton and others, in demonstrating the laws of motion.

RECITAL, in law, means the rehearsal or making mention in a deed or writing of something which has been done before.

RECITATIVO, or RECITATIVE, is music, a kind of song, that differs but little from ordinary pronunciation, such as that in which the several parts of the liturgy are rehearsed in cathedrals; or that wherein the actors commonly deliver themselves on the theatre at the opera, when they are to express some action or passion; to relate some event; or reveal some design.

RECKENBACHEN, a strong town of Cologne, in Germany, in the middle territory of that name. The abbot of the monastery has power of punishing offenders with death, and the abbot is obliged to the vow of chastity.

RECKONING, or a Ship's RECKONING, in navigation, is that account whereby at any time it may be known where the ship is, and on what course or courses she is to steer, in order to gain her port; and that account taken from the log board is called the *dead reckoning*. See NAVIGATION.

RECLAIMING, or RECLAMING, in our ancient customs a lord's pursuing, prosecuting, and recalling his vassal, who had gone to live in another place without his permission.

Reclaiming is said also of the demanding of a person, or thing, to be returned, as to the prince or state to which it properly belongs, when, by any irregular means, it is come into another's possession.

RECLAIMING, in falconry, is calling a hawk, &c. and making her gentle and tame.

A partridge is said to *reclaim* when she calls her young ones together, upon their scattering too much from her.

RECLINATION of a plane in dialling. See DIALLING.

RECLUSE, among the Papists, a person shut up in a small cell of an hermitage, or monastery, and cut off, not only from all conversation with the world, but even with the house. This is a kind of voluntary imprisonment, from a motive either of devotion or penance.

The word is also applied to incontinent wives, whom their husbands procure to be thus kept in perpetual imprisonment in some religious house.

Recluses were anciently very numerous. They took an oath never to stir out of their retreat: and having entered it, the bishop set his seal upon the door; and the recluse was to have every thing necessary for the support of life conveyed to him through a window. If

he was a priest, he was allowed a small oratory, with a window, which looked into the church, through which he might make his offerings at the mass, hear the singing, and answer those who spoke to him; but this window had curtains before it, so that he could not be seen. He was allowed a little garden, adjoining to his cell, in which he might plant a few herbs, and breathe a little fresh air. If he had disciples, their cells were contiguous to his, with only a window of communication, though which they conveyed necessities to him, and received his instructions. If a recluse fell sick, his door might be opened for persons to come in and assist him, but he himself was not to stir out.

RECOGNITION, in law, an acknowledgment; a word particularly used in our law books for the first chapter of the statute 1 Jac. I. by which the parliament acknowledged, that, after the death of Queen Elizabeth, the crown had rightly descended to King James.

RECOGNIZANCE, in law, is an obligation of record, which a man enters into before some court of record or magistrate duly authorized, with condition to do some particular act; as to appear at the assizes, to keep the peace, to pay a debt, or the like. It is in most respects like another bond: the difference being chiefly this, that the bond is the creation of a fresh debt or obligation *de novo*, the recognizance is an acknowledgment of a former debt upon record; the form whereof is, "that A. B. doth acknowledge to owe to our lord the king, to the plaintiff, to C. D. or the like, the sum of ten pounds," with condition to be void on performance of the thing stipulated: in which case the king, the plaintiff, C. D. &c. is called the cognizee, *is cui cognoscitur*; as he that enters into the recognizance is called the cognizor, *is qui cognoscit*. This being certified to, or taken by the officer of some court is witnessed only by the record of that court, and not by the party's seal: so that it is not in strict propriety a deed, though the effects of it are greater than a common obligation; being allowed a priority in point of payment, and, binding the lands of the cognizor from the time of enrolment on record.

RECOIL, or REBOUND, the starting backward of a fire-arm after an explosion. Merfennus tells us, that a cannon 12 feet in length, weighing 6400lb. gives a ball of 24lb. an uniform velocity of 640 feet per second. Putting, therefore,  $W = 6400$ ,  $w = 24$ ,  $V = 640$ , and  $v =$  the velocity with which the cannon recoils; we shall have (because the momentums of the cannon and ball are equal)  $Wv = wV$ ; and so  $v = \frac{wV}{W} =$

$\frac{24 \times 64}{6400} = 2,4$ ; that is, it would recoil at the rate of 2,4 feet per second, if free to move.

RECOLLECTION, a mode of thinking, by which ideas sought after by the mind are found and brought to view.

RECONNOITRE, in military affairs, implies to view and examine the state of things, in order to make a report thereof.

Parties ordered to reconnoitre are to observe the country and the enemy; to remark the routes, conveniences, and inconveniences of the first; the position, march, or forces of the second. In either case, they should have an expert geographer, capable of taking plans

Recogni-  
tion  
Recon-  
noitre

Record  
||  
Recovery.

plans readily: he should be the best mounted of the whole in case the enemy happen to scatter the escorte, that he may save his works and ideas. See WAR.

**RECORD**, an authentic testimony in writing, contained in rolls of parchment, and preserved in a court of record. See COURT.

**Trial by Record**, a species of trial which is used only in one particular instance: and that is where a matter of record is pleaded in any action, as a fine, a judgment, or the like; and the opposite party pleads, *nul tiel record*, that there is no such matter of record existing. Upon this, issue is tendered and joined in the following form, "and this he prays may be inquired of by the record, and the other doth the like;" and hereupon the party pleading the record has a day given him to bring it in, and proclamation is made in court for him to "bring forth the record by him in pleading alleged, or else he shall be condemned;" and, on his failure, his antagonist shall have judgment to recover. The trial, therefore, of this issue, is merely by the record: for, as Sir Edward Coke observes, a record or enrolment is a monument of so high a nature, and importeth in itself such absolute verity, that if it be pleaded that there is no such record, it shall not receive any trial by witness, jury, or otherwise, but only by itself. Thus titles of nobility, as whether earl or not earl, baron or not baron, shall be tried by the king's writ or patent only, which is matter of record. Also in case of an alien, whether alien friend or enemy, shall be tried by the league or treaty between his sovereign and ours; for every league or treaty is of record. And also, whether a manor be held in ancient demesne or not, shall be tried by the record of domesday in the king's exchequer.

**RECORDER**, a person whom the mayor and other magistrates of a city or corporation associate to them, for their better direction in matters of justice and proceedings in law; on which account this person is generally a counsellor, or other person well skilled in the law.

The recorder of London is chosen by the lord mayor and aldermen; and as he is held to be the mouth of the city, delivers the judgment of the courts therein, and records and certifies the city-customs. See LONDON, N<sup>o</sup> 38.

**RECOVERY**, or *Common Recovery*, in English law, a species of assurance by matter of record; concerning the original of which it must be remarked, that common recoveries were invented by the ecclesiastics to elude the statutes of mortmain (see TAIL); and afterwards encouraged by the finesse of the courts of law in 12 Edward IV. in order to put an end to all fettered inheritances, and bar not only estates-tail, but also all remainders and reversions expectant thereon. We have here, therefore, only to consider, first, the nature of a common recovery; and, secondly, its force and effect.

1. A common recovery is a suit or action, either actual or fictitious: and in it the lands are recovered against the tenant of the freehold; which recovery, being a supposed adjudication of the right, binds all persons, and vests a free and absolute fee-simple in the recoverer. To explain this as clearly and concisely as possible, let us, in the first place, suppose David Edwards to be tenant of the freehold, and desirous to suffer a common recovery, in order to bar all entails, remain-

ders, and reversions, and to convey the same in fee-simple, to Francis Golding. To effect this, Golding is to bring

Recovery.  
sues out a writ called a *precipe quod reddat*, because these were its initial or most operative words when the law-proceedings were in Latin. In this writ the demandant Golding alleges, that the defendant Edwards (here called the tenant) has no legal title to the land; but that he came into possession of it after one Hugh Hunt had turned the demandant out of it. The subsequent proceedings are made up into a record or recovery roll, in which the writ and complaint of the demandant are first recited: whereupon the tenant appears, and calls upon one Jacob Morland, who is supposed, at the original purchase, to have warranted the title to the tenant; and thereupon he prays, that the said Jacob Morland may be called in to defend the title which he so warranted. This is called the *vouch*, "*vocation*," or calling of Jacob Morland to warranty; and Morland is called the *vouchee*. Upon this Jacob Morland, the *vouchee*, appears, is impleaded, and defends the title. Whereupon Golding the demandant desires the court to imparl, or confer with the *vouchee*, which is (as usual) allowed him. And soon afterwards the demandant Golding returns to court; but Morland the *vouchee* disappears, or makes default. Whereupon judgment is given for the demandant Golding, now called the *recoverer*, to recover the lands in question against the tenant Edwards, who is now the *recoverer's* tenant; and Edwards has judgment to recover of Jacob Morland lands of equal value, in recompense for the lands so warranted by him, and now lost by his default; which is agreeable to the doctrine of warranty mentioned in the preceding chapter. This is called the *recompense*, or *recovery in value*. But Jacob Morland having no lands of his own, being usually the clerk of the court, who, from being frequently thus vouched, is called the *common vouchee*, it is plain that Edwards has only a nominal recompense for the lands so recovered against him by Golding; which lands are now absolutely vested in the said recoverer by judgment of law, and seisin thereof is delivered by the sheriff of the county. So that this collusive recovery operates merely in the nature of a conveyance in fee-simple, from Edwards the tenant in tail to Golding the recoverer.

The recovery here supposed, is with a single voucher only; but sometimes it is with a double, treble, or farther voucher, as the exigency of the case may require. And indeed it is now usual always to have a recovery with double voucher at the least: by first conveying an estate of freehold to any indifferent person, against whom the *precipe* is brought; and then he vouches the tenant in tail, who vouches over the common vouch. For, if a recovery he had immediately against tenant in tail, it bars only such estate in the premises of which he is then actually seised; whereas if the recovery be had against another person, and the tenant in tail be vouched, it bars every latent right and interest which he may have in the hands recovered. If Edwards therefore be tenant of the freehold in possession, and John Barker be tenant in tail in remainder, here Edwards doth first vouch Barker, and then Barker vouches Jacob Morland the common vouchee; who is always the last person vouched, and always makes default; whereby the demandant Golding recovers the land against the tenant Edwards,

Blackst.  
Comment.

**Recovery.** Edwards, and Edwards recovers a recompense of equal value against Barker the first vouchee; who recovers the like against Morland the common vouchee, against whom such ideal recovery in value is always ultimately awarded.

This supposed recompense in value is the reason why the issue in tail is held to be barred by a common recovery. For, if the recoverer should obtain a recompense in lands from the common vouchee (which there is a possibility in contemplation of law, though a very improbable one, of his doing), these lands would supply the place of those so recovered from him by collusion, and would descend to the issue in tail. The reason will also hold with equal force as to most remaindermen and reversioners, to whom the possibility will remain, and revert, as a full recompense for the reality which they were otherwise entitled to: but it will not always hold; and therefore, as Pigott says, the judges have been very *adroit*, in inventing other reasons to support the authority of recoveries. And, in particular, it hath been said, that though the estate-tail is barred by the recovery, yet it is not destroyed, but only suspended, and still subsists; and will ever continue to subsist (by construction of law) in the recoverer, his heirs and assigns: and as the estate-tail so continues to subsist for ever, the remainders or reversioners dependent on the determination of such estate-tail can never take place.

To such *subtle* and *subtile*, such subtle refinements, and such *ingenious* reasoning, were our ancestors obliged to have recourse, in order to get the better of that stubborn statute *de donis*. The design for which these contrivances were set on foot, was certainly laudable; the suppressing the fetters of estates-tail, which were attended with a legion of mischiefs to the commonwealth: but, while we applaud the end, we cannot but admire the means. Our modern courts of justice have indeed adopted a more manly way of treating the subject; by considering common recoveries in no other light than as the formal mode of conveyance by which tenant in tail is enabled to alienate his lands. But, since the ill consequences of *feudal* inheritances are now generally seen and allowed, and of course the utility and expedience of *feudal* laws at present are apparent, it hath often been wished, that the *statute de donis* conveyance was shortened, and rendered more *practicable*, by either totally repealing the *statute de donis*, which perhaps, by reviving the *statute de donis*, might give birth to *new* mischiefs; or by vesting in every tenant in tail, at all ages, the same absolute fee-simple at once, which now he may obtain whenever he pleases, by the collusive fiction of a common recovery; though this might possibly bear hard upon those in remainder or reversion, by abridging the chances they would otherwise frequently have, as no recovery can be suffered in the intervals between term and term, which sometimes continue for near five months together: or, lastly, by empowering the tenant in tail to bar the estate-tail by a solemn deed, to be made in term time, and enrolled in solemn court of record; which is liable to neither of the other objections, and is warranted not only by the usage of our American colonies, but by the precedent of the statute 21 Jac. I. c. 19. which, in the case of a bankrupt tenant in tail, empowers his commissioners to sell the estate at any time, by deed indented and enrolled. And if, in so national

a concern, the emoluments of the officers concerned in passing recoveries are thought to be worthy attention, those might be provided for in the fees to be paid upon each enrollment.

2. The force and effect of common recoveries may appear, from what has been said, to be an absolute bar not only of all estates tail, but of remainders and reversions expectant on the determination of such estates. So that a tenant in tail may, by this method of assurance, convey the lands held in tail to the recoverer, his heirs and assigns, absolutely free and discharged of all conditions and limitations in tail, and of all remainders and reversions. But, by statute 34 and 35 H. VIII. c. 20. no recovery had against tenant in tail of the king's gift, whereof the remainder or reversion is in the king, shall bar such estate-tail, or the remainder or reversion of the crown. And by the statute 11 H. VII. c. 20. no woman, after her husband's death, shall suffer a recovery of lands settled on her by her husband, or settled on her husband and her by any of his ancestors. And by statute 14 Eliz. c. 8. no tenant for life, of any sort, can suffer a recovery so as to bind them in remainder or reversion. For which reason, if there be tenant for life, with remainder in tail, and other remainders over, and the tenant for life is desirous to suffer a valid recovery, either he, or the tenant to the *præcipe* by him made, must vouch the remainder-man in tail, otherwise the recovery is void: but if he does vouch such remainder-man, and he appears and vouches the common vouchee, it is then good; for if a man be vouched and appears, and suffers the recovery to be had, it is as effectual to bar the estate-tail as if he himself were the recoverer.

In all recoveries, it is necessary that the recoverer, or tenant to the *præcipe*, as he is usually called, be actually seized of the freehold, else the recovery is void. For all actions to recover the seisin of lands must be brought against the actual tenant of the freehold, else the suit will lose its effect; since the freehold cannot be recovered of him who has it not. And, though these recoveries are in themselves fabulous and fictitious, yet it is necessary that there be *adversus fabula*, properly qualified. But the nicety thought by some modern practitioners to be requisite in conveying the legal freehold, in order to make a good tenant to the *præcipe*, is removed by the provisions of the statute 14 Geo. II. c. 20. which enacts, with a retrospect and conformity to the ancient rule of law, that, though the legal freehold be vested in leasees, yet those who are entitled to the next freehold estate in remainder, or reversion, may make a good tenant to the *præcipe*; and that, though the deed or fine which creates such tenant be subsequent to the judgment of recovery, yet if it be in the same term, the recovery shall be valid in law: and that though the recovery itself do not appear to be entered, or be not regularly entered on record, yet the deed to make a tenant to the *præcipe*, and declare the uses of the recovery, shall after a possession of 20 years be sufficient evidence on behalf of a purchaser for valuable consideration, that such recovery was duly suffered.

RECOVERY of persons drowned, or apparently dead. See RE-ANIMATION, and the articles there referred to.

RECREANT, COWARDLY, *Faint-hearted*; formerly a word very reproachful. See BATTEL.

RECREMENT, in chemistry, some superfluous matter separated from some other that is useful; in which,

**Recrimin-** which sense it is the same with *scoria, faces*, and *encre-*  
**tion** *ments*.

**Rectory.**

**RECRIMINATION**, in law, an accusation brought by the accused against the accuser upon the same fact.

**RECRUITS**, in military affairs, new-raised soldiers designed to supply the place of those who have lost their lives in the service, or who are disabled by age or wounds.

**RECTANGLE**, in geometry, the same with a right-angled parallelogram. See *GEOMETRY*.

**RECTIFICATION**, in chemistry, is nothing but the repetition of a distillation or sublimation several times, in order to render the substance purer, finer, and freer from aqueous and earthy parts.

**RECTIFICATION of Spirits.** See *DISTILLATION*.

**RECTIFIER**, in navigation, an instrument consisting of two parts, which are two circles, either laid one upon, or let into the other, and so fastened together in their centres that they represent two compasses, one fixed, the other moveable; each of them divided into the 32 points of the compass, and 360°, and numbered both ways, from the north and the south, ending at the east and west, in 90°.

The fixed compass represents the horizon, in which the north and all the other points of the compass are fixed and immoveable.

The moveable compass represents the mariner's compass; in which the north and all other points are liable to variation.

In the centre of the moveable compass is fastened a silk thread, long enough to reach the outside of the fixed compass. But if the instrument be made of wood, there is an index instead of the thread.

Its use is to find the variation of the compass, to rectify the course at sea; having the amplitude or azimuth given.

**RECTIFYING the GLOBE.** See *GEOGRAPHY*, p. 656.

**RECTILINEAR**, in geometry, right-lined; thus figures whose perimeter consists of right lines, are said to be rectilinear.

**RECTITUDE**, in philosophy, refers either to the act of judging or of willing; and therefore whatever comes under the denomination of rectitude, is either what is true or what is good, these being the only objects about which the mind exercises its two faculties of judging and willing.

Moral rectitude, or uprightness, is the choosing and pursuing those things which the mind, upon due inquiry and attention, clearly perceives to be good; and avoiding those that are evil. See *MORAL PHILOSOPHY*.

**RECTOR**, a term applied to several persons whose offices are very different: as, 1. The rector of a parish is a clergyman that has the charge and care of a parish, and possesses all the tithes, &c. 2. The same name is also given to the chief elective officer in several foreign universities, particularly in that of Paris, and also in those of Scotland. It is also applied to the head master of large schools in Scotland, as in the high school of Edinburgh. 3. Rector is also used in several convents for the superior officer who governs the house: and the Jesuits give this name to the superiors of such of their houses as are either seminaries or colleges.

**RECTORY**, a parish-church, parsonage, or spiritual living, with all its rights, tithes, and glebes.

**RECTORY** is also sometimes used for the rector's mansion or parsonage-house.

**RECTUM**, in anatomy, the third or large intestines or guts. See *ANATOMY*.

**RECTUS**, in anatomy, a name common to several pairs of muscles, so called on account of the straightness of their fibres.

**RECUPERATORES**, among the Romans, were commissioners appointed to take cognizance of private matters in dispute, between the subjects of the state and foreigners, and to take care that the former had justice done them. It came at last to be used for commissioners, to whom the prætor referred the determination of any affair between one subject and another.

**RECURRENTS**, in anatomy, a name given to several large branches of nerves sent out by the par vagum from the upper part of the thorax to the larynx.

**RECURVIROSTRA**, in ornithology; a genus belonging to the order of grallæ of Linnæus, and that of palmipedes of Pennant and Latham. The bill is long, subulated, bent back, sharp and slender at the point. The feet are webbed, and furnished with three toes forwards, and a short one behind. Latham notes of this genus three species, viz. the *Australis*, or the one commonly known, the *Americana*, and the *Alba*. This last, it is probable, has been mistaken for the *Americana*. The recurvirostra avoseta is about the size of a lapwing in body, but has very long legs. The substance of the bill is soft, and almost membranous at its tip; it is thin, weak, slender, compressed horizontally, and incapable of defence or effort. These birds are variegated with black and white, and during the winter are frequent on the eastern shores of Great Britain. They visit also the Severn, and sometimes the ponds of Shropshire. They feed on worms and insects, which they scoop out of the sand with their bills. They lay two eggs, white, with a greenish hue, and large spots of black; these eggs are about the size of a pigeon's. They are found also in various parts of the continent of Europe, in Russia, Denmark, and Sweden, but they are not numerous. They are also found in Siberia, but oftener about the salt lakes of the Tartarian desert, and about the Caspian sea. They are found likewise on the coasts of Picardy in France in April and November, and at Ostend, but rarely. In breeding-time they are very plentiful on the coast of Bas Poitou. They do not appear to winter farther south in Europe than Italy. Whether from the bill or address, the avoset shuns snags, and is not easily taken. The American avoset is rather larger and longer than the last. The bill is similar, and its colour black: the forehead is dusky white: the head, neck, and upper part of the breast, are of a deep cream colour: the lower parts of the neck behind white: the back is black, and the under parts from the breast pure white: the wings are partly black, partly white, and partly ash-coloured. These birds inhabit North America, and were found by Dampier in Shark's Bay, on the coast of New Holland. See Plate CCCCXXXV.

The recurvirostra, or scolopax alba, is about 14 inches and a quarter long, its colour white, the inferior coverts of its wings dusky, its bill orange, its legs brown. Edwards remarks, that the bill of this bird is bent upwards, as in the avoset; its bill black at the tip, and orange the rest of its length; all the plumage is white, except

**Rectory**  
**Recurvi-**  
**rostra.**

*Recusants*, except a tint of yellowish on the great quills of the wing and of the tail. Edwards supposes, that the whiteness is produced by the cold climate of Hudson's bay, from which he received it, and that they resume their brown feathers during the summer. It appears that several species of this bird have spread further into America, and have even reached the southern provinces: for Sloane found our third species in Jamaica; and Fernandez seems to indicate two of them in New Spain, by the names *chiquatotol* and *elotol*; the former being like our woodcock, and the latter lodging under the stalks of maize.

A bird of this kind, Mr Latham says, was sent from Hudson's bay, and from the figure has every appearance of an avoet; however, in Edwards's plate, the toes appear cloven to the bottom; a circumstance seeming to overturn the supposition, and only to be authenticated when other specimens shall have come under the eye of the well-informed naturalist.

**RECUSANTS**, such persons as acknowledge the pope to be the supreme head of the church, and refuse to acknowledge the king's supremacy; who are called *Popish recusants*. The penal laws against Popery are now abolished in Britain and Ireland; and it is all probability they will quickly be allowed the ample privilege.

**RED**, one of the colours called *simple* or *primary*: being one of the three into which the light naturally divides when transmitted through a prism. See *Optics*.

**RED**, in painting, see that article.—Some reckon six kinds of red, viz. scarlet-red, crimson-red, madder-red, half-grain red, lively orange-red, and scarlet of cochineal; but it is easy to see that there can be but one proper species of red; namely the reflection of the light exactly in such a manner as it is refracted by the prism; all other shades being adulterations of that pure colour, with yellow, brown, &c.

**RED**, in heraldry. See **GULES**.

**RED-BIRD**. See **MURCICAPA**, No 7.

**RED-BREAST**, in ornithology. See **MOTACILLA**.

**RED-BOOK**, the name of an ancient record or manuscript, containing the description of the king's remembrancer, consisting of a collection of treaties relating to the times before the reign of Henry VII.

**RED-LEAD**. See **CUSCUS**, No 12.

**RED PRECIPITATE**, of Mars. See **QUARTZ**, No 764.

**RED-RUSSIA**, or *Little Russia*, a province of Poland, bounded on the west by Upper Poland, on the north by Lithuania, on the east by the country of Little Tartary, and on the south by Moldavia, Transylvania, and a part of Hungary. It comprehends Russia properly so called, Volhinia, and Podolia. It is about 650 miles in length, and from 150 to 250 in breadth. It consists chiefly of large fields, but little cultivated on account of the frequent inroads of the Tartars, and because there is no water carriage. It had the name of *Red Russia*, from the colour of the hair of its inhabitants. Russia, properly so called, comprehends the three palatinates of Leopold or Lemburg, Belsko, and Chelm.

**RED SEA**, or *Arabic gulf*, so much celebrated in sacred history, separates Arabia from Upper Ethiopia and part of Egypt. This sea is 350 leagues in length

and 40 in breadth. As no river falls into it of sufficient force to counteract the influence of the tide, it is more affected by the motions of the great ocean than any of the inland seas nearly in the same latitude. It is not much exposed to tempests: the winds usually blow from north to south, and being periodical, like the monsoons of India, invariably determine the season of sailing into or out of this sea. It is divided into two gulfs; that to the east was called the *Ælantic gulf*, from the city *Ælana* at the north end of it; and that to the west the *Heroopolitic*, from the city of Heroopolis; the former of which belongs to Arabia, and the latter to Egypt.

Mr Bruce has made many observations on this sea, which are worthy of notice.—With regard to the name, he says it was certainly derived from Edom or Esau the son of Jacob; though in another place he says, he wonders that writers have not rather supposed it to have got the epithet of *Red*, from the colour of the sand on its coasts, than for other reasons they have alleged. With regard to any redness of the water itself, or in the bottom, which some have asserted, our traveller assures us that there is no such thing. It is more difficult to assign a reason for the Hebrew name of it, which signifies the *Sea of Weeds*; as he never saw a weed throughout the whole extent of it. “Indeed, (says he) upon the slightest consideration, it will occur to any one, that a narrow gulf, under the immediate influence of the monsoons, blowing from contrary points six months each year, would have too much agitation to produce such vegetables, seldom found but in stagnant waters, and seldom, if ever, found in salt ones. My opinion then is, that it is from the large trees or plants of white coral, spread everywhere over the bottom of the Red sea, perfectly in imitation of plants on land, that the sea has obtained this name.—I saw one of these, which, from a root nearly central, threw out ramifications of an almost circular form, measuring 26 feet every way.”

Our author has also made many useful observations on the navigation of this sea. “All the western shore (he says) is bold, and has more depth of water than the east; but on this side there is neither anchoring ground nor shoals. It is rocky, with a considerable depth of water everywhere; and there are number of funken rocks, which, though not visible, are sufficiently near the surface to destroy a large ship.” The cause of this, in Mr Bruce's opinion, is, that the mountains on the side of Abyssinia and Egypt are all of hard stone, porphyry, many different kinds of marble, granite, alabaster, and basalt. These being all composed of solid materials, therefore, can part with very little dust or sand, which might otherwise be blown from them into the sea. On the opposite coast, viz. that of Hejaz and Tahamah, on the Arabian side, the whole consists of moving sands; a large quantity of which is blown from the south-east by the dry winter monsoons; which being lodged among the rocks on that side, and confined there by the north-east or summer monsoon, which is in a contrary direction, hinders them from coming over to the Egyptian side. Hence the western coast is full of sunk rocks for want of sand to cover them, with which they would otherwise become islands. They are naked and bare all round, with sharp points like spears; while, on the east-side, every rock becomes

*Red Sea.*

*Red Sea.* an island, and every two or three islands become a harbour. On the ends of the principal of these harbours the people have piled up great heaps of stones to serve as signals; "and it is in these (says Mr Bruce) that the large vessels from Cairo to Jidda, equal in size to our large 74 gun-ships (but from the cisterns of mason-work built within for holding water, I suppose double their weight), after navigating their portion of the channel in the day-time, come safely and quietly to at four o'clock in the afternoon; and in these little harbours pass the night, to sail into the channel again next morning."

The western channel of the Red sea was chosen, in the days of the Ptolemies, for the track of the Indian and African. These monarchs erected a great number of cities all along the western coast; and notwithstanding the dangers of the navigation, we do not hear that it was ever abandoned on account of them.

From the observations made by our author on the navigation of the Red sea, he undertakes to point out a safe passage for large ships to the gulf of Suez, so that they may be able to judge of the propriety of their own course themselves, without trusting implicitly to the pilots they meet with, who are often very ignorant of their profession. This sea, according to Mr Bruce, may be divided into four parts, of which the channel occupies two, till near the latitude of 26°, or that of Cossair. On the west it is deep water, with many rocks; and on the east it is full of islands, as has been already mentioned. Between these islands there are channels and harbours of deep water, where ships may be protected in any wind; but a pilot is necessary in sailing among these from Mocha to Suez, and the voyage besides can be continued only during part of the day. Ships bound to Suez without the consent of the sheriff of Mecca, that is, without any intention of selling their cargo at Jidda, or paying custom there, ought to take in their fresh water at Mocha; or if there be any reason against this, a few hours will carry them to Azab or Zaba on the Abyssinian coast, where they may be plentifully supplied: but it must be remembered, "that the people here are *Galla*, the most treacherous and villanous wretches on earth." Here not only water may be procured, but plenty of sheep, goats, with some myrrh, and incense in the proper season.—Great caution, however, must be used in dealing with the people, as even those of Mocha, who are absolutely necessary to them in their commercial dealings, cannot trust them without surety or hostages. Not many years ago, the surgeon and mate of the *Elgin East India* man, with several other sailors, were murdered by these savages as they went ashore to purchase myrrh, though they had a letter of safe conduct from the shekh.

To such as do not want to be known, our author recommends a low black island on the coast of Arabia, named *Camaran*, in latitude 15° 30'. It is distinguished by a white house or fortress on the west end of it; where water is to be had in still greater plenty than at Azab; but no provisions, or such only as are very bad, can be procured. If it is necessary not to be seen at all on the coast, the island of *Foosha* is recommended by our author as having excellent water, with a faint or monk, whose office is to keep the wells clean. This is one of the chain of islands which stretches almost across the gulf from Loheia to Masuah, and from ac-

tual observation by Mr Bruce, is found to be situated *Red Sea.*

to Yambo there is a safe watering place; and there is an absolute necessity for having a pilot before you come to Ras Mahomet; because, over the Ælanitic gulf, the mountains of Aucha, and the Cape itself, there is often a thick haze which lasts for many days together, and a number of ships are lost by mistaking the eastern bay or Ælanitic gulf for the entrance of the gulf of Suez; the former has a ridge of rocks nearly across it. After reaching Sheduan, a large island, about three leagues farther in a north by west direction, there is a bare rock distinguished by no particular name; but so situated that ships ought not to come within three leagues of it. This rock is to be left to the westward at the distance just mentioned; after passing which you meet with shoals forming a pretty broad channel, with soundings from 15 to 20 fathoms; and again, on standing directly for Port Suez, there are two other oval lands with sunk rocks in the channel, between which you are to steer. The first is known at a distance by two hills that rise above the water side; which, in clear weather, may be seen 10 leagues off. Just to the south-east of the second is the town and harbour, where there are some palm trees about the houses, the most remarkable, as being the first that are seen on the coast. The soundings in the bay to Port Suez are clean and regular; "and, by giving the beacon a small birth on the larboard hand, you may haul in a little to the northward, and anchor in five or six fathom." In spring tides, it is high water at Tor nearly about 12 o'clock: in the middle of the gulf there is no perceptible tide, but at the sides it runs at the rate of more than two knots in the hour. Tor itself is but a small village, with a convent of monks belonging to those of Mount Sinai. It was taken by Don John de Castro, and fortified soon after its discovery by the Portuguese; but has never since been a place of any consideration; serving now only for a watering place to the ships trading to or from Suez. From this place there is a distinct view of Mount Horreb and Sinai, which appear above and behind the others, with their tops frequently covered with snow in the winter.

Mr Bruce next proposes to consider some questions which may be asked by persons of curiosity rather than any thing else. One of these is concerning the level of the water of this sea itself, which has been supposed several feet above that of the Mediterranean. "To this (says our author) I answer, that the fact has been supposed to be so by antiquity, and alleged as a reason why Ptolemy's canal was made from the bottom of the Heroopolitic gulf rather than brought due north across the isthmus of Suez; in which last case it was feared it would submerge a great part of Asia Minor. But, who has ever attempted to verify this by experiment? or who is capable of settling the difference of levels, amounting, as supposed, to some feet and inches, between two points 120 miles distant from each other, over a desert that has no settled surface, but is changing its height every day? Besides, since all seas are in fact but one, what is it that hinders the Indian ocean to flow to its level? What is it that keeps the Indian ocean up? Till this last branch of the question is resolved, I shall take it for granted that no such difference

Red Sea  
Reddle.

of level exists, whatever Ptolemy's engineers might have pretended to him; because, to suppose it fact, is to suppose the violation of one very material law of nature."

The next thing considered by our author is the passage of the Israelites through the Red sea. At the place where he supposes the passage to have been, the sea is not quite four leagues broad, so that it might easily have been crossed in one night without any miracle. There is about 14 fathoms water in the channel, and 9 at the sides, with good anchorage everywhere; the farthest side is a low sandy coast, and a very easy landing place. "The draught of the bottom of the gulf (says he) given by Dr Pococke, is very erroneous in every part of it. It was proposed to Mr. Nebeker, who in Egypt, to inquire upon the spot, whether there were not some ridges of rocks where the water was shallow, so that an army at particular times might pass over? Secondly, Whether the Etesian winds, which blow strongly all summer from the north-west, could not blow violently against the sea, to keep it back on the shore, so that the Israelites might have passed without any miracle? And a copy of these queries was left for the use of any ingenious traveller. But I must confess, that the gentlemen who were who proposed these queries, did not think they merited any attention. All the Etesian winds blowing from the north-west in summer, could heap up the sea as a wall on the shore, or to the south, of 50 feet high, and the sea would remain of building the wall on the left hand, or to the north. Besides, water standing in that position for a day, must have lost the nature of a fluid. Where came that cohesion of particles that rendered that wall to escape at the sides? This is as great a miracle as that of Moses. If the Etesian winds had blown this once, they must have repeated it many a time, and since, from the same causes. Yet Dionysius Periegetes says, the Troglodytes, the indigenous inhabitants of that very spot, had a tradition from father to son, from their very earliest and remotest ages, that once this division of the sea did happen there; and that after leaving the bottom some time dry, the sea again came back, and covered it with great fury. The words of this author are in the most remarkable kind. We cannot think this tradition is a fiction, in favour of revelation. He knew not Moses, nor knew a word about Pharaoh and his host; but he knew the effects of the division of the sea in that party, as those of Moses, from the manner of the undesigning pagans."

RED-Shank, in ornithology. See SCOLORAX.

RED-Start, a species of *MEGALOTHA*.

RED-Wing. See TURDUS.

REDANS, in field fortification. See the article REDENS.

REDDENDUM, in law, is used substantively for the clause in a lease wherein the rent is reserved to the lessor. The proper place for it is next after the limitation of estate.

REDDITIO, was the third part of the sacrifice of the heathens, and consisted of the solemn act of putting in again the entrails of the victims, after they had been religiously inspected. See SACRIFICE.

REDDLE, a soft, heavy, red marl, of great use in colouring; and being washed and freed from sand,

is often sold by our druggists under the name of *lofe* Redemp-tion.

REDEMPTION, in law, a faculty or right of re-entering upon lands, &c. that have been sold and assigned, upon reimbursing the purchase-money with legal costs.

REDEMPTION, in theology, denotes the recovery of mankind from sin and death, by the obedience and sacrifice of Christ, who on this account is called the *Redeemer of the world*. See THEOLOGY.

REDENS, or REDANS, or *Redant*, in fortification, a kind of work indented in form of the teeth of a saw, with salient and re-entering angles; to the end that one part may flank or defend another. It is likewise called *saw-work* and *indented work*. The lines or faces in this flank one another.

Redens are used in fortifying walls, where it is not necessary to be at the expence of building bastions; as when they stand on the side of a river running through a garrison town, a marsh, the sea, &c. But the fault of such fortifications is, that the besiegers from one battery may ruin both the sides of the tennaille or front of a place, and make an assault without fear of being enfiladed, since the defences are mined. The parapet of the corridor is likewise often redented or carried on by the way of redens. The redens was used before bastions were invented, and some people think them preferable.

REDI (Francis), an Italian physician and polite scholar, was born at Arezzo in Tuscany in 1626. His ingenuity and learning recommended him to the office of first physician to Ferdinand II. duke of Tuscany; and he contributed not a little toward the compiling of the Dictionary of La Crusca. He wrote upon vipers, upon the generation of insects, and composed a good deal of poetry. All his writings are in Italian; and his language is so fine and pure, that the authors of the Dictionary of La Crusca have often cited them as standards of perfection. He died in 1697.

REDOUBT, in fortification, a small square fort, without any defence but in front; used in trenches, lines of circumvallation, contravallation, and approach; as also for the lodgings of corps-de-gard, and to defend passages.

REDUCTION, in the schools, a manner of bringing a term or proposition, which was before opposite to some other, to be equivalent to it.

REDUCTION, in arithmetic, that rule whereby numbers of different denominations are brought into one denomination. See ARITHMETIC.

REDUCTION of Equations, in algebra, is the clearing them from all superfluous quantities, bringing them to their lowest terms, and separating the known from the unknown, till at length only the unknown quantity is found on one side, and known ones on the other. The reduction of an equation is the last part of the resolution of the problem. See ALGEBRA.

REDUCTION of a figure, design, or draught, is the making a copy thereof, either larger or smaller than the original; still preserving the form and proportion. The great use of the proportional compasses is the reduction of figures, &c. whence they are called *compasses of reduction*. See the article COMPASS.

There are various methods of reducing figures, &c.

**Reduction** the most easy is by means of the pentagraph, or parallelogram; but this hath its defects. See the article **PENTAGRAPH**.

**Redundant** The best and most usual methods of reduction are as follow: 1. To reduce a figure, as ABCDE (N<sup>o</sup> 1.), into a less compass. About the middle of the figure, as  $\pi$ , pitch on a point, and from this point draw lines to its several angles A, B, C, &c. then drawing the line  $ab$  parallel to AB,  $bc$  parallel to BC, &c. you will have the figure  $abcde$  similar to ABCDE.

If the figure  $abcde$  had been required to be enlarged, there needed nothing but to produce the lines from the point beyond the angles, as  $\pi D$ ,  $\pi C$ , &c. and to draw lines, viz. DC, CB, &c. parallel to the sides  $d c$ ,  $c b$ , &c.

2. To reduce a figure by the angle of proportion, suppose the figure ABCDE (N<sup>o</sup> 2.) required to be diminished in the proportion of the line AB to  $a b$  (N<sup>o</sup> 3.), draw the indefinite line GH (N<sup>o</sup> 4.), and from G to H set off the line AB. On G describe the arch HI. Set off the line  $a b$  as a chord on HI, and draw GI. Then with the angle IGH, you have all the measures of the figure to be drawn. Thus to lay down the point  $c$ , take the interval BC, and upon the point G describe the arch KL. Also on the point G describe MN; and upon A, with the distance MN, describe an arch cutting the preceding one in  $c$ , which will determine the side  $bc$ . And after the same manner are the other sides and angles to be described. The same process will also serve to enlarge the figure.

3. To reduce a figure by a scale. Measure all the sides of the figure, as ABCDE (N<sup>o</sup> 2.) by a scale, and lay down the same measures respectively from a smaller scale in the proportion required.

4. To reduce a map, design, or figure, by squares. Divide the original into little squares, and divide a fresh paper of the dimensions required into the same number of squares, which are to be larger or less than the former, as the map is to be enlarged or diminished. This done in every square of the second figure, draw what you find in its correspondent one in the first.

**REDUCTION**, in metallurgy, is the bringing back metalline substances which have been changed into scoriae or ashes, or otherwise divested of their metallic form, into their natural and original state of metals again. See METALLURGY, *passim*; and CHEMISTRY, N<sup>o</sup> 140. and 320.

**REDUCTION**, in surgery, denotes an operation whereby a dislocated, luxated, or fractured bone, is restored to its former state or place.

**REDUNDANCY**, a fault in discourse, consisting in the use of a superfluity of words. Words perfectly synonymous are redundant, and ought to be retrenched.

**REDUNDANT**, in music. What the French call *une accord superflue*, which we have translated a *redundant chord* in the article MUSIC (from D'Alembert), has by others been rendered a *chord extremely sharp*, as in the translation of Rameau's Principles of Composition. Their nature will be best understood by a few examples, and an account of the number of tones, semitones, or lesser intervals, contained in each.

The *second redundant* is composed of a major tone, and a minor semitone; as from *fa* to *sol* sharp. Its proportion is as 64 to 75.

The *third redundant* consists of two tones and a semitone, as *fa*, *la*, sharp. Its proportion is as 96 to 125.

The *fourth redundant* is the same with the tritone. From these examples compared with the same intervals in their natural state, the reader may form a general idea of what is meant by *redundant*.

**REE**, **REIS**, or *Res*, a little Portuguese coin. See **MONEY-Table**.

**REED**, in botany: See **ARUNDO** and **BAMBUS**.

There are two sorts of reeds, says Hasselquist, growing near the Nile. One of them has scarce any branches; but is furnished with numerous leaves, which are narrow, smooth, channelled on the upper surface; and the plant is about 12 feet high. The Egyptians make ropes of the leaves. They lay them in water like hemp, and then make them into good strong cables. These, with the bark of the date tree, form almost the only cable used in the Nile. The other sort is of great consequence. It is a small reed, about two or three feet high, full branched, with short, sharp, lanceolate leaves. The roots, which are as thick as the stem, creep and mat themselves together to a considerable distance. This plant forms a kind of carpet, and is used to it, continues the learned author, is the most fertile in Egypt owing: for the matted roots have raised the earth which floated in the waters, and thus formed part of the sea, a country that is habitable.

**Fire-REEDS**. See **Fire-Ship**.

**REED**, a term in the west of England for the straw used by thatchers, which is wheat straw finely combed, consisting of stiff, unbruised, and unbroken stalks of great length, carefully separated from the straw used for fodder by the thrasher, and bound in sheaves or bunches, each of which weighs 28 lb. and are sold from 21s. to 31s. per hundred bunches, according to the season. This is a great improvement in the art of thatching, as it gives a finish to the work, which cannot be attained by straw, rough and tumbled together, without any separation of the long and short; it also is a readier mode of working.

**REEF**, a term in navigation. When there is a great gale of wind, they commonly roll up part of the sail below, that by this means it may become the narrower, and not so much blown by the wind, which contracting or taking up the sail they call a *reef*, or *reefing the sail*: so also when a vessel is sprung, as they call it, that is, when it is cracked, or almost broken in the cap, they cut off the lower part that was near broken off, and setting the other part, which is much shorter, in the step again, they call it a *reefing the mast*.

**REEL**, in the manufactures, a machine serving for the office of reeling. There are various kinds of reels; some very simple, others very complex.

**REELING**, in the manufactures, the winding of silk, cotton, or the like, into a skein, or upon a button, to prevent its entangling. It is also used for the charging or discharging of bobbins, or quills, to use them in the manufacture of different stuffs, as thread, silk, cotton, &c. Reeling is performed in different ways, and on different engines.

**REEVING**, in the sea-language, the putting a rope through a block: hence to pull a rope out of a block is called *unreeving*.

**RE-EXCHANGE**, in commerce, a second payment of the price of exchange, or rather the price of

**Ree**  
**Re-Exchange**

**Reflection** essay being only a very accurate refining, we refer to the article *Essay of the Value of Silver*.

**Reform.**

Large quantities of silver are thus purified, after the operations by which that metal is obtained from its ores. This silver, being always much allayed, is to be mixed with a sufficient quantity of lead to complete its purification, unless lead has been added in its first fusion from the ore, or unless it has been extracted from an ore which also contains lead; in which latter case, it is allayed naturally with a sufficient quantity, or more than sufficient, for the refining of it.

**REFLECTION**, the return or progressive motion of a moving body, occasioned by some obstacle which hindered it from pursuing its former direction.

**Circular Instrument of REFLECTION**, an instrument for measuring angles to a very great degree of accuracy. It was invented by the celebrated astronomer Mr Tobias Mayer of Gottingen, principally with a view to do away the errors of the divisions of the limb; and has since been much improved by the chevalier de Borda, and M. J. H. de Magellan. This instrument is particularly applicable to the measuring of the distances of the heavenly bodies, and was used by the French in their part of the operation for determining the difference of meridians of Paris and Greenwich. For the description, rectification, and use of this instrument, see the article **NAVIGATION**, and *Mackay on the Longitude*, Vol. I. p. 44.

**REFLECTION of the Rays of Light**, in catoptrics, is their return, after approaching so near the surface of bodies as to be thereby repelled or driven backwards. For the causes of reflection, see **OPTICS**, *Index at Rays of Light*, and *Reflection of Light*, &c. For the application of the doctrine of reflection to mirrors, see **OPTICS**, p. 347—349. See also **MIRROR**, **BURNING-GLASS**, and **GLASS-GRINDING**; and for the cutting or polishing of mirrors, see the article **POLISHING of Looking-glasses**, &c. See also **TELESCOPE**.

**REFLECTION** is also used, figuratively, for an operation of the mind, whereby it turns its view backwards as it were upon itself, and makes itself and its own operations the object of its disquisition; and by contemplating the manner, order, and laws, which it observes in perceiving ideas, comparing them together, reasoning, &c. it frames new ideas of the relations discovered therein. See **METAPHYSICS**.

**REFLEX**, in painting, means those places in a picture which are supposed to be illuminated by light reflected from some other body in the same piece. See **PAINTING**, Part I. sect. 2. and 5.

**REFLUX**, the backward course of water, has the same meaning as the ebbing of the sea, and is opposed to flood, flux, or the flowing of the sea. See **TIDES**.

**REFORM** means a change from worse to better, a re-establishment or revival of former neglected discipline, or a correction of abuses therein. The term is much used in a monastic sense for the reducing an order or congregation of religious to the ancient severity of the rule from which it had gradually swerved, or even for improving on the ancient rule and institution itself, and voluntarily making it more severe. In this sense the order of St Bernard is said to be only a reform of that of St Benedict. In this country it is applied both to politics and religion, and may innocently be applied to any endeavours to change an establishment from worse

to better. But it appears at present to have been chiefly made a pretence for desigas which could not fairly or safely be avowed.

**Reform.**

A reform in religion and in parliament (see **PARLIAMENT**) has, we know, been most loudly called for by men whose religious notions are immensely different from what has been generally reckoned Christianity, and whose designs, as has been legally proved, went to the overthrow of all civil order. For insidious purposes like these, the word reform is a good cloak, especially if any thing can be fixed upon, either in the religion or government of the state, which, with the help of exaggeration and distortion, can be represented to the weak and unthinking as extremely defective and erroneous.

The general error of these men seems to be, that having picked up a set of speculative notions which flatter their own pride and the pride of those who listen to them, they will allow nothing to the arguments of their opponents or the experience of mankind. They think so often and so much upon their ideal reforms, that while they imagine their notions are liberal and extensive, they become contracted beyond measure; and their judgments, of course, are warped by the most inveterate prejudices (see **PARTISANSHIP**). They seldom, perhaps never, reflect, that they are engaged in speculation or in theory which cannot possibly be introduced to practice. They will not take the trouble to do so, and allow it to profit by the wisdom and experience of ages; but they will reform according to those ideas of right which they have learned from their own speculations and airy theories; seldom considering what may be done, they are determined to do what they think ought to be done. Liberty of conscience, and liberty of action, have been claimed by them as the unalienable rights of man; and so we ourselves are disposed to think them; nor have we heard that in this country they have been denied to any man, or set of men, so far as has been thought consistent with the safety of the state, and that of the other individuals who compose it. At the same time, the very same men hesitate not to blame, with acrimony the most violent, and as the utmost of their power to restrain, the actions and opinions of those who with equal conviction, often on better grounds, and generally with more modesty, differ from them.

Amidst that dissension, too, with which they propagate their opinions, they forget the extreme danger on withdrawing the attention of that part of the community, who must earn their bread by the sweat of their brow, from their proper occupations, to the tempestuous sea of political debate, for which their education and mode of life cannot possibly have qualified them. It requires but very little penetration, however, to be able to see, that it can be of no real service either to the individuals themselves, or to the community at large, in whatever light we look upon it. Indeed, to make those the judges of the law, and the reformers of the legislature, who have all their lives been employed in manual labour, is the extreme of folly; and yet it is what some men of considerable abilities, and from whom we had reason to expect better things, have more than once attempted. The effect of such a mode of seduction (and it deserves no better name), when it shall become general, instead of serving the purposes of a real reform, must be to annihilate all civil order. Dissatisfaction

Reform,  
Reforma-  
tion.

tisfaction is the most powerful check to honest industry; and dissatisfaction and idleness must be the effect of the wanderings of such men in the labyrinth of politics; which, for uncultivated minds especially, paves the way for every species of vice, and gradually ripens them for any wickedness, however atrocious. For the truth of these remarks, we appeal to the history of mankind from the creation to the present time: and we would seriously request the *sober friends of reform*, and many such, we doubt not, there are; to reflect, that in the present day we have more to fear from licentiousness than from despotism; from reform carried to an extreme than from the pretended attempts either of kings or ministers to annihilate our liberty (see *Revolution*.)

It may also be worth their while to consider, that times of public danger are not generally the best adapted to attempts, changes of government; because what might satisfy one party would probably be thought too little by another, and divisions at such a period are most dangerous. When, therefore, attempts are made for reform, care should be taken to be consistent with the safety of the state, and to avoid the heated, which may by speculation be thought of, but unnecessary, but of such a nature as to excite the passions. These remarks are particularly submitted to by the *Reformers*, who in more peaceable times have thought of nor al-

ways, and they may speak as much as they please, but they cannot change the minds of men, and of reforming the system by the dictates of a refined and disinterested philosophy; but when they come to apply these principles to practice, they will either find their reasonings little better than empty sounds, and therefore, as is more generally found to be the case, the schemes which in theory appeared to be the most perfect, when combined with the malignant and insatiable passions of men, lead to ruin and destruction. The first institution of government, except among the Jews, was unquestionably the effect of passion and interest combined; and this passion and this interest, restrained within due bounds, is productive of much happiness. That government, we believe, too, will be best supported, and most productive of happiness, in which the mutual passions and interests of the individuals who compose it are so equally poised as to support one another, and to promote each the ends and success of the other: and this by the ablest reasoners and the best men has been thought to be the case with the British constitution. If the modern favourers of reform should think this an unstable support, if they will consider the world as it ever has been, and as it is, they will find it the only one we have, except religion; and they will thence be inclined to make the best of it. If, after all, however, they should be disposed to doubt the position, we have only further to request them, with the sincerity of men and of Christians, to consult their own breasts, and seriously to consider the probable motives of those who act with them. They will then perhaps see, and they surely ought to acknowledge, that few men have acted more according to the impulse of passion, interest, and ambition, than those who have for some time past founded the tocsin of reform.

REFORMATION, in general, an act of reforming or correcting an error, or abuse in religion, disci-

pline, or the like. By way of eminence the word is used for that great alteration and reformation in the corrupted system of Christianity, begun by Luther in the year 1517.

Under the article *HISTORY* (sect. ii.), the various corruptions in religion, the oppressions and usurpations of the clergy, and the extreme insolence of the popes, have been so fully treated of, that any further detail here is unnecessary. It is sufficient to observe, that, before the period of the Reformation, the pope had in the most audacious manner declared himself the sovereign of the whole world. All the parts of it which were inhabited by those who were not Christians, he accounted to be inhabited by *nobody*; and if Christians took it into their heads to possess any of those countries, he gave them full liberty to make war upon the inhabitants without any provocation, and to treat them with no more humanity than they would have treated wild beasts. The countries, if conquered, were to be parcelled out according to the pope's pleasure; and dreadful was the situation of that prince who refused to obey the will of the holy pontiff, of which many instances will occur to the reader in the various historical articles of this work. In consequence of this extraordinary authority which the pope had assumed, he at last granted to the king of Portugal all the countries to the eastward of Cape Non in Africa, and to the king of Spain all the countries to the westward of it. In this, according to the opinions of some, was completed in his person the character of *Antichrist sitting in the temple of God, and showing himself as God* \*. He had long before, say they, assumed the supremacy belonging to the Deity himself in spiritual matters; and now he assumed the same supremacy in worldly matters also, giving the extreme regions of the earth to whom he pleased. The Reformation, therefore, they consider as the immediate effect of divine power taking vengeance on this and all other deviations from the system of truth; while others consider it merely as an effect of natural causes, and which might have been foreseen and prevented, without abridging the papal power in any considerable degree.

Be this as it will, however, the above-mentioned partition was the last piece of insolence which the pope ever had, or in all probability ever will have in his power to exercise, in the way of parcelling out the globe to his adherents. Every thing was quiet, every heretic exterminated, and the whole Christian world supinely acquiesced in the enormous absurdities which were inculcated upon them; when, in 1517, the empire of superstition began to decline, and has continued to do so ever since. The person who made the first attack on the extravagant superstitions then prevailing was Martin Luther; the occasion of which is fully related under the article *LUTHER*. By some it is pretended, that the only motive which Luther had in beginning the Reformation was his enmity to the Dominican friars, who had excluded his order (the Augustines) from all share in the gainful traffic of indulgences. But this does not seem at all probable, if we consider that such a motive would not naturally have led him to deny the virtue of indulgences, as such conduct could not but exclude him for ever from any chance of a share in the traffic, which otherwise perhaps he might have obtained. Besides, the extreme contrariety of this traffic to the common principles of reason and honesty was so great, that we

cannot wonder at finding *one* man in the world who had sense enough to discern it, and virtue enough to oppose such an infamous practice. In all probability, however, the insignificance of the first reformer was the reason why he was not persecuted and exterminated at his first beginning, as others had been before him. Another reason probably might be, that he did not at once attack the whole errors of Popery, but brought about his reformation gradually, probably as it occurred to himself, and as we have related in the account of his life.

3  
In Switzer-  
land by  
Zuinglius.

The Reformation began in the city of *Wittenberg* in Saxony, but was not long confined either to that city or province. In 1520 the Franciscan friars, who had the care of promulgating indulgences in Switzer-land, were opposed by Zuinglius, a man not inferior in understanding and knowledge to Luther himself. He proceeded with the greatest vigour, even at the very beginning, to overturn the whole fabric of Popery; but his opinions were declared erroneous by the universities of Cologne and Louvain. Notwithstanding this, the magistrates of Zurich approved of his proceedings; and that whole canton, together with those of Bern, Basil, and Schaffhausen, embraced his opinions.

In Germany, Luther continued to make great advances, without being in the least intimidated by the ecclesiastical censures which were thundered against him from all quarters, he being continually protected by the German princes either from religious or political motives, so that his adversaries could not accomplish his destruction as they had done that of others. The princes, who were upon bad terms with the court of Rome, took advantage of the success of the new doctrines; and in their own dominions easily overturned a church which had lost all the respect and veneration of the inferior ranks. The court of Rome had disobliterated some of the smaller princes in the north of Germany, whom the pope probably thought too insignificant to be worth the managing, and they universally established the Reformation in their own dominions. Melancthon, Carlostadius, and other men of eminence, also greatly forwarded the work of Luther; and in all probability the Popish hierarchy would have soon come to an end, in the northern parts of Europe at least, had not the emperor Charles V. given a severe check to the progress of reformation in Germany.

4  
Opposed in  
Germany  
by Char. V.

In order to follow out the schemes dictated by his ambition, he thought it necessary to ingratiate himself with the pope; and the most effectual method of doing this was by destroying Luther. The pope's legates insisted that Luther ought to be condemned by the diet of Worms without either trial or hearing; as being a most notorious, avowed, and incorrigible heretic. However, this appeared unjust to the members of the diet, and he was summoned to appear; which he accordingly did without hesitation. There is not the least doubt that his appearance there had been his last in this world, had not the astonishing respect that was paid him, and the crowds who came daily to see him, deterred his judges from delivering the church from the author of such a pestilent heresy; which they were strongly solicited by the pope's party to do. He was therefore permitted to depart with a safe-conduct for a certain time; after which he was in the state of a proscribed criminal, to whom it was unlawful to perform any of the offices of humanity.

During the confinement of Luther in a castle near

Waburg, the Reformation advanced rapidly: almost every city in Saxony embracing the Lutheran opinions. At this time an alteration in the established forms of worship was first ventured upon at Wittenberg, by abolishing the celebration of private masses, and by giving the cup as well as the bread to the laity in the Lord's sup-<sup>5</sup>per. In a short time, however, the new opinions were condemned by the university of Paris, and a refutation of them was attempted by Henry VIII. of England. But Luther was not to be thus intimidated. He published his animadversions on both with as much acrimony as if he had been refuting the meanest adversary; and a controversy managed by such illustrious antagonists drew a general attention, and the reformers daily gained new converts both in France and England.

berg.

6  
But while the efforts of Luther were thus everywhere crowned with success, the divisions began to prevail among the churches. The first dispute was between Luther and Zuinglius concerning the manner in which the body and blood of Christ were present in the eucharist. Luther and his followers, though they had rejected the doctrine of transubstantiation, were nevertheless of opinion that the body and blood of Christ were really present in the Lord's supper, in a way which they were unable to explain. Carlostadius, who was a more liberal thinker, first suggested another view of the matter, which was afterwards confirmed by Melancthon, and others, namely, that the body and blood of Christ were really present in the eucharist, but not in the same manner as wine were no more than external signs of the remembrance of Christ's sufferings in the sacrament who received it. Both parties maintained their ground with the utmost obstinacy; and, by their mutual animosity, gave their adversaries an argument against them, namely, to this day the Catholics urge with great reason, that the Protestants are so divided, that it is impossible to know who is right or wrong; and that this cannot be a stronger proof than these divisions, that the whole doctrine is false.

To these intestine divisions was added the danger of a civil war, occasioned by opposition on the one hand, and enthusiasm on the other. In 1525, a great number of seditionaries arose on a sudden in different parts of Germany, and united their forces, and made war against the emperor, laying waste the country with fire and sword, and committing everywhere the greatest cruelties. The greatest part of this furious mob was composed of peasants and vassals, who groaned under heavy burdens, and declared that they were no longer able to bear the despotic government of their chiefs; and hence this sedition had the name of *the rustic war*, or the *war of the peasants*. At first this rabble declared, that they had no other motives than the redress of their grievances; but no sooner had the enthusiast Munzer, or Munster, the anabaptist, put himself at their head, than the face of things was entirely changed, and the civil commotions in Saxony and Thuringia exceedingly increased, of which an account is given under the article ANABAPTISTS.

In the mean time Frederic, surnamed the *Wise*, elector of Saxony, and Luther's great patron, departed this life, and was succeeded by his brother John. Frederic, though he had protected and encouraged Luther, yet was at no pains to introduce the reformed religion into his

tion.Reforma-  
tion estab-  
lished in  
Saxony.

his dominions. But with his successor it was otherwise; for he, convinced that Luther's doctrine must soon be totally destroyed and suppressed unless it received a speedy and effectual support, ordered Luther and Melancthon to draw up a body of laws relating to the form of ecclesiastical government, the method of public worship, &c. which was to be proclaimed by heralds throughout his dominions. This example was followed by all the princes and states of Germany who renounced the papal supremacy; and a like form of worship, discipline, and government, was thus introduced into all the churches which dissent from that of Rome. This open renunciation of the Romish jurisdiction, then changed the face of affairs; and the patrons of Popery soon intimated, in a manner not at all ambiguous, that they intended to make war on the Lutheran party; which would certainly have been put in execution, had not the troubles that took place in France diverted their attention. On the other hand, the Lutherans, apprised of the hostile intentions, began also to deliberate on the means of defence against that superstition, which was now in danger of being

Revolutions  
at the diet  
of Spire fa-  
vourable to  
the Reformation.

Revolutions at the diet of Spire, in 1526, were favourable to the Reformation. The emperor's ambassadors were ordered to suppress all heresies, and to enforce the rigorous decrees pronounced at Worms. The dissenting princes opposed this motion, declaring that they would not renounce their consciences, nor come to any decision on the doctrines by which it had been established. The whole matter was submitted to a council lawfully assembled; alleging that the emperor's ambassadors of this nature were not to be obeyed. This opinion, after some warm debates, was adopted by a majority of voices, and at length consented to by the emperor. It was unanimously agreed to prohibit the emperor, entreating him to assemble a free and general council; and at the same time it was also agreed, that the emperor should appoint commissioners to settle ecclesiastical affairs in the empire, and to give to God and his people a proper account of their administration, when it should be required of them.

These resolutions proved extremely favourable to the cause of reformation; and had the emperor any leisure for some time to give disputation to the contest. The war, which at this time ensued between him and the pope, gave the greatest advantage to the friends of the reformed, and considerably augmented their number. Several princes, whom the fear of persecution and punishment had hitherto prevented from lending their assistance, publicly renounced the Romish superstition, and introduced among their subjects the same forms of religious worship, and the same system of doctrine, that had been received in Saxony. Others, though placed in such circumstances as discouraged them from acting in an open manner against the interests of the Roman pontiff, were, however, far from discovering the smallest opposition to those who withdrew the people from his despotic yoke; nor did they molest the private assemblies of those who had separated themselves from the

church of Rome. And in general, all the Germans who, before these resolutions of the diet of Spire, had rejected the papal discipline and doctrine, were now, in consequence of the liberty they enjoyed, wholly employed in bringing their schemes and plans to a certain degree of confidence, and in adding vigour and firmness to the cause in which they were engaged. But this tranquillity and liberty was of no long duration. In 1549, a new diet was assembled at the same place by the emperor, after he had quieted the troubles in various parts of his dominions, and concluded a peace with the pope. The power which had been granted to princes of managing ecclesiastical affairs till the meeting of a general council, was now revoked by a majority of votes; and every change declared unlawful that should be introduced into the doctrine, discipline, or worship of the established religion, before the determination of the approaching council was known. This decree was considered as iniquitous and intolerable by the elector of Saxony, the landgrave of Hesse, and other members of the diet, who were persuaded of the necessity of a reformation. The promise of speedily assembling a general council, they looked upon to be an artifice of the church of Rome; well knowing, that a free and lawful council would be the last thing to which the pope would consent. When, therefore, they found that all their arguments and remonstrances made no impressions upon Ferdinand the emperor's brother, who presided in the diet, Charles himself being then at Barcelona, they entered a solemn protest against this decree on the 15th of April, and appealed to the emperor and a future council. Hence arose the denomination of *Protestants*, which from this period has been given to those who separate from the communion of the church of Rome. The princes of the empire who entered this protest were, John elector of Saxony; George elector of Brandenburg; Ernest and Francis dukes of Lunenburg; the landgrave of Hesse; and the prince of Anhalt. These were seconded by 13 imperial towns, viz. Strasburg, Ulm, Nuremberg, Constance, Rottingen, Windheim, Memmingen, Nortlingen, Lindaw, Kempton, Heilbron, Wismberg, and St Gall.

The dissenting princes, who were the protectors and heads of the reformed churches, had no sooner entered their protest, than they sent proper persons to the emperor, who was then upon his passage from Spain to Italy, to acquaint him with their proceedings in this matter. The ministers employed in this commission executed it with the greatest intrepidity and presence of mind; but the emperor, exasperated at the audacity of those who presumed to differ from him, caused the ambassadors to be arrested. The news of this violent step made, the Protestant princes conclude, that their personal safety, and the success of their cause, depended entirely upon their own courage and union. They determined, therefore, to enter into a solemn confederacy: for which purpose they held several meetings at Rot, Nuremberg, Smalcald, and other places; but so different were their opinions and views, that they could determine upon nothing.

One great obstacle to the intended confederacy was the dispute which had arisen between Luther and Zuinglius concerning the real presence of Christ in the Lord's supper. To determine this dispute, if possible, Philip, landgrave of Hesse, invited, in the year 1549, to

tion.

a conference at Marburg, Luther and Zuinglius, together with several other of the more eminent doctors who adhered to the respective parties of these contending chiefs: but this measure was not attended with the salutary effects which were expected from it. The divines disputed for four days in presence of the landgrave. Luther attacked Oecolampadius, and Zuinglius was attacked by Melancthon. Zuinglius was accused of heresy, not only on account of his explanation of the nature and design of the Lord's supper, but also in consequence of the false notions he was supposed to have adopted concerning the divinity of Christ, the efficacy of the divine word, original sin, and some other parts of the Christian doctrine. This illustrious reformer, however, cleared himself from the greatest part of these charges with the most triumphant evidence, and in such a manner as appeared satisfactory even to Luther himself: but their dissension concerning the manner of Christ's presence in the eucharist still remained; nor could either of the contending parties be persuaded to abandon, or even to modify, their opinions on that matter. The only advantage, therefore, which resulted from the meeting was, that the jarring doctors formed a kind of truce, by agreeing to a mutual toleration of their sentiments, and leaving to the disposal of Providence the cure of their divisions.

In the mean time news were received that the emperor designed to come into Germany, with a view to terminate all religious differences at the approaching diet of Augsburg. Having foreseen some of the consequences of those disputes, and, besides, taken the advice of men of wisdom, sagacity, and experience, he became at certain times more cool in his proceedings, and more impartial in his opinions both of the contending parties and the merits of the cause. He, therefore, in an interview with the pope at Bologna, insisted, in the most serious and urgent manner, on the necessity of a general council. His remonstrances and expostulations, however, could not move the pontiff: who maintained with zeal the papal prerogatives, reproached the emperor with an ill-judged clemency, and alleged that it was the duty of that prince to support the church, and to execute speedy vengeance upon that obstinate heretical faction who dared to call in question the authority of Rome and its pontiff. To this discourse the emperor paid no regard, looking upon it as a most iniquitous thing, and a measure directly opposite to the laws of the empire, to condemn unheard a set of men who had always approved themselves good citizens, and deserved well of their country in several respects. Hitherto indeed it was not easy for the emperor to form a clear idea of the matters in debate, since there was no regular system as yet composed, by which it might be known with certainty what were the true causes of Luther's opposition to the pope. The elector of Saxony, therefore, ordered Luther, and other eminent divines, to commit to writing the chief articles of their religious system, and the principal points in which they differed from the church of Rome. Luther, in compliance with this order, delivered to the elector at Torgau 17 articles which had been agreed upon in a conference at Sultzbach in 1529; from whence these received the name of the articles of Torgau. But though these were deemed by Luther a sufficient declaration of the sentiments of the reformers, yet it was judged proper to en-

large them, in order to give perspicuity to their arguments, and strength to their cause. In this work Melancthon was employed; in which he showed a proper deference to the counsels of Luther, and expressed his sentiments and doctrine with the greatest elegance and perspicuity; and thus came forth to view the famous *Confession of Augsburg*.

On the 15th of June 1530, Charles arrived at Augsburg, and the diet was opened five days after. The Protestants received a formal permission to present an account of their tenets to the diet on the 25th of the same month; in consequence of which, at the time appointed, Christian Beyer, chancellor of Saxony, read, in the German language, before the emperor and the princes assembled, the confession of Augsburg above-mentioned. It contains 28 chapters, of which 21 were employed in representing the religious opinions of the Protestants, and the other seven in pointing out the errors and imperfections of the church of Rome. The princes heard it with the deepest attention and collection of mind: it confirmed some, and corrected others who had embraced; surprised others, and converted others. Before this time had little or no idea of the sentiments of Luther, were now convinced of their innocence, but delighted in his doctrine, and simplicity. The topics of his doctrine, which it is pre- being read were distributed to the princes, and collected to by John elector of Saxony, George duke of Mecklenburg, Ernest duke of Brunswick, and Wolfgang prince of Hesse, Wolfgang prince of Anhalt, and the imperial cities of Nuremberg and Regensburg.

The creatures of the pope, however, were not so content at this diet employed John Beyer, chancellor of Saxony, together with Eckius, and another named Cockleus, to draw up a refutation of the Protestant confession: which refutation, when it was read, the emperor required the Protestants to acquiesce in it, and put an end to the religious disputes by an unlimited submission to the opinions and decrees contained in this answer. But this demand was the more being complied with. The Protestants declared, on the contrary, that they were by no means satisfied with the reply of their adversaries, and expressly declared a copy of it, that they might more fully demonstrate its errors, insufficiency, and impotence. But this reasonable request was refused by the emperor, who interposed his supreme authority to prevent any further proceedings in this matter, and solemnly prohibited the publication of any new writings or declarations that might contribute to lengthen out these religious debates. This, however, did not reduce the Protestants to silence. The divines of that communion, who had been present at the diet, endeavoured to recollect the arguments and objections employed by Beyer, and had again recourse to the pen of Melancthon, who refuted them in an ample and satisfactory manner in a piece which was presented to the emperor on the 22d of September, but which Charles refused to receive. This answer was afterwards enlarged by Melancthon, when he had obtained a copy of Beyer's reply; and was published in the year 1531, with the other pieces that related to the doctrine and discipline of the Lutheran church, under the title of *A defence of the Confession of Augsburg*.

Matters now began to draw towards a crisis. There were only three ways of bringing to a conclusion these religious

sion of  
Augsburg.

## Reformation.

religious differences. 1. To grant the Protestants a toleration and privilege of serving God as they thought proper: 2. To compel them to return to the church of Rome by the violent methods of persecution: or, 3. That a reconciliation should be made, upon fair, candid, and equitable terms, by engaging each of the parties to temper their zeal with moderation, to abate reciprocally the rigour of their pretensions, and remit something of their respective claims. The third expedient was most generally approved of, being peculiarly agreeable to all who had at heart the welfare of the empire; nor did the pope seem to look upon it either with aversion or contempt. Various conferences therefore were held between persons eminent for piety and learning on both sides; and nothing was wanted but might have the least tendency to calm the animosities and heal the divisions which agitated between the contending parties. But the differences were too great to admit of a reconciliation; and therefore the varieties of

16  
Severe de-  
cease against  
the Proto-  
stants.

Rome, and in reply to the arguments of imperial agents, and even of the secular arm. On the 15th of April, 1522, a decree was issued out by the emperor, which was intended during the absence of the pope, to be read by those who were the chief of the empire (electors), in which every thing was ordered, which the friends of religious liberty, and of the emperor's dubious promise of reformation, could desire in a general council about the reformation of the diet. In this decree, the abuses of the Popish religion were pointed out, and a new degree of severity was expressed, which had been published at the diet of Worms, and his adherents, the changes proposed were introduced into the doctrine and discipline of the church, abuses were severely censured, and the emperor was addressed to the princes, cities, and knights, who were sworn off the Papal yoke, to remain faithful to him, on pain of incurring his indignation and vengeance of the emperor as the protector and guardian of the church. Of this formidable decree the elector of Saxony and confederated princes were informed, that they assembled at Schmalkden, to deliberate on the measures proper to be taken to resist it, and in the years 1530 and 1535 they met, first at Smalcald, and afterwards at Frankfort, where they made a solemn alliance and confederacy, with the intention of defending vigorously their religion and liberties against the danger and encroachments with which they were threatened by the edicts of Augsbure, without attempting, however, any thing offensive against the votaries of Rome; and into this confederacy they invited the kings of England, France, Denmark, &c.: leaving no means unemployed, that might corroborate and cement this important alliance:

**The life  
of Grant-  
gold.**

This confederacy was at first opposed by Luther, from an apprehension of the calamities and troubles which it might produce; but at last, perceiving the necessity of it, he consented; though he uncharitably, as well as imprudently, refused to comprehend in it, the followers of Zuinglius among the Swiss, together with the German states and cities who had adopted the sentiments and confession of Bucer. In the invitation addressed to Henry VIII. of England, whom the confederate princes were willing to declare the head and protector of their league, the following things, among

others, were expressly stipulated : That the king should encourage, promote, and maintain, the true doctrine of Christ as it was contained in the confession of Augsburg, and defend the same at the next general council : that he should not agree to any council summoned by the bishop of Rome, but protest against it ; and neither submit to its decrees, nor suffer them to be respected in his dominions ; that he should never allow the Roman pontiff to have any pre-eminence or jurisdiction in his dominions ; that he should advance 100,000 crowns for the use of the confederacy, and double that sum if it became necessary : all which articles the confederate princes were equally obliged to observe on their part. To these demands the king replied, that he would maintain and promote the true doctrine of Christ ; but, at the same time, as the true ground of that doctrine lay only in the holy Scriptures, he would not accept at any one's hand what should be his own faith, or that of his kingdom ; and therefore desired that they would send over two learned men to confer with him, in order to promote a religious union between him and the confederates. However, he declared himself of their opinion with regard to the meeting of a free general council, and promised to join with them in all such councils for the defence of the true doctrine ; but thought the regulation of the ceremonial part of religion, being a matter of indifference, ought to be left to the choice of each sovereign for his own dominions. After this the king gave them a second answer more full and satisfactory ; but after the execution of Queen Anne, this negotiation came to nothing. On the one hand, the king grew cold when he perceived that the confederates were no longer of use to him in supporting the validity of his marriage ; and, on the other hand, the German princes became sensible that they could never succeed with Henry unless they allowed him an absolute dictatorship in matters of religion.

While every thing thus tended to an open war between the two opposite parties, the elector Palatine, and the elector of Mentz, offered their mediation, and endeavoured to procure a reconciliation. The emperor himself, for various reasons, was at this time inclined to peace: for, on the one hand, he stood in need of succours against the Turks, which the Protestant princes refused to grant as long as the edicts of Worms and Augsbург remained in force; and, on the other, the election of his brother Ferdinand to the dignity of king of the Romans, which had been carried by a majority of votes at the diet of Cologne in 1531, was by the same princes contested, as being contrary to the fundamental laws of the empire. In consequence of all this, after many negotiations and projects of reconciliation, a treaty of peace was concluded at Nuremberg in 1532, between the emperor and the Protestant princes, on the following conditions; viz. That the latter should furnish a subsidy for carrying on the war against the Turks, and acknowledge Ferdinand lawful king of the Romans; and, that the emperor on his part should abrogate and annul the edicts of Worms and Augsbург, and allow the Lutherans the free and undisturbed exercise of their religious doctrine and discipline, until a rule of faith was fixed either in the free general council that was to be assembled in the space of six months, or in a diet of the empire.

**Refutation.**

tion.

died John elector of Saxony, who was succeeded by his son John Frederic, a prince of invincible fortitude and magnanimity, but whose reign was little better than one continued train of disappointments and calamities. The religious truce, however, gave new vigour to the reformation. Those who had hitherto been only secret enemies to the Roman pontiff, now publicly threw off his yoke; and various cities and provinces of Germany enlisted themselves under the religious standards of Luther. On the other hand, as the emperor had now no other hope of terminating the religious disputes but by the meeting of a general council, he repeated his requests to the pope for that purpose. The pontiff (Clement VII.), whom the history of past councils filled with the greatest uneasiness, endeavoured to retard what he could not with decency refuse. At last, in 1533, he made a proposal by his legate to assemble a council at Mantua, Placentia, or Bologna; but the Protestants refused their consent to the nomination of an Italian council, and insisted on the controversy which had its rise in the heart of Germany, should be determined within the limits of the empire. The pope, by his usual artifices, eluded the performance of his own promise; and, in 1534, was cut off by death, in the midst of his stratagems. His successor Paul III. seemed to show less reluctance to the assembling a general council, and in the year 1535 expressed his inclination to convoke one at Mantua; and, the year following, actually sent circular letters for that purpose through all the states and kingdoms under his jurisdiction. This council was summoned by a bull issued out on the 2d of June 1536, to meet at Mantua the following year; but several obstacles prevented its meeting; one of the most material of which was, that Frederic duke of Mantua had no inclination to receive at once so many guests, some of them very turbulent, into the place of his residence. On the other hand, the Protestants were firmly persuaded that, as the council was assembled in Italy, and by the authority of the pope alone, the latter must have had an undue influence in that assembly; of consequence, that all things must have been carried by the votaries of Rome. For this reason they assembled at Smalcald in the year 1537, where they solemnly protested against this partial and corrupt council, and, at the same time, had a new summary of their doctrine drawn up by Luther, in order to present it to the assembled bishops if it should be required of them. This summary, which had the title of *The Articles of Smalcald*, is commonly joined with the creeds and confessions of the Lutheran church.

21  
Protesta-  
tion against  
it.22  
Fruitless  
schemes of  
accommo-  
dation.

After the meeting of the general council in Mantua was thus prevented, many schemes of accommodation were proposed both by the emperor and the Protestants; but, by the artifices of the church of Rome, all of them came to nothing. In 1541, the emperor appointed a conference at Worms on the subject of religion, between persons of piety and learning chosen from the contending parties. This conference, however, was, for certain reasons, removed to the diet which was to be held at Ratisbon that same year, and in which the principal subject of deliberation was a memorial presented by a person unknown, containing a project of peace. But the conference produced no other effect than a mutual agreement of the contending parties to refer their matters to a general council, or, if

the meeting of such a council should be prevented, to the next German diet.

Reforma-  
tion.

This resolution was rendered ineffectual by a variety of incidents, which widened the breach, and put off to a farther day the deliberations which were designed to heal it. The pope ordered his legate to declare to the diet of Spire, assembled in 1542, that he would, according to the promise he had already made, assemble a general council, and that Trent should be the place of its meeting, if the diet had an objection to that city. Ferdinand, and the princes who adhered to the cause of the pope, gave their consent to this proposal; but it was vehemently objected to by the Protestants, both because the council was summoned by the authority of the pope only, and also because the place was within the jurisdiction of the pope; whereas they desired a free council, which should not be hindered by the distance, nor awed by the proximity of the pontiff. But this protestation produced no effect. Paul III. persisted in his purpose, and issued out his circular letters for the assembling of the council, with the approbation of the emperor. It was justice to this pontiff, however, to be observed, that he showed himself not without liberality in his reformation. He appointed several persons eminent for their piety and learning, for the reformation of the church, and the church of Rome is justly to be commended for the plan proposed in this plan was indeed, as it was said, partial; yet it contained some good things, which scarcely have been exposed by the Protestants. They complained of the great number of bishops, and proposed that some should be retained, but learned and pious men, and that others should be taken to have propagated the corruption of youth. They endeavoured to transfer the benefice to another, grants of benefices, and pluralities. They proposed that the number of monks should be abolished; that the liberty of the press should be restrained and limited; that the Colleges of the Jesuits should be suppressed; that no ecclesiastic should enjoy a benefice, or hold his own country; that no ecclesiastic should have a bishopric; that the quality of the clergy and monks, which should be abolished, and, which was the best of all these proposals, that the effects and persons of ecclesiastics should be given to the poor. They concluded with complaining of the prodigious number of indigent and ragged priests who frequented St Peter's church; and declared, that it was a great scandal to see the whores lodged so magnificently at Rome, and riding through the streets on fine mules, while the cardinals and other ecclesiastics accompanied them in the most courteous manner. This plan of reformation was turned into ridicule by Luther and Sturm; and indeed it left unredressed the most intolerable grievances of which the Protestants complained.

23  
Council of  
Trent pro-  
posed.24  
Plan of re-  
formation  
proposed  
by the  
pope.

All this time the emperor had been labouring to persuade the Protestants to consent to the meeting of the council at Trent; but when he found them fixed in their opposition to this measure, he began to listen to the sanguinary measures of the pope, and resolved to terminate the disputes by force of arms. The elector of Saxony and landgrave of Hesse, who were the chief supporters of the Protestant cause, upon this took proper

reconciliation  
by  
Melancthon.

this man had not the courage of Luther; and was therefore on all occasions ready to make concessions, and to propose schemes of accommodation. In the present case, therefore, he gave it as his opinion, that the whole of the book called *Interim* could not by any means be adopted by the Protestants; but at the same time he declared, that he saw no reason why this book might not be approved, adopted and received, as an authoritative rule in things that did not relate to the essential parts of religion, and which he accounted indifferent. But this scheme, instead of cementing the differences, made them much worse than ever, and produced a division among the Protestants themselves, which might have overthrown the Reformation entirely, if the emperor and pope had seized the opportunity.

31  
A new  
council at  
proposed at  
Trent.

In the year 1549, the pope (Paul III.) died; and was succeeded by Julius III. who, at the repeated solicitations of the emperor, consented to the re-assembling of a council at Trent. A diet was again held at Augsburg under the cannon of an imperial army, and Charles laid the matter before the princes of the empire. Most of those present gave their consent to it, and among the rest Maurice elector of Saxony; who consented on the following conditions: 1. That the points of doctrine which had already been decided there, should be re-examined. 2. That this examination should be made in presence of the Protestant divines. 3. That the Saxon Protestants should have a liberty of voting as well as of deliberating in the council. 4. That the pope should not pretend to preside in that assembly, either in person or by his legates. This declaration of Maurice was read in the diet, and his deputies insisted upon its being entered into the registers, which the archbishop of Mentz obstinately refused. The diet was concluded in the year 1551; and at its breaking up, the emperor desired the assembled princes and states to prepare all things for the approaching council, and promised to use his utmost endeavours to procure moderation and harmony, impartiality and charity in the transactions of that assembly.

32  
The emperor is  
further  
solicited, and  
persuaded to  
peace by  
the elector  
of Saxony.

On the breaking up of the diet, the Protestants took such steps as they thought most proper for their own safety. The Saxons employed Melancthon, and the Wurtembergers Brengius to draw up Confessions of Faith to be laid before the new council. The Saxon divines however, proceeded no farther than Nuremberg, having received secret orders from Maurice to stop there: For the elector, perceiving that Charles had formed designs against the liberties of the German princes, resolved to take the most effectual measures for crushing his ambition at once. He therefore entered with the utmost secrecy and expedition into an alliance with the king of France, and several of the German princes, for the security of the rights and liberties of the empire; after which, assembling a powerful army: in 1552, he marched against the emperor who lay with a handful of troops at Inspruck, and expected no such thing. By this sudden and unforeseen accident Charles was so much dispirited, that he was willing to make peace almost on any terms. The consequence of this was, that he concluded a treaty at Passau, which by the Protestants is considered as the basis of their religious liberty. By the first three articles of this treaty it

was agreed that Maurice and the confederates should lay down their arms, and lend their troops to Ferdinand to assist him against the Turks; and that the landgrave of Hesse should be set at liberty. By the fourth it was agreed, that the Rule of Faith called the *Interim* should be considered null and void; that the contending parties should enjoy the free and undisturbed exercise of their religion, until a diet should be assembled to determine amicably the present disputes (which diet was to meet in the space of six months); and that this religious liberty should continue always, in case it should be found impossible to come to an uniformity in doctrine and worship. It was also determined, that all those who had suffered banishment, or any other calamity, on account of their having been concerned in the league or war of Smalcald, should be reinstated in their privileges, possessions, and employments; that the imperial chamber at Spire should be open to the Protestants as well as to the Catholics; and that there should always be a certain number of Lutherans in that high court.—To this peace Albert, margrave of Brandenburg, refused to subscribe; and continued the war against the Roman Catholics, committing such ravages in the empire, that a confederacy was formed against him. At the head of this confederacy was Maurice elector of Saxony, who had the year before received in a battle fought near the city of Mühlberg.

The assembling of the diet proposed at Augsburg was prevented by various incidents, and was not held at Augsburg in 1555, where it was again convened in the name of the emperor, and attended with those deplorable calamities which had so long afflicted the empire. After various debates, the following articles were passed, on the 25th of September: That the Protestants who followed the Confession of Augsburg should be for the future considered as entirely separated from the jurisdiction of the Roman pontiff, and from the jurisdiction and superintendence of the bishops; that they were put at perfect liberty to enact laws for themselves relating to their religious sentiments, discipline, and worship; that all the inhabitants of the German empire should be allowed to judge for themselves in religious matters, and to join themselves to that church whose doctrine and worship they thought the most pure and conformable to the spirit of true Christianity; and that all those who should injure or persecute any person under religious pretences, and on account of their opinions, should be declared and proceeded against as public enemies of the empire, invaders of its liberty, and disturbers of its peace.

Thus was the Reformation established in many parts of the German empire, where it continues to this day; nor have the efforts of the Popish powers at any time been able to suppress it, or even to prevent it from gaining ground. It was not, however, in Germany alone that a reformation of religion took place. Almost all the kingdoms of Europe began to open their eyes to the truth about the same time. The reformed religion was propagated in Sweden, soon after Luther's rupture with the church of Rome, by one of his disciples named *Olaus Petri*. The zealous efforts of his missionary were seconded by Gustavus Vasa, whom the Swedes had raised to the throne in place of Christiern king of Denmark, whose horrid barbarity lost him the crown. This prince, however, was as prudent

Sweden.

Reforma-  
tion.

prudent as he was zealous; and, as the minds of the Swedes were in a fluctuating state, he wisely avoided all kind of vehemence and precipitation in spreading the new doctrine. Accordingly, the first object of his attention was the instruction of his people in the sacred doctrines of the Holy Scriptures: for which purpose he invited into his dominions several learned Germans, and spread abroad through the kingdom the Swedish translation of the Bible that had been made by Olaus Petri. Some time after this, in 1526, he appointed a conference at Upsal, between this reformer and Peter Gallius, a zealous defender of the ancient superstition, in which each of the champions was to bring forth his arguments, that it might be seen on which side the truth lay. In this dispute Olaus obtained a signal victory; which contributed much to confirm Gustavus in his persuasion of the truth of Luther's doctrine, and to promote its progress in Sweden. The following year another event gave the finishing stroke to its propagation and success. This was the assembly of the States at Upsal, where Gustavus recommended the doctrine of the Reformation with such zeal, that, after words had been passed by the clergy in general, it was proclaimed by the king, that the reformation introduced by Luther should be made in Sweden. This resolution was confirmed by the firmness and magnanimity of the king, who declared publicly, that he would not suffer his subjects to follow and retire from the Reformation, but that he would have the people enslaved by the ordinances of the pope, and more controlled by the bishops than by the laws of the country. From this time the papal empire in Sweden was completely overthrown, and Gustavus declared himself a Protestant.

In the year 1527, the Reformation was introduced as into the year 1527, in consequence of the ardent desire of Christian II. of having his subjects instructed in the doctrines of Luther. This monarch, notwithstanding his cruelty, for which his name has been rendered odious, was nevertheless desirous of removing his dominions from the tyranny of the church of Rome. For this purpose, in the year 1520, he sent to Martin Reucard, one of the disciples of Carlstadt, into Saxony, and appointed him professor of divinity at Upsal; and after his death, which happened in 1521, he invited Carlstadt himself to fill this important place. Carlstadt accepted of this office indeed; but in a short time returned to Germany, upon which Christian used his utmost endeavours to engage Luther to visit his dominions, but in vain. However, the progress of Christian, in reforming the religion of his subjects, or rather of advancing his own power above that of the church, was checked, in the year 1523, by a conspiracy, by which he was deposed and banished; his uncle Frederic, duke of Holstein and Sleswig, being appointed his successor.

Frederic conducted the Reformation with much greater prudence than his predecessor. He permitted the Protestant doctors to preach publicly the sentiments of Luther, but did not venture to change the established government and discipline of the church. However, he contributed greatly to the progress of the Reformation, by his successful attempts in favour of religious liberty in an assembly of the states held at Odensee in 1527. Here he procured the publication of a famous

edict, by which every subject of Denmark was declared free either to adhere to the tenets of the church of Rome, or to the doctrine of Luther. The papal tyranny was totally destroyed by his successor Christian III. He began by suppressing the despotic authority of the bishops, and restoring to their lawful owners a great part of the wealth and possessions which the church had acquired by various stratagems. This was followed by a plan of religious doctrine, worship, and discipline, laid down by Bugenhagen, whom the king had sent for from Wittemberg for that purpose; and in 1539 an assembly of the states at Odensee gave a solemn sanction to all these transactions.

In France also, the Reformation began to make some progress very early. Margaret queen of Navarre, sister to Francis I. the perpetual rival of Charles V. was a great friend to the new doctrine; and it appears that, as early as the year 1523, there were in several of the provinces of France great numbers of people who had conceived the greatest aversion both to the doctrine and tyranny of the church of Rome; among whom were many of the first rank and dignity, and even some of the episcopal order. But as their number increased daily, and troubles and commotions were excited in several places on account of the religious differences, the authority of the king intervened, and many persons eminent for their virtue and piety were put to death in the most barbarous manner. Indeed, Francis, who had either no religion at all, or, at best, no fixed and consistent system of religious principles, conducted himself towards the Protestants in such a manner as best answered his private views. Sometimes he resolved to invite Melancthon into France, probably with a view to please his sister the queen of Navarre, whom he loved tenderly, and who had strongly inhibited the Protestant principles. At other times he exercised the most infernal cruelty towards the reformed; and once made the following mad declaration, 'That if he thought the blood in his arm was tainted by the Lutheran heresy, he would have it cut off; and that he would not spare even his own children, if they entertained sentiments contrary to those of the Catholic church.'

About this time the famous Calvin began to draw the attention of the public, but more especially of the queen of Navarre. His zeal exposed him to danger; and the friends of the Reformation, whom Francis was daily committing to the flames, placed him more than once in the most perilous situation, from which he was delivered by the interposition of the queen of Navarre. He therefore retired out of France to Basil in Switzerland; where he published his Christian Institutions, and became afterwards so famous.

Those among the French who first renounced the jurisdiction of the Romish church, are commonly called *Lutherans* by the writers of those early times. Hence it has been supposed that they had all imbibed the peculiar sentiments of Luther. But this appears by no means to have been the case; for the vicinity of the cities of Geneva, Lausanne, &c. which had adopted the doctrines of Calvin, produced a remarkable effect upon the French Protestant churches; inasmuch that, about the middle of this century, they all entered into communion with the church of Geneva. The French Protestants were called *Huguenots* \* by their ad-

verfuries, by way of contempt. Their fate was very severe, being persecuted with unparalleled fury; and though many princes of the blood, and of the first nobility, had embraced their sentiments, yet in no part of the world did the reformers suffer so much \*. At last all commotions were quelled by the fortitude and magnanimity of Henry IV. who in the year 1598 granted all his subjects full liberty of conscience by the famous edict of Nantz, and seemed to have thoroughly established the Reformation throughout his dominions. During the minority of Louis XIV. however, this edict was revoked by Cardinal Mazarine, since which time the Protestants have often been cruelly persecuted; nor was the profession of the reformed religion in France at any time so safe as in most other countries of Europe. See REVOLUTION.

57  
In the Netherlands,  
&c.

In the other parts of Europe the opposition to the church of Rome was but faint and ambiguous before the diet of Augsberg. Before that period, however, it appears from undoubted testimony, that the doctrine of Luther had made a considerable, though probably secret, progress through Spain, Hungary, Bohemia, Britain, Poland, and the Netherlands; and had in all these countries many friends, of whom several repaired to Wittemberg, in order to enlarge their knowledge by means of Luther's conversation. Some of these countries threw off the Roman yoke entirely, and in others a prodigious number of families embraced the principles of the reformed religion. It is certain indeed, and the Roman Catholics themselves acknowledge it without hesitation, that the Papal doctrines and authority would have fallen into ruin in all parts of the world at once, had not the force of the secular arm been employed to support the tottering edifice. In the Netherlands particularly, the most grievous persecutions took place, so that by the emperor Charles V. upwards of 100,000 were destroyed, while still greater cruelties were exercised upon the people by his son Philip II. The revolt of the United Provinces, however, and motives of real policy, at last put a stop to these furious proceedings; and, though in many provinces of the Netherlands, the establishment of the Popish religion was still continued, the Protestants have been long free of the danger of persecution on account of the principles.

38  
In Italy.

The Reformation made a considerable progress in Spain and Italy soon after the rupture between Luther and the Roman pontiff. In all the provinces of Italy, but more especially in the territories of Venice, Tuscany, and Naples, the superstition of Rome lost ground, and great numbers of people of all ranks expressed an aversion to the Papal yoke. This occasioned violent and dangerous commotions in the kingdom of Naples in the year 1546; which, however, were at last quelled by the united efforts of Charles V. and his viceroy Don Pedro di Toledo. In several places the pope put a stop to the progress of the Reformation, by letting loose the inquisitors; who spread dreadful marks of their barbarity through the greatest part of Italy. These formidable ministers of superstition put so many to death, and perpetrated such horrid acts of cruelty and oppression, that most of the reformed consulted their safety by a voluntary exile, while others returned to the religion of Rome, at least in external appearance. But the inquisition, which frightened into the profession of Popery several Protestants in other parts of Italy,

could never make its way into the kingdom of Naples; nor could either the authority or excommunications of the pope engage the Neapolitans to admit even visiting inquisitors.

39

In Spain, several people embraced the Protestant religion, not only from the controversies of Luther, but even from those divines whom Charles V. had brought with him into Germany in order to refute the doctrines of Luther. For these doctors imbibed the pretended heresy instead of refuting it, and propagated it more or less on their return home. But the inquisition, which could obtain no footing in Naples, reigned triumphant in Spain, and by the most dreadful methods frightened the people back into Popery, and suppressed the desire of exchanging their superstition for a more rational plan of religion. It was indeed presumed that Charles himself died a Protestant; and it seems to be certain, that, when the approach of death had dissipated those schemes of ambition and grandeur which had so long blinded him, his sentiments became much more rational and agreeable to Christianity than they had ever been. All those who had attended him, as soon as they were sent to the inquisition, and committed to the flames, put to death by some other method, or otherwise. Such was the fate of Augustinus, a learned and pious friend of Constantine Pontius, the emperor of Constantinople, whom he had named to the bishopric of Constantinople, and Bartholomew de Caranza, a Dominican, who was confessor to King Philip and Queen Elizabeth, and others of less note.

In England, the principles of the Reformation began to be adopted as soon as the doctrines of Luther could be conveyed thither. In the reign of Henry VIII. there were still great remains of the old superstitions, whose doctrine resembled that of Luther, and among whom, of consequence, the doctrine of the reformed gained great credit. Henry VIII. himself was a violent persecutor of the church of Rome, and had a particular veneration for the writings of Thomas Aquinas. Being dissatisfied that Luther spoke of his favourite author with contempt, he conceived a violent prejudice against the reformed, and even wrote against him, as we have already observed. Luther did not hesitate at writing against his majesty, overcame him in argument, and treated him with very little ceremony. The first step towards public reformation, however, was not taken till the year 1534. Great complaints had been made in England, and of a very ancient date, of the usurpations of the clergy; and by the prevalence of the Lutheran opinions, these complaints were now become more general than before. The house of commons, finding the occasion favourable, passed several bills, restraining the impositions of the clergy: but what threatened the ecclesiastical order with the greatest danger were the severe reproaches thrown out almost without opposition in the house against the dissolute lives, ambition, and avarice of the priests, and their continual encroachments on the privileges of the laity. The bills for regulating the clergy met with opposition in the house of lords; and Bishop Fisher imputed them to want of faith in the commons, and to a formed design, proceeding from heretical and Lutheran principles, of robbing the church of her patrimony, and overturning the national religion. The commons, however, complain-

Reformation.

ed to the king, by their speaker Sir Thomas Audley, of these reflections thrown out against them; and the bishop was obliged to retract his words.

Though Henry had not the least idea of rejecting any, even the most absurd Romish superstitions, yet as the oppressions of the clergy suited very ill with the violence of his own temper, he was pleased with every opportunity of lessening their power. In the parliament of 1531, he showed his design of humbling the clergy in the most effectual manner. An obsolete statute was revived, from which it was pretended that it was criminal to submit to the legatine power which had been exercised by Cardinal Wolsey. By this broke the whole body of clergy was declared guilty at once. They were too well acquainted with Henry's disposition, however, to reply, that their sins would have been the certain consequence of their not submitting to Wolsey's commission which had been given by royal authority. Instead of making any defence of this kind, they shewed their submission to the mercy of their sovereign, and begged pardon for them 118,840*l.* to prevent a rebellion and likewise extorted from them, that the king was the supreme and supreme head of the church of England, though some of them had the conscience of the pope, which invalidated the pope's authority. *per se* is permitted by the

Henry began to reduce the power of the clergy, and to break with them afterwards. He was not contented with any reformation in religious matters, but he persecuted most violently such as did not conform to his views. Indeed, the most essential part of the reformation had been his own supremacy, which he was sure to suffer the Protestants or Papists. He was not contented with the absurd and cruel conduct of this reformation, but he quarrelled with the pope on account of his refusal to dispense to marry Anne Boleyn, a girl under the article ENGLAND, N° 253—

in 1547, and was succeeded by his only son, Edward VI. This amiable prince, whose early years were distinguished by wisdom, sagacity, and virtue, would have done honour to advanced years, gave new spirit and vigour to the Protestant cause, and was its brightest ornament, as well as its most effectual support. He encouraged learned and pious men of foreign countries to settle in England, and addressed a particular invitation to Martin Bucer, and Paul Fagius, whose moderation added a lustre to their other virtues, that, by the ministry and labours of these eminent men, in concert with those of the friends of the Reformation in England, he might purge his dominions from the fordid fictions of Popery, and establish the pure doctrines of Christianity in their place. For this purpose he issued out the wisest orders for the restoration of true religion; but his reign was too short to accomplish fully such a glorious purpose. In the year 1553, he was taken from his loving and afflicted subjects, whose sorrow was inexpressible, and suited to their loss. His sister Mary (the daughter of Catharine of Arragon, from whom Henry had been separated by the famous divorce), a furious bigot to the church of Rome, and a princess whose natural character, like the spirit of her religion, was despotic and cruel, succeeded him on the British throne, and imposed anew the arbi-

VOL. XVI. Part I.

trary laws and the tyrannical yoke of Rome upon the people of England. Nor were the methods she employed in the cause of superstition better than the cause itself, or tempered by any sentiments of equity or compassion. Barbarous tortures, and death in the most shocking forms, awaited those who opposed her will, or made the least stand against the restoration of Popery. And among many other victims, the learned and pious Cranmer, archbishop of Canterbury, who had been one of the most illustrious instruments of the Reformation in England, fell a sacrifice to her fury. This odious scene of persecution was happily concluded in the year 1558, by the death of the queen, who left no issue; and, as soon as her successor the lady Elizabeth ascended the throne, all things assumed a new and a pleasing aspect. This illustrious princess, whose sentiments, counsels, and projects, breathed a spirit superior to the natural softness and delicacy of her sex, exerted this vigorous and manly spirit in the defence of oppressed conscience and expiring liberty, broke anew the despotism of Papal authority and superstition, and, delivering her people from the bondage of Rome, established that form of religious doctrine and ecclesiastical government which still subsists in England. This religious establishment differs, in some respects, from the plan that had been formed by those whom Edward VI. had employed for promoting the cause of the Reformation, and approaches nearer to the rites and discipline of former times; though it is widely different, and, in the most important points, entirely opposite to the principles of the Roman hierarchy. See ENGLAND, N° 293, &c.

The cause of the reformation underwent in Ireland the same vicissitudes and revolutions that had attended it in England. When Henry VIII. after the abolition of the Papal authority, was declared supreme head upon earth of the church of England, George Brown, a native of England, and a monk of the Augustine order, whom that monarch had created, in the year 1535 archbishop of Dublin, began to act with the utmost vigour in consequence of this change in the hierarchy. He purged the churches of his diocese from superstition in all its various forms, pulled down images, destroyed relics, abolished absurd and idolatrous rites, and, by the influence as well as authority he had in Ireland, caused the king's supremacy to be acknowledged in that nation. Henry showed, soon after, that this supremacy was not a vain title; for he banished the monks out of that kingdom, confiscated their revenues, and destroyed their convents. In the reign of Edward VI. still farther progress was made in the removal of Popish superstitions, by the zealous labours of Bishop Brown, and the auspicious encouragement he granted to all who exerted themselves in the cause of the Reformation. But the death of this excellent prince, and the accession of Queen Mary, had like to have changed the face of affairs in Ireland as much as in England; but her designs were disappointed by a very curious adventure, of which the following account has been copied from the papers of Richard earl of Corke. "Queen Mary having dealt severely with the Protestants in England, about the latter end of her reign signed a commission for to take the same course with them in Ireland; and to execute the same with greater force, she nominated Dr Cole one of the commissioners. This Doctor coming, with the commission, to Chester

Curious description of a Popish doctor in Ireland.

Reforma-  
tion.

on his journey, the mayor of that city hearing that her majesty was sending a messenger into Ireland, and he being a churchman, waited on the doctor, who in discourse with the mayor taketh out of a cloak-bag a leather box, saying unto him, *Here is a commission that shall lash the Heretics of Ireland*, calling the Protestants by that title. The good woman of the house being well affected to the Protestant religion, and also having a brother named *John Edmonds* of the same, then a citizen in Dublin, was much troubled at the doctor's words; but watching her convenient time while the mayor took his leave, and the doctor complimented him down the stairs, she opens the box, takes the commission out, and places in lieu thereof a sheet of paper with a pack of cards wrapt up therein, the knave of clubs being faced uppermost. The doctor coming up to his chamber, suspecting nothing of what had been done, put up the box as formerly. The next day going to the water side, wind and weather serving him, he sails toward Ireland, and landed on the 7th of October 1558 at Dublin. Then coming to the castle, the lord Fitzwalters being lord-deputy, sent for him to come before him and the privy-council; who, coming in, after he had made a speech relating upon what account he came over, he presents the box unto the lord-deputy; who causing it to be opened, that the secretary might read the commission, there was nothing save a pack of cards with the knave of clubs uppermost; which not only startled the lord-deputy and council, but the doctor, who assured them he had a commission, but knew not how it was gone. Then the lord-deputy made answer: Let us have another commission, and we will shuffle the cards in the meanwhile. The doctor being troubled in his mind, went away, and returned into England, and coming to the court obtained another commission; but staying for a wind on the water-side, news came to him that the queen was dead: and thus God preserved the Protestants of Ireland. Queen Elizabeth was so delighted with this story, which was related to her by Lord Fitzwalters on his return to England, that she sent for Elizabeth Edmonds, whose husband's name was *Matterbad*, and gave her a pension of 40l. during her life.

43  
Of the Re-  
formation  
in Scotland:

In Scotland, the seeds of reformation were very early sown, by several noblemen who had resided in Germany during the religious disputes there. But for many years it was suppressed by the power of the pope, seconded by inhuman laws and barbarous executions. The most eminent opposer of the papal jurisdiction was John Knox, a disciple of Calvin, a man of great zeal and invincible fortitude. On all occasions he raised the drooping spirits of the reformers, and encouraged them to go on with their work notwithstanding the opposition and treachery of the queen-regent; till at last, in 1561, by the assistance of an English army sent by Elizabeth, Popery was in a manner totally extirpated throughout the kingdom. From this period the form of doctrine, worship, and discipline established by Calvin at Geneva, has had the ascendancy in Scotland. But for an account of the difficulties which the Scottish reformers had to struggle with, and the manner in which these were overcome, &c. see SCOTLAND.

For further information on the subject of the reformation in general, we refer our readers to the works of Burnet and Brandt, to Beaufobre's *Histoire de la Réformation dans l'Empire, et les Etats de la Confession*

*d'Augsbourg depuis 1517—1530*, in 4 vols. 8vo, Berlin 1785, and Mosheim's Ecclesiastical History. See also Sleidan *De Statu Religionis et Reipublica sub Carolo V.*; *Cesaris Commentarii*; and Father Paul's History of the Council of Trent.

Respectie  
Refuge.

REFRACTION, in general, is the deviation of a moving body from its direct course, occasioned by the different density of the medium in which it moves; or it is a change of direction occasioned by a body's falling obliquely out of one medium into another. The word is chiefly made use of with regard to the rays of light. See OPTICS (Index) at *Refraction*.

REFRANGIBILITY OF LIGHT, the disposition of rays to be refracted. The term is chiefly applied to the disposition of rays to produce different colours, according to their different degrees of refrangibility. See CHROMATICS and OPTICS *passim*.

REFRIGERATIVE, in medicine, a remedy which refreshes the inward parts by cooling them; as clysters, pissana, &c.

REFRIGERATORY, in chemistry, a vessel filled with cold water, through which are worn pipes in distillations; the use of which is to condense the vapours as they pass through the water.

CITIES OF REFUGE, were places promised to the Israelites for such as against their lives sought refuge to kill a man. Of these cities, four were named, and one was added: on this side Jordan were Hebron, Ramoth-Gilead, and Shechem; beyond Jordan were Bezer, Ramoth-Gilead. When any of the Israelites were found guilty of murder, they fled to these cities, and there they dwelt, till they were brought before the judges. The manner of their trial was: first before the judges of the city in which he had fled; and secondly before the judges of his own city. If found guilty, he was put to death with all the severity of the law. If he was acquitted, he was not immediately set at liberty; but, to inspire a degree of horror against even involuntary homicide, he was reconducted to the place of refuge, and obliged to continue there in a sort of banishment till the death of the high-priest. If, before this time, he ventured, or the revenger of blood might freely kill him; but after the high-priest's death he was at liberty to go where he pleased without molestation. It was necessary that the person who fled to any of the cities of refuge should understand some trade or calling, that he might not be burdensome to the inhabitants. The cities of refuge were required to be well supplied with water and necessary provisions. They were also to be of easy access, to have good roads leading to them, with commodious bridges where there was occasion. The width of the roads was to be 32 cubits or 48 feet at least. It was further required, that at all cross-ways direction-posts should be erected, with an inscription pointing out the road to the cities of refuge. The 15th of Adar, which answers to our February moon, was appointed for the city-magistrates to see that the roads were in good condition. No person in any of these cities was allowed to make weapons, lest the relations of the deceased should be furnished with the means of gratifying their revenge. Deut. xix. 3. iv. 41. 43.; Josh. xx. 7. Three other cities of refuge were conditionally promised, but never granted. See AYLUM.

REFUGEES;

Refugees  
Regata.

**REFUGEES**, a term at first applied to the French Protestants, who, by the revocation of the edict of Nantz, were constrained to fly from persecution, and take refuge in foreign countries. Since that time, however, it has been extended to all such as leave their country in times of distress; and hence, since the revolt of the British colonies in America, we have frequently heard of *American Refugees*.

**REGALE**, a magnificent entertainment or treat, given to ambassadors and other persons of distinction, to entertain or do them honour.

It is usual in Italy, at the arrival of a traveller of eminence, to send him a regale, that is, a present of sweetmeats, fruits, &c. by way of refreshment.

**REGALIA**, in law, the rights and prerogatives of a king. See *PARADOXICAL*.

Regalia is also used for the apparatus of a coronation; as the crown, the sceptre with the cross, that with the cross, St Edward's staff, the globe, and the orb with the cross, four several swords, &c.—The regalia of Scotland were deposited in the castle of Edinburgh in the year 1706, in a chest called the *Jewel Office*. This chest was lately opened by some commissioners appointed by the king, when the large chest in which it is deposited was found; but as it is not known whether it has been opened, it is not known whether they be there or not. It is supposed that the regalia were carried to the Tower of London in the reign of Queen Anne; and a crown of gold which is called the Scotch crown. We are told that it is the real crown of Scotland, and that it is the Scotch regalia which was lately found. If they are not, they have been taken away by stealth, and the crown is not to be found down, for we do not believe that the regalia are in the Tower of London.

**REGALITY**, in Scots law. See *LAW*, *SCOTLAND*.

**REGARD**. See *FOREST Courts*.

**REGARDANT**, in heraldry, signifies looking backward; and it is used for a lion, or other beast, with his face turned towards his tail.

**REGARDER**, an ancient officer of the king's forest, to make the regard of the forest every year; that is, to take a view of its limits, to inquire into all offences and defaults committed by the foresters within the forest, and to observe whether all the officers executed their respective duties. See *FOREST Laws*.

**REGATA**, or **REGATTA**, a species of amusement peculiar to the republic of Venice. This spectacle has the power of exciting the greatest emotions of the heart, admiration, enthusiasm, a sense of glory, and the whole train of our best feelings. The grand regata is only exhibited on particular occasions, as the visits of foreign princes and kings at Venice.

It is difficult to give a just idea of the ardour that the notice of a regata spreads among all classes of the inhabitants of Venice. Proud of the exclusive privilege of giving such a spectacle, through the wonderful local circumstances of their city, they are highly delighted with making preparations a long time before, in order to contribute all they can towards the perfection and enjoyment of the spectacle. A thousand interests are formed and augmented every day; parties in favour of the different competitors who are known; the protection of young

noblemen given to the gondoliers in their service; the desire of honours and rewards in the aspirants; and in the midst of all this, that ingenious national industry, which awakes the Venetians from their habitual indolence, to derive advantage from the business and agitation of the moment: all these circumstances united give to the numerous inhabitants of this lively city a degree of spirit and animation which render it during that time a delightful abode in the eyes of the philosopher and the stranger. Crowds of people flock from the adjacent parts, and travellers joyfully repair to this scene of gaiety and pleasure.

Although it is allowable for any man to go and inscribe his name in the list of combatants until the fixed number is complete, it will not be amiss to remark one thing, which has relation to more ancient times. The state of a gondolier is of much consideration among the people; which is very natural, that having been the primitive condition of the inhabitants of this country. But, besides this general consideration, there are among them some families truly distinguished and respected by their equals, whose antiquity is acknowledged, and who, on account of a succession of virtuous men, able in their profession, and honoured for the prizes they have carried off in these contests, form the body of noble gondoliers; often more worthy of that title than the higher order of nobility, who only derive their honours from the merit of their ancestors, or from their own riches. The consideration for those families is carried so far, that, in the disputes frequently arising among the gondoliers in their ordinary passage of the canals, we sometimes see a quarrel instantly made up by the simple interposition of a third person, who has chanced to be of this reverend body. They are rigid with respect to misalliances in their families, and they endeavour reciprocally to give and take their wives among those of their own rank. But we must remark here, with pleasure, that these distinctions infer no inequality of condition, nor admit any oppression of inferiors, being founded solely on laudable and virtuous opinions. Distinctions derived from fortune only, are those which always outrage nature, and often virtue.

In general, the competitors at the great regatas are chosen from among these families of reputation. As soon as they are fixed upon for this exploit, they spend the intermediate time in preparing themselves for it, by a daily, assiduous, and fatiguing exercise. If they are in service, their masters during that time not only give them their liberty, but also augment their wages. This custom would seem to indicate, that they look upon them as persons consecrated to the honour of the nation, and under a sort of obligation to contribute to its glory.

At last the great day arrives. Their relations assemble together; they encourage the heroes, by calling to their minds the records of their families; the women present the oar, beseeching them, in an epic tone, to remember that they are the sons of famous men, whose steps they will be expected to follow; this they do with as much solemnity as the Spartan women presented the shield to their sons, bidding them either return with or upon it. Religion, as practised among the lower class of people, has its share in the preparations for this enterprise. They cause masses to be said; they make vows to some particular church; and they arm their boats for the contest with the images of those saints who are most in vogue. Sorcerers are not forgotten

Regata.

**Regata.** upon this occasion. For gondoliers who have lost the race often declare, that witchcraft had been practised against them, or certainly they must have won the day. Such a supposition prevents a poor fellow from thinking ill of himself; an opinion that might be unfavourable to him another time.

The course is about four miles. The boats start from a certain place, run through the great winding canal which divides the town into two parts, turn round a picket, and, coming back the same way, go and seize the prize, which is fixed at the acute angle of the great canal, on the convex side, so that the point of sight may be the more extended, and the prize seized in the sight of the spectators on both sides.

According to the number of competitors, different races are performed in different sorts of boats; some with one oar and others with two. The prizes proposed are four, indicated by four flags of different colours, with the different value of the prizes marked upon them.—These flags, public and glorious monuments, are the prizes to which the competitors particularly aspire. But the government always adds to each a genteel sum of money; besides that the conquerors, immediately after the victory, are surrounded by all the *beau monde*, who congratulate and make them presents; after which they go, bearing their honourable trophy in their hand, down the whole length of the canal, and receive the applause of innumerable spectators.

This grand canal, ever striking by the singularity and beauty of the buildings which border it, is, upon these occasions, covered with an infinity of spectators, in all sorts of barges, boats, and gondolas. The element on which they move is scarcely seen; but the noise of oars, the agitation of arms and bodies in perpetual motion, indicate the spectacle to be upon the water. At certain distances, on each side of the shore, are erected little amphitheatres and scaffoldings, where are placed bands of music; the harmonious sound of which predominates now and then over the buzzing noise of the people. Some days before a *regata*, one may see on the great canal many boats for pleasure and entertainment. The young noble, the citizen, the rich artizan, mounts a long boat of six or eight oars; his gondoliers decorated with rich and singular dresses, and the vessel itself adorned with various stuffs. Among the nobles there are always a number who are at a considerable expence in these decorations; and at the *regata* itself exhibit on the water personages of mythologic story, with the heroes of antiquity in their train, or amuse themselves with representing the costumi of different nations: in short, people contribute with a mad sort of magnificence, from all quarters, to this masquerade, the favourite diversion of the Venetians. But these great machines, not being the less in motion on account of their ornaments, are not merely destined to grace the show: they are employed at the *regata*, at every moment, to range the people, to protect the course, and to keep the avenue open and clear to the goal. The nobility, kneeling upon cushions at the prow of their vessels, are attentive to these matters, and announce their orders to the most restive, by darting at them little gilded or silvered balls, by means of certain bows, with which they are furnished on this occasion. And this is the only appearance of coercion in the Venetian police on these days of the greatest tumult: nor is there to be seen, in any part of the city, a body of

guards or patrol, nor even a gun or a halbert. The mildness of the nation, its gaiety, its education in the habit of believing that the government is ever awake; that it knows and sees every thing; its respectful attachment to the body of patricians; the sole aspect of certain officers of the police in their robes, dispersed in different places, at once operate and explain that tranquillity, that security, which we see in the midst of the greatest confusion, and that surprising docility in so lively and fiery a people. Regattas have been attempted on the river Thames, but they were but humble imitations of the Venetian amusement.

**REGEL, or RIGEL**, a fixed star of the first magnitude, in Orion's left foot.

**REGENERATION**, in theology, the act of being born again by a spiritual birth; or the change of heart and life experienced by a person who forsakes a course of vice, and sincerely embraces a life of virtue and piety.

**REGENSBURG, or RAYSSON.** See RAYSSON.

**REGENT**, one who governs a kingdom during the minority or absence of the king.

In France, the queen-mother had the regency of the kingdom during the minority of the king, under the title of *queen-regent*.

In England, the method of appointing this guardian or regent hath been various, and the duration of his power is uncertain, but from some accounts may be collected that the office is almost always common law; and therefore (see the Statute 4 Inst. 58.) the surest way is to have the authority of the great council, as was done by Henry IV. who was proclaimed king by his own authority, and afterwards confirmed by the great council. At other times the regency of Henry VI. who was then only nine years old; but was declared at 17 by the pope at 17, confirmed the great council, and took upon him the administration of the government. At 20. A guardian and council of regents was appointed for Edward III. by the parliament which elected his father; the young king being then 13, and continuing the government till three years after. When Richard II. succeeded at the age of 11, the duke of Lancaster took upon him the management of the kingdom till the parliament met, which appointed a nominal council, and Henry V. on his death-bed named a regent and guardian for his infant son Henry VI. then nine months old; but the parliament altered his disposition; and appointed a protector and council, with a special limited authority. Both these princes remained in a state of pupillage till the age of 23. Edward V. at the age of 13, was recommended by his father to the care of the duke of Gloucester, who was declared protector by the privy council. The statutes 25 Hen. VIII. c. 12. and 28 Hen. VIII. c. 7. provided, that the successor, if a male and under 18, or if a female and under 16, should be till such age in the governance of his or her natural mother, (if approved by the king), and such other counsellors as his majesty should by will or otherwise appoint: and he accordingly appointed his 16 executors to have the government of his son Edward VI. and the kingdom, which executors elected the earl of Hartford protector. The statutes 24 Geo. II. c. 24. in case the crown should descend to any of the children of Frederick late prince of Wales under the age of 18, appointed the princess dowager;—and that of 5 Geo. III. c. 27. in case of a like descent to any of his present majesty's children, empowers the king to name either the queen

Regiomontanus  
Register.

Regiments were first formed in France in the year 1558, and in England in the year 1660.

REGIOMONTANUS. See MULLER.

REGION, in geography, a large extent of land, inhabited by many people of the same nation; and enclosed within certain limits or bounds.

The modern astronomers divide the moon into several regions, or large tracts of land, to each of which they give its proper name.

REGION, in physiology, is taken for a division of our atmosphere, which is divided into the upper, middle, and lower regions.

The upper region commences from the tops of the mountains, and reaches to the utmost limits of the atmosphere. In this region reign a perpetual, equable, calmness, clearness, and serenity. The middle region is that in which the clouds reside, and where meteors are formed, extending from the extremity of the lowest to the tops of the highest mountains. The lowest region is that in which we breathe, which is bounded by the reflection of the sun's rays; or by the height to which they rebound from the earth. See ATMOSPHERE and AIR.

*Ethereal REGION*, in cosmography, is the whole extent of the universe, in which is included all the heavenly bodies, and even the orb of the fixed stars.

*Elementary REGION*, according to the Aristotelians, is a sphere terminated by the concavity of the moon's orb, comprehending the atmosphere of the earth.

REGION, in anatomy, a division of the human body, otherwise called *cavity*, of which anatomists reckon three, viz. the upper region, or that of the head; the middle region, that of the thorax or breast; and the lower, the abdomen, or belly. See ANATOMY.

REGION, in ancient Rome, was a part or division of the city. The regions were only four in number, till Augustus Caesar's time, who divided the city into fourteen; over each of which he settled two surveyors, called *curatores viarum*, who were appointed annually, and took their divisions by lot. These fourteen regions contained four hundred and twenty-four streets, thirty-one of which were called *greater* or *royal streets*, which began at the gilt pillar that stood at the entry of the open place, in the middle of the city. The extent of these divisions varied greatly, some being from 12000 or 13000 to 33000 feet or upwards in circumference. Authors, however, are not agreed as to the exact limits of each. The *curatores viarum* wore the purple, had each two lictors in their proper divisions, had slaves under them to take care of fires, that happened to break out. They had also two officers, called *denunciatores*, in each region, to give account of any disorders. Four *vico-magistri* also were appointed in each street, who took care of the streets allotted them, and carried the orders of the city to each citizen.

REGISTER, a public-book, in which are entered and recorded memoirs, acts, and minutes, to be had recourse to occasionally for knowing and proving matters of fact. Of these there are several kinds; as,

1. Register of deeds in Yorkshire and Middlesex, in which are registered all deeds, conveyances, wills, &c. that affect any lands or tenements in those counties, which are otherwise void against any subsequent purchasers or mortgagees, &c. but this does not extend to any copyhold estate, nor to leases at a rack rent, or

where they do not exceed 21 years. The registered memorials must be ingrossed on parchment, under the hand and seal of some of the granters or grantees, attested by witnesses who are to prove the signing or sealing of them and the execution of the deed. But these registers, which are confined to two counties, are in Scotland general, by which the laws of North Britain are rendered very easy and regular. Of these there are two kinds; the one general, fixed at Edinburgh, under the direction of the lord register; and the other is kept in the several shires, stewartries, and regalities, the clerks of which are obliged to transmit the registers of their respective courts to the general register.

2. Parish registers are books in which are registered the baptisms, marriages, and burials, of each parish.

Registers were kept both at Athens and Rome, in which were inserted the names of such children as were to be brought up, as soon as they were born. Marcus Aurelius ordered all free persons to give in accounts of their children, within 30 days after the birth, to the treasury of the empire, in order to their being deposited in the temple of Saturn, where the public acts were kept. There were also appointed as public registers in the provinces, that records might be had to their limits of justice, for settling disputes, or settling any person's freedom.

REGISTER SHIP, a vessel which is permitted to obtain a permission either from the council of the Indies, to trade in the Spanish West Indies; which are then called *galleons*, or being registered before they set sail, to trade in the Spanish Ayres.

REGISTERS, in mechanics, are valves, or stopples, contrived in the pistons of steam engines, to regulate the fire; that is, to admit of more or less of steam, or remiss, by opening them in some degree, or shutting them close to exclude it. See STEAM ENGINE.

REGISTRAR, an officer in the public registries, who has the keeping of all the public records.

REGIUM, *Regium Lepidi*, *Regium Lepidum*, (see geog.) a town of Cisalpine Gaul, on the *Via Emilia*, so called from *Æmilus Lepidus*, who was consul with C. Flaminius; but whence it was furnished with water is altogether uncertain. Tacitus relates, that at the battle of Bedriacum, a bird of an unusual size was seen preying in a famous grove near *Regium Lepidum*. Now called *Reggio*, a city of Modena. E. Long. 11. 0. N. Lat. 44. 45. See REGORD.

REGNARD (John Francis), one of the best French comic writers after Moliere, was born at Paris in 1647. He had scarcely finished his studies, when an ardent passion for travelling carried him over the greatest part of Europe. When he settled in his own country, he was made a treasurer of France, and lieutenant of the waters and forests; he wrote a great many comedies; and, though naturally of a gay genius, died of chagrin in the 52d year of his age. His works, consisting of comedies and travels, were printed at Rouen, in 5 vols. 12mo, 1732.

REGNIER (Mathurin), the first French poet who succeeded in satire, was born at Chartres in 1573. He was brought up to the church, a place for which his debaucheries rendered him very unsuitable; and these by his own confession were so excessive, that at 30 he had

Register  
Regnier.

*Regulus of Arsenic.* See CHEMISTRY, N<sup>o</sup> 1267, &c. and 1285—1294. The ancient process for making regulus.

**Regulus.** **gulus of arsenic** consisted in mixing four parts of arsenic with two parts of black flux, one part of borax, and one part of filings of iron or of copper, and quickly fusing the mixture in a crucible. After the operation is finished, a regulus of arsenic will be found at the bottom of the crucible of a white linn colour, and of considerable solidity. The iron and copper employed in this process are not intended, as in the operation for the martial regulus of antimony, to precipitate the arsenic, and to separate it from sulphur or any other substances, for the white arsenic is pure, and nothing is to be taken from it; but, on the contrary, the inflammable principles are to be added to reduce it to a regulus. The true rule of these metals in the present operation is to unite with the regulus of arsenic, to give it more body, and to prevent its entire dissipation in vapours. Hence the addition of iron, while it procures these advantages, has the inconvenience of altering the purity of the regulus: for the metallic substance obtained is a regulus of arsenic alloyed with iron. It may, however, be purified from the iron by sublimation in a close vessel; by which operation the regulized arsenical part, which is very volatile, is sublimed to the top of the vessel, and is separated from the iron, which being of a fixed nature remains at the bottom. We are not, however, very certain, that in this kind of rectification the regulus of arsenic does not carry along with it a certain quantity of iron; for, in general, a volatile substance raises along with it, in sublimation, a part of any fixed matter with which it happened to be united.

Mr Brandt proposes another method, which we believe is preferable to that described. He directs that white arsenic should be mixed with soap. Instead of the soap, olive-oil may be used, which has been found to succeed well. The mixture is to be put into a retort or glass matrass, and to be distilled or sublimed with fire, at first very moderate, and only sufficient to raise the oil. As the oils, which are not volatile, cannot be distilled but by a heat sufficient to burn and decompose them, the oil therefore which is mixed with the arsenic undergoes these alterations, and after having penetrated the arsenic thoroughly is reduced to a coal. When no more oily vapours rise, we may then know that the oil is reduced to coal. Then the fire must be increased, and the metallized arsenic will be soon sublimed to the upper part of the vessel, in the inside of which it will form a metallic crust. When no more sublimes, the vessel is to be broken, and the adhering crust of regulus of arsenic is to be separated. The regulus obtained by this first operation is not generally perfect, or not entirely so, as a part of it is always overcharged with fuliginous matter, and another part has not enough of phlogiston; which latter part adheres to the inner surface of the crust, and forms a gray or brown crystals. This sublimate must then be mixed with a less quantity of oil, and sublimed a second time like the first; and even, to obtain a good regulus as may be made, a third sublimation is a step added, and without oil, is necessary. During this operation, the oil which rises is more fetid than any other empyreumatic oil, and is almost unpalatable. This smell certainly proceeds from the arsenic; the smell of which is exceedingly strong and disagreeable when heated.

Regulus of arsenic made by the method we have de-  
scribed, and which we consider as the only one which

is pure, has all the properties of a ferri-metal: It has metallic gravity, opacity, and lustre. Its colour is white, and lived; it transmits the air, is very brittle, but much more soluble than any other ferri-metal. It easily loses its inflammable principle, when sublimed in vessels into which this air has access; the sublimate having the appearance of gray flowers, which by repeated sublimations become entirely white, and similar to white crystalline arsenic. When regulus of arsenic is heated quickly and strongly in open air, as under a muffle, it burns with a white or bluish flame, and dissolves in a thick fume, which has a very foetid smell like that of garlic.

Regulus of arsenic may be combined with acids and most metals. See *Ann. Chem. N.° 17*. We shall only farther observe, that, according to Mr. Brandt, in the Swedish Museum, this regulus of arsenic cannot be united with saltpetre, although the phenomena exhibited by white arsenic and regulus of arsenic in solutions and alloys are probably the same; yet an accurate comparison will be found to deserve notice, especially if the regulus and the metallic metal, for such difference must exist, from the greater or less quantity of pure metal which is contained in them, with which it is mixed. See *Ann. Chem. N.° 17*, 1788, &c.

**REGULUS OF COBALT.** This is obtained by fusing the cobalt ore with sulphur and iron, and not yet perfectly purified from cobalt, because it contains a small quantity of mineral properly so called. The semimetal is obtained, in similar manner, for the extraction of metal from cobalt must be thoroughly purified from the sulphur and arsenic, and the earthy and fatty matters, which are contained in the ore. The cobalt thus prepared is fused in a double or triple, its quantity being made deprecitated in salt, and melted in a furnace or in a hot furnace, for this is a necessary condition. When the fusion has been well made, and upon breaking the crucible, after it has solidified, the metallic regulus, covered with a scoria of arsenical colour. The regulus is of a white metallic nature, the surface of its fracture in shole and fine grained, and the semimetal is hard, but brittle. When the fusion has been well made, its surface appears to be covered with many convex pyramids, which cross each other in various directions. All such pyramids contain the bismuth, and when it is much, as of the regulus itself, the bismuth is dissolved by the same operation, and precipitated in the same manner, as the regulus of cobalt; for although these two metals are frequently mixed in the least mineral, that is, in cobalt, they are incapable of uniting together, and are always found distinct and separate from one another when they are melted together. At the bottom of the crucible, there is found both regulus of cobalt and bismuth. The latter, having a greater specific gravity, is found under the former. They may be separated from each other by the blow of a hammer. Bismuth may be easily distinguished from the regulus of cobalt, not only from its location in the crucible, but also by the large living facets which appear in its fracture, and which are very different from the close and coloured grain of regulus of cobalt.

This lamina is more difficult of fusion than any other ;

**Regulus**  
Reichen-  
berg.

other; is less easily calcinable, and much less volatile. Its calx is gray, and more or less brown; and when fused with vitriolic matters, it changes into a beautiful blue glass called *smalt*. The calx, then, is one of those which preserve always a part of their inflammable principle. It is soluble in acids, as the regulus is. This regulus is soluble in vitriolic, marine, nitron acids, and in aqua-regia, to all which it communicates colour. The solution in vitriolic acid is reddish; the solution in marine acid is of a fine bluish-green when hot, and its colour is almost totally effaced when cold, but is easily recoverable by heating it, without being obliged to uncork the bottle containing it. The solution of the calx of regulus of cobalt is the basis of the sympathetic ink; for without marine acid this ink cannot be made. All the solutions of regulus of cobalt may be precipitated by alkalis; and their precipitates are blue, which colour they retain when vitriolized with the strongest fire.

Not only sympathetic ink, but also regulus of cobalt, may be made from the same materials, and sold; which is nothing more than the regulus of cobalt mixed with mucous matter. For this purpose, the regulus of cobalt is dissolved in the powder of flint stone, to which is added a little tartar decoct, and then reduced to a paste with sea salt. Regulus of cobalt is also made by uniting with sulphur: but the regulus of sulphur: and the union is not so perfect as that of M. Berthollet could not separate the two elements otherwise than by precipitation.

Some interesting remarks are still to be collected from the history of this semimetal, and we may derive some information from the endowment of the University of Vienna, which has undertaken the examination of the regulus, particularly has made considerable progress on this subject, part of which he communicates to the public in his Course of Chemistry, and from which we have borrowed the most of the above observations. See CHEMISTRY, N° 1594, &c.

**REHARSALE**, in music and the drama, an essay or experiment of some composition, generally made in private, previous to its representation or performance in public, in order to render the actors and performers more perfect in their parts.

**REICHENBERG**, in Bohemia, 95 miles west of Prague, 305 north-west of Vienna, N. Lat. 50: 2. E. Long. 12: 35. is only remarkable for the place where the Prussian army defeated the Austrians on the 21st of April 1757. The Austrian army commanded by Count Kinsky, was posted near Reichenberg, and was attacked by the Prussians under the command of the prince of Brunswick-Bevern. The Prussians were 20,000, and the Austrians 28,000: the action began at half after six in the morning, when the Prussian lines were formed, and attacked the Austrian cavalry, which was ranged in three lines of 30 squadrons, and their two wings sustained by the infantry, which was posted among felled trees and intrenchments. The Austrians had a village on their right, and a wood on their left, where they were intrenched. The Prussian dragoons and grenadiers cleared the intrenchment and wood, and entirely routed the Austrian cavalry; at the same time, the redoubts that covered Reichenberg were taken by General Lefebvre; and the Austrians were entirely

defeated. The Prussians had seven officers and 160 men killed; 14 officers and 150 men wounded. The Austrians had 1000 men killed and wounded; 20 of their officers and 400 men taken prisoners. The action ended at eleven.

**REINDEER**, or *Toradus*. See CERVUS, N° 4.  
**REINS**, in anatomy, the same with KIDNEYS. See ANATOMY, N° 181.

**REINS of a Bridle**, are two long slips of leather fastened on each side of a curb or snaffle, which the rider holds in his hand, to keep the horse in subjection.

There is also what is called *false reins*; which is a lath or leather, passed sometimes through the arch of the banquet, to bend the horse's neck.

**REJOINDER**, in law, is the defendant's answer to the plaintiff's replication or reply. Thus, in the court of chancery, the defendant puts in an answer to the plaintiff's bill, which is sometimes also called an *answering*; the plaintiff's answer to that is called a *reply*, and the defendant's answer to that a *rejoinder*.

**RELAND** (Adrian), an eminent Orientalist, born at Ryp, in North Holland, in 1676. During three years study under Surenhusius, he made an uncommon progress in the Hebrew, Syriac, Chaldee, and Arabic languages, and these languages were always his favourite study. In 1701, he was, by the recommendation of King William, appointed professor of Oriental languages and ecclesiastical antiquities in the university of Utrecht; and died of the smallpox in 1718. He was distinguished by his modesty, humanity, and learning; and carried on a correspondence with the most eminent scholars of his time. His principal works are, 1. An excellent description of Palestine. 2. Five dissertations on the Medals of the ancient Hebrews, and several other dissertations on different subjects. 3. An Introduction to the Hebrew Grammar. 4. The Antiquities of the ancient Hebrews. 5. On the Mahometan Religion. These works are all written in Latin.

**RELATION**, the mutual respect of two things, or what each is with regard to the other. See METAPHYSICS, N° 93, &c. and 128, &c.

**RELATION**, in geometry. See RATIO.

**RELATION**, is also used for analogy. See ANALOGY, and METAPHYSICS, p. 529, &c.

**RELATIVE**, something relating to or respecting another.

**RELATIVE**, in music. See MODE.

**RELATIVE Terms**, in logic, are words which imply relation: such are master and servant, husband and wife, &c.

In grammar, relative words are those which answer to some other word foregoing, called the *antecedent*; such are the relative pronouns *qui*, *que*, *quod*, &c. and in English, *who*, *whom*, *which*, &c. The word answering to these relatives is often understood, as, "I know whom [you mean]," for "I know the person whom you mean."

**RELAXATION**, in medicine, the act of loosening or slackening; or the looseness or slackness of the fibres, nerves, muscles, &c.

**RELAY**, a supply of horses, placed on the road, and appointed to be ready for a traveller to change, in order to make the greater expedition.

**RELEASE**, in law, is a discharge or conveyance of a man's right in lands or tenements, to another: at

Reindeer  
Release.

Release

Relics

Blackst.  
Comment.

hath some former estate in possession. The words generally used therein are "remised, released, and for ever quit-claimed." And these releases may enure, either, 1. By way of *enlarging an estate*, or *enlarger l'estate*: as, if there be tenant for life or years, remainder to another in fee; and he in remainder releases all his right to the particular tenant and his heirs, this gives him the estate in fee. But in this case the releasor must be in possession of some estate, for the release to work upon; for if there be lessee for years, and, before he enters and is in possession, the lessor releases to him all his right in the reversion, such release is void for want of possession in the releasor. 2. By way of *passing an estate*, or *mitter l'estate*: as, when one of two coparceners releaseth all his right to the other, this passeth the fee-simple of the whole. And, in both these cases, there must be a privity of estate between the releasor and releasor; that is, one of their estates must be so related to the other, as to make but one and the same estate in law. 3. By way of *passing a right*, or *mitter le droit*: as if a man be disseised, and releaseth to his disseisor all his right; hereby the disseisor acquires a new right, which changes the quality of his estate, and renders that lawful which before was tortious. 4. By way of *extinguishment*: as if my tenant for life makes a lease to A for life, remainder to B and his heirs, and I release to A; this extinguishes my right to the reversion, and shall enure to the advantage of B's remainder as well as of A's particular estate. 5. By way of *entry and feoffment*: as if there be two joint disseisors, and the disseisee releases to one of them, he shall be sole seized, and shall keep out his former companion; which is the same in effect as if the disseisee had entered, and thereby put an end to the disseisin, and afterwards had enfeoffed one of the disseisors in fee. And hereupon we may observe, that when a man has in himself the possession of lands, he must at the common law convey the freehold by feoffment and livery; which makes a notoriety in the country: but if a man has only a right or a future interest, he may convey that right or interest by a mere release to him that is in possession of the land: for the occupancy of the releasor is a matter of sufficient notoriety already.

RELEVANCY, in Scots law. See LAW, N° CLXXXVI. 48.

RELICS, in the Romish church, the remains of the bodies or clothes of saints or martyrs, and the instruments by which they were put to death, devoutly preserved, in honour to their memory; kissed, revered, and carried in procession.

The respect which was justly due to the martyrs and teachers of the Christian faith, in a few ages increased almost to adoration; and at length adoration was really paid both to departed saints and to relics of holy men or holy things. The abuses of the church of Rome, with respect to relics, are very flagrant and notorious. For such was the rage for them at one time, that, as F. Mabillon a Benedictine justly complains, the altars were loaded with suspected relics; numerous spurious ones being everywhere offered to the piety and devotion of the faithful. He adds, too, that bones are often consecrated, which, so far from belonging to saints, probably do not belong to Christians. From the catacombs numerous relics have been taken, and yet it is

not known who were the persons interred therein. In the 11th century, relics were tried by fire, and those which did not consume were reckoned genuine, and the rest not. Relics were, and still are, preserved on the altars whereon mass is celebrated; a square hole being made in the middle of the altar, big enough to receive the hand, and herein is the relic deposited, being first wrapped in red silk, and enclosed in a leaden box.

The Romanists plead antiquity in behalf of relics: For the Manichees, out of hatred to the flesh, which they considered as an evil principle, refused to honour the relics of saints; which is reckoned a kind of proof that the Catholics did it in the first ages.

We know, indeed, that the touching of linen cloths on relics; from an opinion of some extraordinary virtue derived therefrom, was as ancient as the first ages, there being a hole made in the collins of the 40 martyrs at Constantinople expressly for this purpose. The honouring the relics of saints, as which the church of Rome afterwards made her superstitious and lucrative use of them, as objects of devotion, and kind of charms or amulets, and as instruments of pretended miracles, appears to have been one of the worst ancient customs, that prevailed among Christians, and continued at the cemeteries or burying places, as well as for the purpose of common

divine worship. When the emperor Constantine the Great, after having obtained the protection of the church, and over their sepulchres, and were treated with every respect. This reverence, and all reasonable bounds, and services were thought to have virtue, which were performed, the practice which afterwards relics of saints and martyrs under churches. This practice was then thought of such importance, that St Ambrose would not consecrate a church because it had no relics; and the council of Constantinople in Trullo ordained, that those churches should be demolished under which there were found no relics. The rage of procuring relics for this and other purposes of a similar nature, became so excessive, that in 386 the emperor Theodosius the Great was obliged to pass a law, forbidding the people to dig up the bodies of the martyrs, and to traffic in their relics.

Such was the origin of that respect for sacred relics, which afterwards was perverted into a formal worship of them, and became the occasion of innumerable processions, pilgrimages, and miracles, from which the church of Rome hath derived incredible advantage. In the end of the ninth century, it was not sufficient to reverence departed saints, and to confide in their intercessions and succours, to clothe them with an imaginary power of healing diseases, working miracles, and delivering from all sorts of calamities and dangers; their bones, their clothes, the apparel and furniture they had possessed during their lives, the very ground which they had touched, or in which their putrified carcases were laid, were treated with a stupid veneration, and supposed to retain the marvellous virtue of healing all disorders both of body and mind, and of defending such as possessed them against all the assaults and devices of the devil.

Relics.

vil. The consequence of all this was, that every one was eager to provide himself with these salutary remedies; consequently, great numbers undertook fatiguing and perilous voyages, and subjected themselves to all sorts of hardships; while others made use of this delusion to accumulate their riches, and to impose upon the miserable multitude by the most impious and shocking inventions. As the demand for relics was prodigious and universal, the clergy employed the utmost dexterity to satisfy all demands, and were far from being nice in the methods they used for that end. The bodies of the saints were sought by fasting and prayer, instituted by the priest in order to obtain a divine answer and an infallible direction, and this pretended direction never failed to accomplish their desires; the holy carcasses were always found, and that always in consequence, as they impiously gave out, of the suggestion and inspiration of God himself. Each discovery of this kind was attended with excessive demonstrations of joy, and animated the zeal of the fervent seekers to enrich the church still more and with new and new kind of treasure. Many travelled and marched into the Eastern provinces, and frequented the places which Christ and his disciples had honoured with their presence, that, with the bones and other small remains of the first heralds of the Gospel, they might comfort dejected minds, calm agitated passions, leave sinking states, and defend themselves from all sorts of calamities. Nor did they return home empty; the craft, industry, and avarice of the Greeks, found a rich prey in the credulity of the Latin relic-hunters, and made a considerable commerce of this new devotion. The sum of considerable sums for legs and arms, heads, and other things that were supposed to have belonged to the primitive worthies of the Christian church; and thus the Latin churches came to the possession of those celebrated relics of St. Mark, St. James, St. Bartholomew, Cyprian, Pantaleon, and others, which they show at this day with so much ostentation. But there were many who, unable to procure for themselves these spiritual treasures by voyages and prayers, had recourse to violence and theft; for all sorts of means, and all sorts of attempts in a cause of this nature, were considered, when successful, as pious and acceptable to the Supreme Being. Besides the arguments from antiquity to which the Papists refer, in vindication of their worship of relics, of which the reader may form some judgment from this article, Bellarmine appeals to Scripture, in support of it, and cites the following passages, viz. Exod. xiii. 19; Deut. xxxiv. 6; 2 Kings xiii. 21; 2 Kings xxiii. 16; 17; 18; Isaiah xi. 10; Matthew xi. 20, 21, 22; Acts. v. 12—15; Acts xix. 11, 12. See POPERY.

The Roman Catholics in Great Britain do not acknowledge any worship to be due to relics, but merely a high veneration and respect, by which means they think they honour God, who, they say, has often wrought very extraordinary miracles by them. But, however proper this veneration and respect may be, its abuse has been so great and so general, as fully to warrant the rejection of them altogether.

Relics are forbidden to be used or brought into England by several statutes; and justices of peace are empowered to search houses for Popish books and relics,

which, when found, are to be defaced and burnt, &c. 3 Jac. I. cap. 26.

RELICT, in law, the same with Widow.

RELIEF (*Relevamen*); but, in Domelday, *Relevatio*, *Relevium*), signifies a certain sum of money, which the tenant, holding by knight's service, grand serjeanty, or other tenure; (for which homage or legal service is due), and being at full age at the death of his ancestor, paid unto his lord at his entrance. See PRIMER.

Though reliefs had their original while feuds were only life-estates, yet they continued after feuds became hereditary; and were therefore looked upon, very justly, as one of the greatest grievances of tenure: especially when, at the first, they were merely arbitrary and at the will of the lord; so that, if he pleased to demand an exorbitant relief, it was in effect to disinherit the heir. The English ill brooked this consequence of their new-adopted policy; and therefore William the Conqueror by his laws ascertained the relief, by directing (in imitation of the Danish heriots), that a certain quantity of arms, and habiliments of war, should be paid by the earls, barons, and vassals respectively; and, if the latter had no arms, they should pay 100s. William Rufus broke through this composition, and again demanded arbitrary uncertain reliefs, as due by the feudal laws; thereby in effect obliging every heir to new-purchase or redeem his land: but his brother Henry I. by the charter before-mentioned, restored his father's law; and ordained, that the relief to be paid should be according to the law so established, and not an arbitrary redemption. But afterwards, when, by an ordinance in 27 Hen. II. called the *assise of arms*, it was provided, That every man's armour should descend to his heir, for defence of the realm, and it thereby became impracticable to pay these acknowledgments in arms according to the laws of the Conqueror, the composition was universally accepted of 100s. for every knight's fee, as we find it ever after established. But it must be remembered, that this relief was only then payable, if the heir at the death of his ancestor had attained his full age of 21 years.

To RELIEVE the GUARD, is to put fresh men upon guard, which is generally every 24 hours.

To RELIEVE the Trenches, is to relieve the guard of the trenches, by appointing those for that duty who have been there before.

To RELIEVE the Sentries, is to put fresh men upon that duty from the guard, which is generally done every two hours, by a corporal who attends the relief, to see that the proper orders are delivered to the soldier who relieves.

RELIEVO, or RELIEF, in sculpture, &c. is the projecture or standing out of a figure which arises prominent from the ground or plane on which it is formed; whether that figure be cut with the chissel, moulded, or cast.

There are three kinds or degrees of relievo, viz. alto, basso, and demi-relievo. The alto-relievo, called also *haut-relief*, or *high-relievo*, is when the figure is formed after nature, and projects as much as the life. Basso-relievo, *bass-relief*, or *low-relievo*, is when the work is raised a little from the ground, as in medals, and the frontispieces of buildings; and particularly in the histo-

Relics.

Relievo.

Relievo,  
Religion.

ries, festoons, foliages, and other ornaments of friezes. Demi-relievo is when one half of the figure rises from the plane. When, in a basso-relievo, there are parts that stand clear out, detached from the rest, the work is called a *demi-basso*.

In architecture, the relievo or projecture of the ornaments ought always to be proportioned to the magnitude of the building it adorns, and to the distance at which it is to be viewed.

RELIEVO, or *Relief*, in painting, is the degree of boldness with which the figures seem, at a due distance, to stand out from the ground of the painting.

The relievo depends much upon the depth of the shadow, and the strength of the light; or on the height of the different colours, bordering on one another; and particularly on the difference of the colour of the figure from that of the ground: thus, when the light is so disposed as to make the nearest parts of the figure advance, and is well diffused on the masses, yet insensibly diminishing, and terminating in a large spacious shadow, brought off insensibly, the relievo is said to be bold, and the clear obscure well understood.

\* *De Natura  
Deorum*,  
Lib. 2. § 28.  
1  
Religion  
defined;

RELIGION (RELIGIO), is a Latin word derived, according to Cicero\*, from *relegere*, "to re-consider;" but according to Servius and most modern grammarians, from *religare*, "to bind fast." The reason assigned by the Roman orator for deducing *religio* from *relego*, is in these words, "qui autem omnia, quæ ad cultum deorum pertinent, diligenter retractor, et tanquam relegerent, sunt dicti *religiosi* ex relegendo." The reason given by Servius for his derivation of the word is, "quod mentem religio religet." If the Ciceronian etymology be the true one, the word *religion* will denote the diligent study of whatever pertains to the worship of the gods; but according to the other derivation, which we are inclined to prefer, it denotes that obligation which we feel on our minds from the relation in which we stand to some superior power. In either case, the import of the word *religion* is different from that of *theology*, as the former signifies a number of practical duties, and the latter a system of speculative truths. *Theology* is therefore the foundation of *religion*, or the science from which it springs: for no man can study what pertains to the worship of superior powers till he believe that such powers exist, or feel any obligation on his mind from a relation of which he knows nothing.

and distin-  
guished  
from theo-  
logy.

This idea of religion, as distinguished from theology, comprehends the duties not only of those more refined and complicated systems of theism or polytheism which have prevailed among civilized and enlightened nations, such as the polytheism of the Greeks and Romans, and the theism of the Jews, the Mahometans, and the Christians; it comprehends every sentiment of obligation which human beings have ever conceived themselves under to superior powers, as well as all the forms of worship which have ever been practised through the world, however fantastic, immoral, or absurd.

3  
It is an im-  
portant sub-  
ject of spec-  
ulation.

When we turn our eyes to this feature of the human character, we find it peculiarly interesting. Mankind are distinguished from the brutal tribes, and elevated to a higher rank, by the rational and moral faculties with which they are endowed; but they are still more widely distinguished from the inferior creation, and more high-

ly exalted above them, by being made capable of religious notions and religious sentiments. The slightest knowledge of history is sufficient to inform us, that religion has ever had a powerful influence in moulding the sentiments and manners of men. It has sometimes dignified, and sometimes degraded, the human character. In one region or age it has been favourable to civilization and refinement; in another, it has occasionally cramped the genius, depraved the morals, and deformed the manners of men. The varieties of religion are innumerable; and the members of every distinct sect must view all who differ from them as more or less mistaken with respect to the most important concerns of man. Religion seems to be congenial to the heart of man; for wherever human society subsists, there we are certain of finding religious opinions and sentiments.

It must, therefore, be an important subject of speculation to the man and the philosopher to consider the origin of religion, to inquire, How far religion is genuine, and how far it is a mere human invention; and to examine, What particular religion is best calculated to produce a happy influence on human life.

We shall endeavour to give a satisfactory answer to each of these questions, and to show, in the following pages, the considerations which should govern our judgment of the comparative merits of particular religions, and to show, in the following pages, what appear to be true, and to have the greatest influence on human life and manners.

I. The foundation of all religion is the belief of the existence of one or more superior powers, who govern the world, and upon whom the happiness or misery of mankind ultimately depends. It is difficult, as it may be said to have been, to trace the origin of religion, but three sources that can be traced, and which the image of Deity must be stamped on the mind of every human being, the savage as well as the philosopher, the founders of societies, and other eminent persons, tracing by the efforts of their own reason, or by the influence of invisible causes, must have discovered the existence of superior powers, and communicated the discovery to their associates and followers; or, finally, the universal belief in such powers must have been derived by tradition from a primal revelation, communicated to the progenitors of the human race.

One or other of these hypotheses must be true, be it does not cease a fourth cannot be framed. But we have seen, where (*POLYTHEISM*, No 2.) examined the reasoning which has been employed to establish the first, and shown that it proceeds upon false notions of human nature. We should likewise pronounce it contrary to fact, could we believe, on the authority of some of its patrons, who are not ashamed to contradict one another, that the Kamtshatkans, and other tribes, in the lowest state of reasoning and morals, have no ideas whatever of Deity. We proceed, therefore, to consider the second hypothesis, which is much more plausible, and will bear a stricter scrutiny.

That the existence and many of the attributes of the Deity are capable of rigid demonstration, is a truth which cannot be controverted either by the philosopher or the Christian; for "the invisible things of Him from the creation of the world are clearly seen, being understood by the things that are made, even His eternal power and Godhead," (*see METAPHYSICS*, Part III.

Chap.

Religion: Chap. VI. and THEOLOGY, N° 8, 9.) But surely it would be rash to infer, either that every truth for which, when it is known, the ingenuity of man can frame a demonstration, is therefore *discoverable* by human sagacity, or that all the truths which have been discovered by a *Newton* or a *Locke* might therefore have been discovered by untaught barbarians. In mathematical science, there are few demonstrations of easier comprehension than that given by *Euclid*, of the theorem of which *Pythagoras* is the reputed author; yet no man ever dreamed that a boy capable of being made to understand that theorem, must therefore have sagacity equal to the sage of *Samos*; or that such a boy, having never heard of the relation between the hypotenuse and other two sides of a right-angled triangle, would be likely to *discover* that the square of the former is precisely equal to the sum of the squares of the latter. Just so it seems to be with the fundamental truths of theology. There can hardly be conceived a demonstration less intricate, or more conclusive, than that which the man of science employs to prove the existence of at least one God, possessed of boundless power and perfect wisdom. And could we suppose that the human race had remained without any knowledge of God in the world, till some lucky individuals had by some means made themselves masters of the rules of logic, and the philosophy of causes, there can be no doubt that these individuals might have discovered the existence of superior powers, and communicated the discovery to their associates and followers. But this supposition cannot be admitted, as it is contradictory to the evidence of all history. No nation ever existed in which there is not reason to believe that some individuals were entertained of superior and divine powers, upon which depends the happiness of nations as a whole; and from the most authentic records of antiquity, it is apparent that very pure principles of religion prevailed in some nations long before the invention of logic, and the philosophy of causes, were thought of by any people under heaven.

The supposition before us is inadmissible upon other accounts. Some modern philosophers have fancied that the original progenitors of mankind were left entirely to themselves from the moment of their creation; that they wandered about for ages without the use of speech and in the lowest state of savagism; but that they gradually civilized themselves, and at last stumbled upon the contrivance of making articulate sounds significant of ideas, which was followed by the invention of arts and sciences, with all the blessings of religion and legislation in their train. But this is a wild reverie, inconsistent with the phenomena of human nature.

It is a well known fact, that a man blind from his birth, and suddenly made to see, would not by means of his newly acquired sense discern either the magnitude or figure or distance of objects, but would conceive everything which communicated to him visible sensations as inseparably united to his eye or his mind (See *METAPHYSICS*, N° 49—53). How long his sense of sight would remain in such an imperfect state, we cannot positively say; but from attending to the visible sensations of infants, we are confident that weeks, if not months, elapse before they can distinguish one thing from another. We have indeed been told, that *Cheselden's* famous patient, though he was at first in the state which

we have described, learned to distinguish objects by sight in the course of a few hours, or at the most of a few days; but admitting this to a certain extent to be true, it may easily be accounted for. The disease called a *cataract* seldom occasions total blindness; but let us suppose the eyes of this man to have been so completely dimmed as to communicate no sensation whatever upon being exposed to the rays of light; still we must remember that he had long possessed the power of loco-motion and all his other senses in perfection. He was therefore well acquainted with the real, *i. e.* the tangible magnitude, figure, and distance of many objects; and having been often told that the things which he touched would, upon his acquisition of sight, communicate new sensations to his mind, differing from each other according to the distance, figure, and magnitude of the objects by which they were occasioned, he would soon learn to infer the one from the other, and to distinguish near objects by means of his sight.

The progenitors of the human race, however, if left to themselves from the moment of their creation, had not the same advantages. When they first opened their eyes, they had neither moved, nor handled, nor heard, nor smelled, nor tasted, nor had a single idea or notion treasured up in their memories; but were in all these respects in the state of new-born infants. Now we should be glad to be informed by those sages who have conducted mankind through many generations in which they were *mutum et turpe pecus* to that happy period when they invented language, how the first men were taught to distinguish objects by their sense of sight, and how they contrived to *live* till this most necessary faculty was acquired? It does not appear that men are like brutes, provided with a number of instincts which guide them blindfold and without experience to whatever is necessary for their own preservation (see *INSTINCT*): On the contrary, all voyagers tell us that, in strange and uninhabited countries, they dare not venture to taste unknown fruits unless they perceive that these fruits are eaten by the fowls of the air. But without the aid of instinct, or of some other guide equally to be depended upon, it is not in our power to conceive how men dropt from the hands of their Creator, and, left from that instant wholly to themselves, could move a single step without the most imminent danger, or even stretch out their hands to lay hold of that food which we may suppose to have been placed within their reach. They could not, for many days, distinguish a precipice from a plane, a rock from a pit, or a river from the meadows through which it rolled. And in such circumstances, how could they possibly exist, till their sense of sight had acquired such perfection as to be a sufficient guide to all their necessary motions? Can any consistent theist suppose that the God whose goodness is so conspicuously displayed in all his works, would leave his noblest creature on earth, a creature for whose comfort alone many other creatures seem to have been formed, in a situation so forlorn as this, where his immediate destruction appears to be inevitable? No! This supposition cannot be formed, because mankind still exist.

Will it then be said, that when God formed the first But from men, he not only gave them organs of sensation, and an original souls capable of arriving by discipline at the exercise of reason, but that he also impressed upon their minds revelation. adequate

Religion. adequate ideas and notions of every object in which they were interested, brought all their organs, external and internal, at once to their utmost possible state of perfection; taught them instantaneously the laws of reasoning; and, in one word, stored their minds with every branch of useful knowledge? This is indeed our own opinion; and it is perfectly agreeable to what we are taught by the Hebrew lawgiver. When God had formed Adam and Eve, Moses does not say that he left them to acquire by slow degrees the use of their senses and reasoning powers, and to distinguish as they could fruits that were salutary from those that were poisonous. No: he placed them in a garden where every tree but one bore fruit fit for food; he warned them particularly against the fruit of that tree; he brought before them the various animals which roamed through the garden; he arranged these animals into their proper genera and species; and by teaching Adam to give them names, he communicated to the first pair the elements of language. This condescension appears in every respect worthy of perfect benevolence; and indeed without it the helpless man and woman could not have lived one whole week. But it cannot be supposed, that amidst so much useful instruction the gracious Creator would neglect to communicate to his rational creatures the knowledge of himself; to inform them of their own origin, and the relation in which they stood to him; and to state in the plainest terms the duties incumbent on them in return for so much goodness.

10  
The mode of communication not certainly known.

In what manner all this knowledge was communicated, cannot be certainly known. It may have been in either of the following ways conceivable by us, or in others of which we can form no conception. God may have miraculously stored the minds of the first pair with adequate ideas and notions of sensible and intellectual objects; and then by an internal operation of his own Spirit have enabled them to exert at once their rational faculties so as to discover his existence and attributes, together with the relation in which as creatures they stood to him their Almighty Creator. Or, after rendering them capable of distinguishing objects by means of their senses, of comparing their ideas, and understanding a language, he may have exhibited himself under some sensible emblem, and conducted them by degrees from one branch of knowledge to another, as a school-master conducts his pupils, till they were sufficiently acquainted with every thing relating to their own happiness and duty as rational, moral, and religious creatures. In determining the question before us, it is of no importance whether infinite wisdom adopted either of these methods, or some other different from them, both which we cannot conceive. The ordinary process in which men acquire knowledge is, by the laws of their nature, extremely tedious. They cannot reason before their minds be stored with ideas and notions; and they cannot acquire these but through the medium of their senses long exercised on external objects.

11  
But whether internal or external, it was equally a revelation.

The progenitors of the human race, left to inform themselves by this process, must have inevitably perished before they had acquired one distinct notion; and it is the same thing with respect to the origin of religion, whether God preferred them from destruction by an internal or external revelation. If he stored their minds at once with the rudiments of all useful knowledge, and

rendered them capable of exerting their rational faculties, so as, by tracing effects to their causes, to discover his being and attributes, he revealed himself to them as certainly as he did afterwards to Moses, when to him he condescended to speak face to face.

Revelation.

12  
If this reasoning be admitted as fair and conclusive, and we apprehend that the principles on which it proceeds cannot be considered as ill founded, we have advanced so far as to prove that mankind must have been originally enlightened by a revelation. But it is scarce necessary to observe, that this revelation must have been handed down through succeeding generations. It could not fail to reach the era of the deluge. It is not absurd to suppose, that he who spake from heaven to Adam, spake also to Noah. And both the revelation which had been handed down to the postdiluvian patriarch by tradition, and that which was communicated immediately to himself, would be by him made known to his descendants. Thus it appears almost impossible that some part of the religious sentiments of mankind should not have been derived from revelation; and that not of the religious sentiments of one particular family or tribe, but of almost all the nations of the earth.

13  
Such a revelation must naturally be handed to posterity.

This conclusion, which we have deduced by fair reasoning from the benevolence of God and the nature of man, is confirmed by the authority of the Jewish and Christian Scriptures, which are entitled to more implicit credit than all the other records of ancient history.

14  
The authority of the Jewish and Christian Scriptures.

When we review the internal and external evidence of the authenticity of these sacred books, we cannot for a moment hesitate to receive them as the genuine word of God. If we examine their internal character, they everywhere appear to be inspired by the Spirit of Heaven. The creation of the world—the manner in which this globe was first peopled—the deluge which swept away its inhabitants—the succeeding state of the state of mankind in the next ages after the deluge—the calling of Abraham—the legislation of Moses—the whole series of events which befel the Jewish nation—the prophecies—the appearance of Jesus Christ, and the promulgation of his gospel, as explained to us in the Scriptures—form one series, which is, in the highest degree, illustrative of the power, wisdom, and goodness of the Supreme Being.

While it must be allowed that the human mind is ever prone to debase the sublime principles of true religion by enthusiasm and superstition, reason and candour will not for a moment hesitate to acknowledge that the whole system of revelation represents the Supreme Being in the most sublime and amiable light; that, in it, religion appears essentially connected with morality; that the legislative code of Moses was such as no legislator ever formed and established among a people equally rude and uncultivated; that the manners and morals of the Jews, vicious and savage as they may in some instances appear, yet merit a much higher character than those either of their neighbours, or of almost any other nation, whose circumstances and character were in other respects similar to theirs; that there is an infinite difference between the Scripture prophecies and the oracles and predictions which prevailed among heathen nations; and that the miracles recorded in those writings which we esteem sacred, and which, in all circumstances which entitle them to be ranked in a very different

different class from those which enthusiasm and imposture have fabricated among other nations. See MIRACLES AND PROPHECY.

14  
The five books of Moses proved to be divine.

But as the evidence of the divine origin of the primal religion rests particularly on the authority of the first five books of the Old Testament, it may be thought incumbent on us to support our reasoning on this subject, by proving, that the author of those books was indeed inspired by God. This we shall endeavour to do by one decisive argument; for the nature of the article, and the limits prescribed us, admit not of our entering into a minute detail of all that has been written on the divine legation of Moses.

If the miracles recorded in the book of Exodus, and the other writings of the Hebrew lawgiver, were really performed; if the first born of the Egyptians were all cut off in one night, as is there related; and if the children of Israel passed through the Red sea, the waters being divided, and forming a wall on their right hand and on their left—it must necessarily be granted, that Moses was sent by God; because nothing less than a divine power was sufficient to perform such wonderful works. But he who supposes that these works were never performed, must affirm that the books recording them were forged, either at the time when the miracles are said to have been performed, or at some subsequent era: There is no other alternative.

15  
For it was otherwise impossible to impose them on the Jews in the crato which they relate, or

Then, if the books were forged at the era in which the above events are said to have been wrought, a very few talents of forgery would be incontrovertibly evident. These books, however, were written for the use of the Jews, and not for the use of the Egyptians; and, after having inflicted various plagues upon the Egyptians, and brought them, to the number of six hundred thousand, out of Egypt with a high hand; that they were led by a pillar of cloud through the day, and by a pillar of fire through the night, to the brink of the Red sea, where they were almost overtaken by the Egyptians, who had pursued them with chariots and horses; that, to make a way for their escape, Moses stretched out his rod over the sea, which was immediately divided, and permitted them to pass through on dry ground, between two walls of water; and that the Egyptians, pursuing and going in after them to the midst of the sea, were all drowned by the return of the waters to their usual state, as soon as the Hebrews arrived at the further shore. Is it possible now that Moses or any other man could have persuaded 600,000 persons, however barbarous and illiterate we suppose them, that they had been witnesses of all these wonderful works, if no such works had been performed? Could any art or eloquence persuade all the inhabitants of Edinburgh and Leith, that they had yesterday walked on dry ground through the Frith to Kinghorn, the waters being divided and forming a wall on their right hand and on their left? If this question must be answered in the negative, it is absolutely impossible that the books of Moses, supposing them to have been forged, could have been received by the people who were alive when those wonders are said to have been wrought.

16  
in any after period.

Let us now inquire, whether, if they be forgeries, they could have been received as authentic at any subsequent period; and we shall soon find this supposition as impossible as the former. The books claiming Moses for their author speak of themselves as delivered by him, and from his days kept in the ark of the covenant; an

ark which, upon this supposition, had no existence prior to the forgery. They speak of themselves likewise, not only as a history of miracles wrought by their author, but as the statutes or municipal law of the nation, of which a copy was to be always in the possession of the priests, and another in that of the supreme magistrate. Now, in whatever age we suppose these books to have been forged, they could not possibly be received as authentic; because no copy of them could then be found either with the king, with the priests, or in the ark, though, as they contain the statute law of the land, it is not conceivable that, if they had existed, they could have been kept secret. Could any man, at this day, forge a book of statutes for England and Scotland, and make it pass upon these nations for the only book of statutes which they had ever known? Was there ever since the world began a book of statutes, and these, too, multifarious and burdensome, imposed upon any people as the only statutes by which they and their fathers had been governed for ages? Such a forgery is evidently impossible.

But the books of Moses have internal proofs of authenticity, which no other books of ancient statutes ever had. They not only contain the laws, but also give an historical account of their enactment, and the reasons upon which they were founded. Thus they tell us, that the rite of circumcision was instituted as a mark of the covenant between God and the founder of the Jewish nation, and that the practice of it was enforced by the declaration of the Almighty, that every uncircumcised man child should be cut off from his people. They inform us that the annual solemnity of the passover was instituted in commemoration of their deliverance when God slew, in one night, all the first born of the Egyptians; that the first born of Israel, both of man and beast, were on the same occasion dedicated for ever to God, who took the Levites instead of the first born of the men; that this tribe was consecrated as priests, by whose hands alone the sacrifices of the people were to be offered; that it was death for any person of a different tribe to approach the altar, or even to touch the ark of the covenant; and that Aaron's budding rod was kept in the ark in memory of the wonderful destruction of Korah, Dathan, and Abiram, for their rebellion against the priesthood.

Is it possible now, if all these things had not been practised among the Hebrews from the era of Moses, with a retrospect to the signal mercies which they are said to commemorate, that any man or body of men could have persuaded a whole nation, by means of forged books, that they had always religiously observed such institutions? Could it have been possible, at any period posterior to the Exodus, to persuade the Israelites that they and their fathers had all been circumcised on the eighth day from their birth, if they had been conscious themselves that they had never been circumcised at all? or that the passover was kept in memory of their deliverance from Egyptian bondage, if no such festival was known among them?

But let us suppose that circumcision had been practised, and all their other rites and ceremonies observed from time immemorial, without their knowing any reason of such institutions; still it must be confessed that the forger of these books, if they were forged, constructed his narrative in such a manner as that no man

Religion. of common sense could receive it as authentic. He says it was death to touch the ark! As such an assertion was never heard of before, and as the ritual he was endeavouring to make them esteem sacred was oppressively multifarious; surely some daring spirit would have ventured to put his veracity to the test by moving the ark and even offering sacrifices; and such a test would at once have exposed the imposture. The budding rod, too, and the pot of manna, which, though long preserved, were never before heard of, must have produced inquiries that could not fail to end in detection. These books speak likewise of weekly sabbaths, daily sacrifices, a yearly expiation, and monthly festivals, all to be kept in remembrance of great things particularly specified as done for the nation at an early period of its existence. If this was not the case, could the forger of the books have persuaded the people that it really was so? The enlightened reasoners of this nation would be offended were we to compare them with the ancient Israelites; but surely they will not say that we are partial to that people, if we bring them to a level with the most savage tribes of the Russian empire, who profess Christianity? Now, were a book to be forged containing an account of many strange things done a thousand years ago in Siberia by an *Apollonius*, or any other philosopher or hero, numbers of the barbarians inhabiting that country would, we doubt not, give implicit credit to the legend: But were the author, in confirmation of his narrative, to affirm, that all the Siberians had from that day to this kept sacred the first day of the week in memory of his hero; that they had all been baptized or circumcised in his name; that in their public judicatories they had sworn by his name, and upon that very book which they had never seen before; and that the very same book was their law and their gospel, by which for a thousand years back the actions of the whole people had been regulated—surely the grossest savagery among them would reject with contempt and indignation a forgery so palpable.

If this reasoning be conclusive, the books of Moses must indubitably be authentic, and he himself must have been inspired by the spirit of God. But this point being established, the question respecting the origin of the primeval religion is completely answered. The writer of the book of Genesis informs us, that Adam and Noah received many revelations from the Author of their being, and that their religion was founded on the principles of the purest theism. How it degenerated among the greater part of their descendants into the grossest idolatry, has been shown at large in another place. See POLYTHEISM.

17  
Of the influence of religion on society.

II. Having thus answered the first question proposed for discussion in the present article, we now proceed to consider the second, and to inquire whether and how far religious sentiments have a tendency to injure or to promote the welfare of society? This is a subject of the utmost importance; and if we prove successful in our inquiries, we shall be enabled to determine whether the governors of mankind ought carefully to support religious establishments, or whether the philosopher who calls himself a citizen of the world, and professes to feel the most eager desire to promote the interests of his species, acts consistently when he labours to exterminate religion from among men.

• M. Necker. A celebrated French financier, a man of abilities

and virtue, who has published a book on the importance of religious opinions, labours to show that religious establishments are indispensably necessary for the maintenance of civil order, and demonstrates how weak the influence of political institutions is on the morals of mankind; but he refuses to review the history of past ages in order to discover how far religious opinions have actually been injurious or beneficial to the welfare of society; choosing rather to content himself with the result of a series of metaphysical disquisitions.

We admire the spirit which induced a man who had spent a considerable part of his life amid the hurry of public business, to become the strenuous advocate of religion; but we cannot help thinking that, notwithstanding the eloquence, the acuteness, and the knowledge of mankind which he has displayed, his refusing to admit the evidence of facts concerning the influence of religion on society, may possibly be regarded by its enemies as a tacit acknowledgment that the evidence of facts would be unfavourable to the cause which he wishes to defend. The fallacy of general reasoning, and the inutilty of metaphysics for the purposes of life, are so universally acknowledged, that they have long been the theme of declamation. The progress of religion, as well as the abuses of religion, have been the subject of the principles of the human mind, and the application of the gifts of nature to the human mind, produced effects hurtful to the human mind, and to the interests of mankind; yet after tracing the progress of religion, we cannot, for a moment, be so foolish as to think that the primary tendency of religion is hostile to the interests of society, or that it is necessary to show it abstractly in order that it may be shown in an odious light. Often has the character of religion been with artful malice; but the character of religion has been so skilfully directed as to show its utility, and to exclude the absurdity of the doctrine of polytheism, and afterwards laboured to prove that the system of polytheism is more destructive to the interests of society than the purest and most sublime theism: instances in which the abuse of religion had tended to deprave the human heart, and had led to the most shocking crimes, have been abundantly collected, and displayed in all the aggravating colours in which eloquence could array them, till at length even the friends of true religion have been shocked; and it has become a fashionable opinion, that nothing but selfishness or bigotry can prompt men to represent religion as the friend of civil order. But let us try if, by a candid consideration of what effects have resulted to society from religious principles, in general, without comparing these with regard to truth or falsehood, we can advance any thing to vindicate the character of religion.

Notions of Deity in general, of various orders of divinities, of their moral character, of their influence on human life, of a future state, and of the immortality of the human soul, constitute the leading articles of religion. Let us view these, together with the rites to which they have given rise; and we may perhaps be enabled to form some well-grounded notions on this important point.

I. Having proved that the first religious principles entertained by men were derived from revelation, it is impossible to suppose that they could produce effects in-

Religion.

18  
Triumphs of the sceptic on account of the abuses of religion.

19  
The first religious opinions entertained by men could not possibly be injurious to society.

injurious to society. If religion of any kind has ever lessened the virtue or disturbed the peace of men, it must have been that religion which springs from a belief in a multitude of superior powers actuated by passions, and of whom some were conceived as benevolent and others as malicious beings. That such sentiments should have produced vices unknown in societies where pure theism is professed, will be readily admitted. Even the few *atheists* who live in Christian or Mahometan countries are restrained by the laws, by a desire to promote the honour of the sect, and by many other considerations, from indulging in practices which the example of the false gods of antiquity sanctioned in their votaries. But in determining the present question, we must not compare the virtues of the Pagan world with those of individual atheists in modern Europe, but with those of nations professing atheism; and such nations are nowhere to be found. We can however easily conceive, that in a society governed by any notions of God or of a future state, no such being would be erected as those which persons of the lowest capacities, of which the criminal indolence and ignorance of the greatest stigmas on the Pagan world afford examples. In such societies, therefore, the gods are worshipped with a piety which is not only sanctioned by the religious sanction; and which is attended with the vigilance of human laws, but which is attended with horror. Conscience, which is the voice of the moral sense, would not be able to resist the influence of the laws of morality: the social order would be no longer disturbed, and the midnight assassin would everywhere be punished. The general scramble mankind would be at an end.

20  
The effect of atheism on the manners of nations,

21  
would be more significant than that of the most absurd Paganism.

It is not only in the worship of evil spirits that we find a more shocking than in the worship of deities, who are supposed to be all-benevolent, are treated with reverence and awe. It is in the influence of such different sentiments on the moral practice of the human race, that we naturally find the cause of the difference between the Pagan and the Christian world. The Pagan world, by its worship of evil spirits, appears to have produced such effects on the morality of the savages by whom they were entertained. The benevolent deities were neglected, and the malevolent deities were necessary to a robbery for their merits, a grateful return: a designed injury, provokes resentment. But when you become, by accident, the instrument of any man's good fortune, the world will scarce consider him as owing you any obligation: the stone which bruises your foot excites only a momentary emotion of resentment. Those gods who would not avoid doing good to men might not receive a profusion of thanks for their services; and yet a favour conferred by a human benefactor commands the warmest gratitude. But those rude tribes appear to have had so much wisdom as to confer a less absolute malice on their malevolent deities, than the benevolence which they attributed to their more amiable order of superior beings: though the latter could not possibly do them any thing but good, and that constantly; yet the former were not under an equally indispensable necessity of

persevering in depressing them under calamities. On their malevolent deities they conferred a freedom of agency which they denied to the benevolent. No wonder, then, that they were more assiduous in paying their court to the one than to the other. They might with as much propriety have thought of being grateful to the boar or stag whose flesh supported them, as to deities who were always benevolent, because they could not possibly be otherwise. Though negligent of such deities, this can scarce be thought to have had any tendency to render them ungrateful to benefactors like themselves. And yet, it must not be dissembled, that the American Indians, among whom such religious sentiments have been found to prevail, are said to be very little sensible to the emotions of gratitude. An Indian receives a present without thinking of making any grateful acknowledgments to the bestower. He pleases his fancy or gratifies his appetite with what you have given, without seeming to consider himself as under the smallest obligation to you for the gift.

It may be doubted, however, whether this spirit of ingratitude originates from, or is only collateral with, that indifference which refuses adoration and worship to the benevolent divinities. If the former be actually the case, we must acknowledge that those religious notions which we now consider, though preferable to general atheism, are in this respect unfriendly to virtue. But if the Indians may be thought to owe the ingratitude for which they are distinguished to the opinion which they entertain of the existence of a benevolent order of deities, whose benevolence is necessary and involuntary, their ideas of the nature of their malevolent demons do not appear to have produced equal effects on their moral sentiments. However submissive to those dreaded beings, they are far from showing the same tame and cowardly submission to their human enemies: towards them they seem rather to adopt the sentiments of their demons. Inveterate rancour and brutal fury, inhuman cruelty and inconceivable cunning, are displayed in the hostilities of tribes at war; and we know not, after all, if even these sentiments do not owe somewhat of their force to the influence of religion.

Yet let us remember that these same Indians have not been always represented in so unamiable a light; or, at least, other qualities have been ascribed to them which seem to be inconsistent with those barbarous dispositions. They have been described as peculiarly susceptible of conjugal and parental love; and he who is so cannot be destitute of virtue.

22  
But leaving the religion of savages, of which very little is known with certainty, let us proceed to examine what is the natural influence of that mixed system of theology which represents to the imagination of men a number of superior and inferior divinities, actuated by the same passions and feelings with themselves, and often making use of their superior power and knowledge for no other purpose but to enable them to violate the laws of moral order with impunity. This is the celebrated polytheism of the Greeks and Romans, and most other nations of antiquity (see POLYTHEISM). Could its influence be favourable to virtue?

At a first view every person will readily declare, that apparently such a system must have been friendly to profligacy. If friendly to you commit the government of the universe, and the inspection of human society, to a set of beings who are often

The influence of Greek and Roman polytheism,

Religion. often disposed to regard vice with a no less favourable eye than virtue, and who, though there be an established order by which virtue is discriminated from vice, and right from wrong, yet scruple not to violate that order in their own conduct; you cannot expect them to require in you a degree of rectitude of which they themselves appear incapable. A Mercury will not discourage the thievish arts of the trader; a Bacchus and a Venus cannot frown upon debauchery; Mars will behold with savage delight all the cruelties of war. The Thracians indeed, one of the most barbarous nations of antiquity, whose ferocity was little if at all inferior to that of the Indians who have been distinguished as cannibals, was the favourite nation of Mars; among whom stood his palace, to which he repaired when about to mount his chariot, and arm himself for battle. Even Jupiter, who had been guilty of so many acts of tyrannical caprice, had been engaged in such a multitude of amorous intrigues, and seemed to owe his elevated station as monarch of the sky, not to superior goodness or wisdom, but merely to a superior degree of brutal force, could not be feared as the avenger of crimes, or revered as the impartial rewarder of virtues.

21  
But when  
contrasted  
with a-  
theism its  
effects were  
favourable.

That this system had a pernicious effect on morals, and that, as compared with pure theism, it was injurious to society, cannot be denied; but yet, when contrasted with atheism, it was not without its favourable effects. It was so connected with the order of society, that, without its support, that order could scarce have been maintained. The young rake might perhaps justify himself by the example of Jupiter, or Apollo, or some other amorous divinity; the frail virgin or matron might complain of Cupid, or boast of imitating Venus; and the thief might practise his craft under the patronage of Mercury: But if we take the whole system together, if we consider with what views those deities were publicly worshipped, what temples were raised, what rites instituted, what sacrifices offered, and what *fires* consecrated; we shall perhaps find it necessary to acknowledge that the general effects even of that mixed and incoherent system of polytheism which prevailed among the Greeks and Romans were favourable to society. To state a particular instance; the *ancilia* of Mars and the fire of Vesta were thought to secure the perpetuity of the Roman empire. As long as the sacred *ancilia*, which had been dropped from heaven for that benevolent purpose, was safely preserved in those holy archives in which it had been deposited; and as long as the sacred fire of Vesta was kept burning, without being once extinguished, or at least suffered to remain for an instant in that state; so long was Rome to subsist and flourish. And, however simple and absurd the idea which connected the prosperity of a nation with the preservation of a piece of wood in a certain place, or with the constant blazing of a flame upon a hearth; yet no fact can be more certain, than that the patriotism and enthusiastic valour of the Romans, which we so much extol and admire, were, in many instances, owing in no inconsiderable degree to the veneration which they entertained for the *ancilia* and the vestal fire.

22  
As is proved  
by a  
numerous  
series of  
facts, &c.

A numerous series of facts occur in the Roman history, which show the happy effects of their religious opinions and ceremonies on their sentiments concerning social order and the public welfare. How powerful

was the influence of the *sacramentum* administered to the soldiers when they enlisted in the service of their country! The promises made, the idea of the powers invoked, and the rites performed on that occasion, produced so deep and so awful an impression on their minds, that no danger, nor distress, nor discontent, could prompt them to violate their engagements. The responses of the oracles, too, though the dictates of deceit and imposture, were often of singular service to those to whom they were uttered; when they inspired the warrior, as he marched out to battle, with the confidence of success, they communicated to him new vigour, and more heroic valour, by which he was actually enabled to gain, or at least to deserve, the success which they promised. Again, When in times of public distress, the augur and the priest directed some games to be celebrated, certain sacrifices to be offered, or some other solemnities to be performed, in order to appease the wrath of the offended deities; it is plain that the means were not at all suited to accomplish the end proposed by them; yet still they were highly beneficial. When the attention of the whole people was turned entirely to those solemnities, the wrath of heaven was to be averted, and the public distress or danger might be removed. The public union was cemented, and the hopes of the people were raised; and when persuaded, that by these means the cause of their distress had been removed, they took more direct and proper measures for the relief of the state.

Could we view the ancient system of religion, as it was in public or in private life, as it was in the progress of that system of superstition which prevailed among the Romans, could we perceive how much it contributed to the maintenance of civil order; could we see the effect of the *ancilia* and the *fires* of Vesta, as they were maintained, and the hopes of the people were raised, and when persuaded, that by these means the cause of their distress had been removed, they took more direct and proper measures for the relief of the state.

Could we view the ancient system of religion, as it was in public or in private life, as it was in the progress of that system of superstition which prevailed among the Romans, could we perceive how much it contributed to the maintenance of civil order; could we see the effect of the *ancilia* and the *fires* of Vesta, as they were maintained, and the hopes of the people were raised, and when persuaded, that by these means the cause of their distress had been removed, they took more direct and proper measures for the relief of the state.

23  
The ideas which prevailed among the nations of the heathen world concerning a future state of retribution were, it must be confessed, not very correct. Some of the poets, we believe, have represented them in no unfair light; both Homer and Virgil have conducted their heroes through the realms of Pluto, and have taken occasion to unfold to us the secrets of those dreary abodes. The scenes are wild and fanciful; the rewards of the just and virtuous are of no very refined or dignified nature; and of the punishments inflicted on the guilty, it is often hard to say for what ends they could be inflicted; whether to correct and improve, or for the gratification of revenge or whim: they are often so whimsical and unsuitable, that they cannot with any degree of propriety be ascribed to any cause but blind chance or wanton caprice. A great dog with three tongues, a peevish old boatman with a leaky ferry-boat, demanding

**Religion.** manding his freight in a surly tone, and an uxorious monarch, are objects too familiar and ludicrous not to degrade the dignity of those awful scenes which are represented as the mansions of the dead, and to prevent them from making a deep enough impression on the imagination. The actions and qualities, too, for which departed spirits were admitted into Elysium, or doomed to the regions of suffering, were not always of such a nature as under a well regulated government on earth would have been thought to merit reward, or to be worthy of punishment. It was not always virtue or wisdom which conducted to the Elysian fields, or gained admission into the society of the immortal gods.

Ganymede was for a very different reason promoted to be the cup-bearer of Jove; and Hercules and Bacchus could not surely plead that any merits of that kind entitled them to seats in the councils and at the banquets of the immortals. That doctrine, likewise, which represented mortals as hurried by fate to the commission of crimes, which they could no more obtain from committing than the furies could from obeying the impulse of a powerful passion, was not placing it into the breast of an immortal, who could not but produce effects, but it was placing it into the breast of a mortal, and it afforded a ready excuse for the most heinous crimes.

26 but nevertheless favourable to virtue and moral order. **Religion.** considers the ideas of the gods concerning the moral government of the universe, and a future state of rewards and punishments. It is generally acknowledged, that their ideas have been favourable to virtue and morality, and that they have been incorrect and absurd in many particulars. Still they represent punishments as due to such qualities and actions as were injurious to the moral government of the world, and for those qualities which are necessary to the moral government of the world, they hold out a prospect of reward. Though incorrect, their ideas concerning the gods were exceedingly distinct; they were not general, but such as might be readily conceived by the imagination, in all their circumstances, as really existing. When a man is told that for such a deed he will be put to death, he may shudder and be alarmed, and think of the deed as what he must by no means commit; but place before him the scene and the apparatus for his execution, tell him to behold some other criminal mounting the scaffold, addressing his last words in a wild scream of despair to the surounding spectators, and then launching into eternity—his horror of the crime, and his dread of the punishment, will now be much more powerfully excited. In the same manner, to encourage the soldier marching out to battle, or the mariner setting sail under the prospect of a storm, promise not, merely in general terms, a liberal reward; be sure to specify the nature of the reward which you mean to bestow; describe it so as that it may take hold on the imagination, and may rise in opposition to the images of death and danger with which his courage is to be assailed.

If these phenomena of the human mind are fairly stated, if it be true that general ideas produce no very powerful effects on the sentiments and dispositions of the human heart, it must then be granted, that though the scenes of future reward and punishment, which the heathens considered as prepared for the righteous and the wicked, were of a somewhat motley complexion; yet still as they were distinct and even minute draughts,

they must have been favourable to virtue, and contributed in no inconsiderable degree to the support of civil order. **Religion.**

27 Another thing of which we may take notice under this head, is the vast multiplicity of deities with which the Greek and Roman mythology peopled all the regions of nature. Flocks and fields, and woods and oaks, and flowers, and many much more minute objects, had all their guardian deities. These were somewhat capricious at times, it is true, and expected to have at- tention paid them: But yet the faithful shepherd, and the industrious farmer, knew generally how to acquire their friendship; and in the idea of deities enjoying the same simple pleasures, partaking in the same labours, protecting their possessions, and bringing forward the fruits of the year, there could not but be something of a very pleasing nature, highly favourable to industry, which would animate the labours, and cheer the festival, of the good people who entertained such a notion; nay, would diffuse a new charm over all the scenes of the country, even in the gayest months of the year.

From all of these particular observations, we think ourselves warranted to conclude, that notwithstanding the mixed characters of the deities who were adored by the celebrated nations of antiquity; though they are in many instances represented as conspicuous for vices and frolics; however vain, absurd, and morally criminal, some of the rites by which they were worshipped may have been, and however incorrect the notions of the heathens concerning the moral government of the universe and a future state of retribution; yet still, after making a just allowance for all these imperfections, the general influence of their religious system was rather favourable than unfavourable to virtue and to the order and happiness of society.

28 It was not without good reason that the earliest legislators generally endeavoured to establish their laws and constitutions on the basis of religion; government needs the support of opinion; the governed must be impressed with a belief that the particular establishment to which they are required to submit, is the best calculated for their security and happiness, or is supported on some such solid foundation, that it must prove impossible for them to overturn it, or is connected with some awful sanction, which it would be the most heinous impiety to oppose. Of these several notions, the last will ever operate on most men with the most steady influence. We are frequently blind to our own interest; even when eager for the attainment of happiness, we often refuse to take the wisest measures for that end. The great bulk of the people in every community are so little capable of reasoning and foresight, that the public minister who shall most steadily direct his views to the public good will often be the most unpopular. Those laws, and that system of government, which are the most beneficial, will often excite the strongest popular discontents. Again, it is not always easy to persuade people that your power is superior to theirs, when it is not really so. No one man will ever be able to persuade a thousand that he is stronger than they all together: and therefore, in order to persuade one part of his subjects or army that it is absolutely necessary for them to submit to him, because any attempts to resist his power would prove ineffectual, a monarch or general must take care first to persuade another part that it is for their in- terest

**Religion.** tereft to fubmit to him; or to impreſs the whole with a belief that, weak and pitiful as he himſelf may appear, when viewed ſingly in oppoſition to them all, yet by the aſſiſtance of ſome awful inviſible beings, his friends and protectors, he is ſo powerful, that any attempts to reſiſt his authority muſt prove preſumptuous folly. Here, then, the aid of religion becomes requiſite. Religious ſentiments are the moſt happily calculated, to ſerve this purpoſe. Scarce ever was there a ſociety formed, a mode of government eſtabliſhed, or a code of laws framed and enacted, without having the religious ſentiments of mankind, their notions of the exiſtence of ſuperior inviſible beings, and their hopes and fears from thoſe beings, as its fundamental principle. Now, we believe, it is almoſt univerſally agreed, that even the rudeſt form of ſociety is more favourable to the happineſs of mankind, and the dignity of the human character, than a ſolitary and ſavage ſtate. And if this, with what we have aſſerted concerning religion as the baſis of civil government, be both granted, it will follow, that even the moſt imperfect religious notions, the moſt fooliſh and abſurd rites, and the wildeſt ideas that have been entertained concerning the moral government of the univerſe by ſuperior beings, and a future ſtate of retribution, have been more advantageous than atheiſm to the happineſs and virtue of human life. We have already granted, nor can it be denied, indeed, that many of the religious opinions which prevailed among the ancient heathens, did contribute, in ſome degree, to the depravation of their morals: and all that we argue for is, that on a comparative view of the evil and the good, which reſulted from them, the latter muſt appear more than adequate to counterbalance the effects of the former.

19  
The infinite advantage of a pure, rational, and true religion.

But if ſuch be the natural tendency of thoſe principles by which the human heart is made ſuſceptible of religious ſentiments, that even enthuſiaſm and abſurd ſuperſtition are productive of beneficial effects more than ſufficient to counterbalance whatever is malignant in their influence on ſociety—ſurely a pure rational religion, the doctrines of which are founded in undeniable truth, and all the obſervances which it enjoins, calculated to promote by their direct and immediate effects ſome uſeful purpoſes, muſt be in a very high degree conducive to the dignity and the happineſs of human nature. Indeed one collateral proof of the truth of any religion, which muſt have very conſiderable weight with all who are not of opinion that the ſyſtem of the univerſe has been produced and hitherto maintained in order and exiſtence by blind chance, will be its having a ſtronger and more direct tendency than others to promote the intereſts of moral virtue and the happineſs of mankind in the preſent life. Even the testimony of thouſands, even miracles, prophecies, and the ſanction of remote antiquity, will ſcarce have ſufficient weight to perſuade us, that a religion is of divine origin, if its general tendency appear to be rather unfavourable than advantageous to moral virtue.

30  
Comparative view of the effects of different religious ſystems.

III. We ſhall therefore, in the next place, endeavour to determine, from a comparative view of the effects produced on the character and circumſtances of ſociety by the moſt eminent of theſe various ſystems of religion which have been in different ages or in different countries eſtabliſhed in the world, how far any one of them has in this reſpect the advantage over the reſt; and, if the utility of a ſyſtem of religion were to

be received as a teſt of its truth, what particular ſyſtem might, with the beſt reaſon, be received as true, while the reſt were rejected.

1ſt, The principle upon which we here ſet out is, that all, or almoſt all, ſystems of religion with which we are acquainted, whether true or falſe, contribute more or leſs to the welfare of ſociety. But as one field is more fruitful, and one garden leſs overgrown with weeds than another; ſo, in the ſame manner, one ſyſtem of religious opinions and ceremonies may be more happily calculated than others to promote the trueſt intereſts of mankind. In oppoſition to thoſe philoſophers who are ſo vehement in their declamations againſt the inequality of ranks, we have ever been of opinion, that refinement and civilization contribute to the happineſs of human life. The character of the ſolitary ſavage is, we are told, more dignified and reſpectable than that of the philoſopher and the hero, in proportion as he is more independent. He is indeed more independent; but his independence is that of a ſtone, which receives no nourishment from the earth or air, and communicates none to animals or vegetables around it. In point of happineſs, and in point of reſpectability, we muſt be ſatisfied to let philoſophers ſay what they will, and let the rudeſt ſavages, the laſt, or quiereſt, of the heathens and the ſympathies of ſocial life, ſpeak for themſelves. In the wild foreſts of the weſtern world, and there, ſer civilization to barbariſm, we muſt be ſatisfied to let this view Chriſtianity has the advantage over every other religious ſyſtem which has in any age or country prevailed among men; for nowhere has civilization and uſeful ſcience been carried to ſuch a height as among Chriſtians.

It is not, indeed, in any conſiderable degree, that the View of the various religious notions of the Pagan nations. abſurd ſuperſtitions of thoſe rude tribes be ſaid to be formed into any regular ſyſtem, or to contribute to their happineſs. Among theſe the faculty of reaſon is but in a very low ſtate; and the principle uſually follows the improvement or the depravation of the reaſoning faculty. Their appetites and animal paſſions are almoſt their only principles of action: their firſt religious notions, if we ſuppoſe them not to be derived from revelation or tradition, are produced by the operation of gratitude, or grief, or hope, or fear, upon their imaginations. And to theſe, however wild and fanciful, it is not improbable that they may owe ſome of their earlieſt moral notions. The idea of ſuperior powers naturally leads to the thought that thoſe powers have ſome influence on human life. From this they will moſt probably proceed to fancy one ſet of actions agreeable, another offensive, to thoſe beings to whom they believe themſelves ſubject. And this, perhaps, is the firſt diſtinction that ſavages can be ſuppoſed to form between actions, as right or wrong, to be performed or to be avoided. But if this be the caſe, we muſt acknowledge that the religious notions of the ſavage, however abſurd, contribute to elevate his character, and to improve his happineſs, when they call forth the moral principle implanted in his breaſt.

But if this ſocial ſtate be preferable to a ſtate of wild and ſolitary independence, even the rude ſuperſtitions of unenlightened tribes of ſavages are in another reſpect beneficial to thoſe among whom they prevail. They uſually

usually forms, as has been already observed under this article, the basis of civil order. Religious opinions may lead the great body of the community to reverence some particular set of institutions, some individual, or some family, which are represented to them as peculiarly connected with the gods whom they adore. Under this sanction some form of government is established; they are taught to perform social duties, and rendered capable of social enjoyments. Not only Numa and Lycurgus, but almost every legislator who has sought to civilize a rude people, and reduce them under the restraints of legal government, have endeavoured to impress their people with an idea that they acted with the approbation, and under the immediate direction, of superior powers. We cannot but allow that the rude superstitions of early ages are productive of these advantages to society; but we have already acknowledged, and it cannot be denied, that they are also attended with many unhappy effects. When we view the absurdities introduced with the systems of religion which prevailed among most of the nations of antiquity, we cannot but acknowledge that so noble a principle of human nature as religious sentiments should be liable to such gross perversion; and when we view the effects which they produced on the morals of mankind, and the state of society, though we allow them to have been upon the whole rather beneficial than hurtful, we cannot but observe, that their unfavourable effects are by far more numerous than if they had been better directed. What unhappy effects, for instance, have been produced by false notions concerning the condition of human souls in a future state. Various nations have imagined that the scenes and objects of the world of spirits are only a shadowy representation of the things of the present world. Not only the souls of men, according to the notion, inhabit those regions; all animals, birds, and vegetables, and even inanimate bodies, that are killed or destroyed here, are supposed to pass into that visionary world; and, existing there in various forms, to execute the same functions, or serve the same purposes, as on earth. Such are the ideas of futurity that were entertained by the inhabitants of Guinea. And by these ideas they were induced, when a king or great man died among them, to provide for his comfortable accommodation in the world of spirits, by burying with him meat and drink for his subsistence, slaves to attend and serve him, and wives with whom he might still enjoy the pleasures of love. His faithful subjects vied with each other in offering one a servant, another a wife, a third a son or daughter, to be sent to the other world in company with the monarch, that they might there be employed in his service. In New Spain, in the island of Java, in the kingdom of Benin, and among the inhabitants of Indostan, similar practices on the same occasion, owing no doubt to similar notions of futurity, have been prevalent. But such practices as these cannot be viewed with greater contempt on account of the opinions which have given rise to them, than horror on account of their unhappy effects on the condition of those among whom they prevail. A lively impression of the enjoyments to be obtained in a future state, together with some very false or incorrect notions concerning the qualities or actions which were to entitle the departing soul to admission into the scene of those enjoy-

ments, is said to have produced equally unhappy effects among the Japanese. They not only bribed their priests to solicit for them; but looking upon the enjoyments of the present life with disgust or contempt, they used to dash themselves from precipices, or cut their throats, in order to get to paradise as soon as possible. Various other superstitious subsisting among rude nations might here be enumerated, as instances of the perversion of the religious principles of the human heart, which render them injurious to virtue and happiness. The austerities which have been practised, chiefly among rude nations, as means of propitiating superior powers, are especially worthy of notice.—When the favourite idol of the Baniyas is carried in solemn procession, some devotees prostrate themselves on the ground, that the chariot in which the idol is carried may run over them; others with equal enthusiasm, dash themselves on spikes fastened on purpose to the car. Innumerable are the ways of torture which have been invented and practised on themselves by men ignorantly striving to recommend themselves to the favour of heaven. These we lament as instances in which religious sentiments have been so ill directed by the influence of imagination, and unenlightened erring reason, as to produce unfavourable effects on the human character, and oppose the happiness of social life.—Though we have argued, that even the most absurd systems of religion that have prevailed in the world, have been upon the whole rather beneficial than injurious to the dignity and happiness of human nature; yet if it shall not appear, as we proceed farther in our comparative view of the effects of religion on society, that others have been attended with happier effects than these superstitions which belong to the rude ages of society, we may scarce venture to brand the infidel with the appellation of fool, for refusing to give his assent to religious doctrines, or to act under their influence.

2d, The polytheism of the Greeks and Romans, and other heathen nations in a similar state of civilization, we have already considered as being, upon the whole, rather favourable than unfavourable to virtue; but we must not partially conceal its defects. The vicious characters of the deities which they worshipped, the incorrect notions which they entertained concerning the moral government of the universe and a future retribution, the absurdity of their rites and ceremonies, and the criminal practices which were intermixed with them, must have altogether had a tendency to pervert both the reasoning and the moral principles of the human mind. The debaucheries of the monarch of the gods, and the fidelity with which his example in that respect was followed by the whole crowd of the inferior deities, did, we know, dispose the devout heathen, when he felt the same passions which had asserted their power over the gods, to gratify them without scruple. It is a truth, however, and we will not attempt to deny or conceal it, that the genius of the polytheism of the Greeks and Romans was friendly to the arts; to such of them especially as are raised to excellence by the vigorous exertion of a fine imagination; music, poetry, sculpture, architecture, and painting, all of these arts appear to have been considerably indebted for that perfection to which they attained, especially among the Greeks, to the splendid and fanciful system of mythology which was received among that ingenious people.—

But

**Religion.** But we cannot give an equally favourable account of its influence on the sciences. There was little in that system that could contribute to call forth reason. We may grant indeed, that if reason can be so shocked with absurdity as to be roused to a more vigorous exertion of her powers, and a more determined assertion of her rights in consequence of surveying it; in that case this system of mythology might be favourable to the exercise and improvement of reason; not otherwise.

The connexion of Paganism with morality was too imperfect for it to produce any very important effects on the morals of its votaries. Sacrifices and prayers, and temples and festivals, not purity of heart and integrity of life, were the means prescribed for propitiating the favour of the deities adored by the Pagans. There were other means, too, besides true heroism and patriotism, of gaining admission into the Elysian fields, or obtaining a seat in the council of the gods. Xenophon, in one of the most beautiful parts of his *Memoirs of Socrates*, represents Hercules wooed by Virtue and Pleasure in two fair female forms, and deliberating with much anxiety which of the two he should prefer. But this is the fiction of a philosopher desirous to improve the fables of antiquity in such a way as to render them truly useful. Hercules does not appear, from the tales which are told us of his adventures, to have been at any such pains in choosing his way of life. He was received into the palace of Jove, without having occasion to plead that he had through life been the faithful follower of that goddess to whom the philosopher makes him give the preference; his being the son of Jove, and his wild adventures, were sufficient without any other merits to gain him that honour. The same may be said concerning many of the other demi-gods and heroes who were advanced to heaven, or conveyed to the blissful fields of Elysium. And whatever might be the good effects of the religion of Greece and Rome in general upon the civil and political establishments, and in some few instances on the manners of the people, yet still it must be acknowledged to have been but ill calculated to impress the heart with such principles as might in all circumstances direct to a firm, uniform tenor of virtuous conduct.

But after what has been said on the character of this religion elsewhere (see POLYTHEISM), and in the second part of this article, we cannot without repetition enlarge farther on it here. Of the Jewish religion, however, we have as yet said little, having on purpose reserved to this place whatever we mean to introduce under the article, concerning its influence on society.

3d, When we take a general view of the circumstances in which the Jewish religion was established, the effects which it produced on the character and fortune of the nation, the rites and ceremonies which it enjoined, and the singular political institutions to which it gave a sanction, it may perhaps appear hard to determine, whether it were upon the whole more or less beneficial to society than the polytheism of the Egyptians, Greeks, and Romans. But if such be the judgement which preconceived prejudices, or a hasty and careless view, have induced some to form of this celebrated system; there are others who, with equal keenness, and sounder reasoning, maintain, that it was happily calculated, not only to exemplify the great design of

preparing the way for the promulgation of the Gospel, but likewise to render the Jews a more refined and virtuous people, and a better regulated community, than any neighbouring nation. In the first place, the attributes of the Deity were very clearly exhibited to the Jews in the establishment of their religion. The miracles by which he delivered them from servitude, and conducted them out of Egypt, were striking demonstrations of his power; that condescension with which he forgave their repeated acts of perverseness and rebellion, was a most convincing proof of his benevolence; and the impartiality with which the observance and the violation of his laws were rewarded and punished, even in the present life, might well convince them of his justice. A part of the laws which he dictated to Moses are of eternal and universal obligation; others of them were local and particular, suited to the character of the Jews, and their circumstances in the land of Canaan. The Jewish code, taken altogether, is not to be considered as a complete system of legislation, or laws calculated for all countries and all ages of mankind. When we consider the way in which the Jews were first taken care not to overlook the laws which were said to have been revealed to them, and the circumstances in which they were obliged to observe the customs and manners of the nations with whom they had intercourse with the most scrupulous and exact manner in which they were to observe the precepts and commandments by extirpating the idols and images which they were to hold sacred, and the worship of Baal and the adjacent countries, together with the difficulty of restraining a people so little civilized and cultivated from the idolatrous worship which prevailed among their neighbours: All these circumstances were certainly to be taken into account; and had the laws of the Jews not attended to them, the system which we have remained in force only for a short period, and could they have produced any lasting effect on the character of the nation. With a due attention to these circumstances, let us descend to an examination of particulars.

Although in every religion or superstition that was The Sabbath prevailed through the world, we find one part of its institutions to consist in the enjoining of certain festivals to be celebrated by relaxation from labour, and the performance of certain ceremonies in honour of the gods; yet in none, or almost none besides the Jewish, do we find every seventh day ordained to be regularly kept holy. One great end which the legislator of the Jews had in view in the institution of the Sabbath was, to impress them with a belief that God was the maker of the universe. In the early ages of the world a great part of mankind imagined the stars, the sun, the moon, and the other planets, to be eternal, and consequently objects highly worthy of adoration. To convince the Israelites of the absurdity of this belief, and prevent them from adopting that idolatry, Moses taught them, that those conspicuous objects which the Gentile nations regarded as eternal, and endued with divine power and intelligence, were created by the hand of God; who, after bringing all things out of nothing, and giving them form, order, and harmony, in the space of six days, rested on the seventh from all his works. Various passages in the Old Testament concur to show, that this was one great end of the institution of the Sabbath.

**Religion.** Sabbath. The observance of the Sabbath, and detestation of idolatrous worship, are frequently inculcated together; and again, the breach of the Sabbath, and the worship of idols, are usually reprobated at the same time. Another good reason for the institution of a Sabbath might be, to remind the Jews of their deliverance from bondage, to inspire them with humanity to strangers and domestics, and to mitigate the rigour of servitude.

36  
and other  
festivals.

The purposes for which the other festivals of the Jewish religion were instituted appear also of sufficient importance. The great miracle, which, after a series of other miracles, all directed to the same end, finally effected the deliverance of the Jews out of Egypt, and their actual departure from that land of servitude, might well be commemorated in the feast of the passover. To recal to the minds of posterity the history of their ancestors, to impress them with a joyful and grateful sense of the goodness and greatness of God, and to make them think of the purposes for which his almighty power had been so gloriously exerted, were surely good reasons for the institution of such a festival. The feast of Pentecost commemorated the promulgation of the law by Moses, and the feast of Tabernacles, which followed the feast of the passover, was a solemn thanksgiving for the harvest. On the feast of Tabernacles, the wanderings of the Jews in the wilderness, and expressed their gratitude for the more comfortable circumstances in which they found themselves placed. The Jews were allowed to fix their calendar, and determine the times, which the other festivals were to be celebrated, on it trumpets were sounded, to give notice of the event, which was the cause of the festival, and the work was performed, divine service was performed, and the first fruits of the harvest were offered to the Lord. The Jewish legislation limited the festivals to a very small number, while the heathens devoted a considerable part of the year to the celebration of theirs. But we perceive the occasions upon which the Jewish festivals were celebrated to have been of sensible importance; whereas those of the heathens were often celebrated on trifling or ridiculous occasions. Party and innocent recreation shared the Jewish festival; the festivals of the heathens were chiefly devoted to debauchery and idleness.

37  
The Sabbath  
year, jubilee, and  
laws of  
usury.

The Hebrews had other solemn seasons of devotion besides the weekly Sabbath and these annual festivals. Every seventh year they rested from labour; they were then neither to plough, to sow, nor to prune; and whatever the earth produced spontaneously that year belonged rather to strangers, orphans, and the poor, than to the proprietors of the ground. On this year insolvent debtors were discharged from all debts contracted by purchasing the necessaries of life: and the great end of this release from debts contracted during the preceding six years, appears to have been to prevent the Hebrew from flying to the Gentiles and forsaking his religion when embarrassed in his circumstances. None but native Israelites and proselytes of righteousness were admitted to this privilege; it was refused to strangers, and even to proselytes of the gate. The jubilee was a festival to be celebrated every fiftieth year. It produced the same effects with the sabbatical year as to rest from labour and the discharge of debts; with this

addition, that on the year of the jubilee slaves obtained their freedom, and the lands reverted to the old proprietors. On the year of the jubilee, as on the sabbatical year, the lands were to rest uncultivated, and lawsuits were now to terminate. The chief design of this institution appears to have been, to preserve the order of ranks and property originally established in the Hebrew state. None but Israelites or circumcised converts could enjoy the benefit of this institution; nor could even these hope to regain their estates on the year of the jubilee, if they sold them for any other purpose but to supply their necessities. The law relative to usury was evidently founded on the same plan of policy with respect to property. To almost any other nation such a law, it must be confessed, would have been unsuitable and unjust: but as the Jews were not designed for a trading nation, they could have little occasion to borrow, unless to relieve distress; and as an indulgence to people in such circumstances, the Jew was forbidden to exact usury from his brother to whom he had lent money.

**Religion.**

The Jewish legislator, we may well think, would be disposed to adopt every proper method to prevent his nation from falling away into the idolatry of heathen nations. Probably one reason of the distinctions between clean beasts which they were permitted to eat, and unclean beasts, the eating of which they were taught to consider as pollution, was to prevent them from convivial intercourse with profane nations, by which they might be seduced to idolatry. We do not readily sit down at table with people who are fond of dishes which we regard with abhorrence. And if the Jews were taught to loathe the flesh of some of those animals which were among the greatest delicacies of the Gentiles, they would naturally of consequence avoid sitting down at meat with them, either at their ordinary meals or at those entertainments which they prepared in honour of their deities; and this we may with good reason consider as one happy mean to preserve them from idolatry. Besides, the Jews were permitted, or rather enjoined, to eat animals which the Gentiles revered as sacred, and from which they religiously withheld all violence. Goats, sheep, and oxen, were worshipped in Egypt (see POLYTHEISM and PAN); and several learned writers are of opinion, that Moses directed his people to sacrifice and eat certain of the favourite animals of the Egyptians, in order to remove from their minds any opinions which they might have otherwise entertained of the sanctity of those pretended deities. Many of the observances which Moses enjoined with regard to food, appear to have been intended to inspire the Israelites with contempt for the superstitions of the people among whom they had so long sojourned. They were to kill the animal which the Egyptians worshipped; to roast the flesh which that people ate raw; to eat the head, which they never ate; and to dress the entrails, which they set apart for divination. These distinctions concurred with the peculiarities of their dress, language, government, customs, places, and times of worship, and even the natural situation of their country, by which they were in a manner confined and fortified on all sides, to separate them in such a manner from neighbouring nations, that they might escape the infection of their idolatry. And if we reflect both on the design for which Providence separated the Israelites from other

38  
Of clean  
and unclean  
beasts, and  
the place  
of worship.

nations.

Religion. nations, and as the probability that, in the state of society in which mankind were during the earlier period of the Jewish history, the Jews, by mixing with other nations, would rather have been themselves converted to idolatry than have converted idolatrous nations to the worship of the true God; we cannot but be satisfied, that even this, however it may at first appear, was a benefit, not a disadvantage; and in the author of their legislation wisdom, not caprice.

39  
Other distinguishing particulars in the Jewish ritual.

But not only in the distinctions of meats, and between clean and unclean animals, does the legislator of the Jews appear to have laboured to fix a barrier between them and other nations which might prevent them from the contagion of idolatry—~~we shall not say~~, perhaps, if we ascribe many particulars of their worship to this design in the institutor. The heathens had gods who presided over woods, rivers, mountains, and valleys, and to each of these they offered sacrifices, and performed other rites of worship in a suitable place. Sometimes the grove, sometimes the mountain top, at other times the bank of the river or the brink of the spring, was the scene of their devotions. But as the unity of the divine nature was the truth the most earnestly inculcated on the children of Israel; so in order to impress that truth on their minds with the more powerful efficacy, they were taught to offer their sacrifices and other offerings only in one place, the place chosen by the Lord; and death was threatened to those who dared to disobey the command. To confirm this idea, one of the prophets intimates, that when idolatry should be abolished, the worship of God should not be confined to Jerusalem, but it would then be lawful to worship him anywhere.

40  
Effects of these institutions, &c. in impressing a respect for the Deity.

The whole institutions and observances of the Jewish religion appear to have been designed and happily calculated to impress the minds of the people with veneration and respect for the Deity. All the festivals which either commemorated some gracious dispensation of his providence towards their ancestors, or served as days of thanksgiving for the constant returns of his goodness to those who celebrated them, and all the other rites designed to fortify them against idolatry, served at the same time to impress their hearts with awful reverence for the God of Jacob. Various other particulars in the institutions of the Jewish economy appear to have been directed solely to that end. Into the most sacred place, the Holy of Holies, none but the high priest was admitted, and he only once a year. No fire was used in sacrifice but what was taken from the altar. Severe punishments were on various occasions inflicted on such as presumed to intermeddle in the service of the sanctuary in a manner contrary to what the law had directed. All the laws respecting the character, the circumstances, and the services, of the priests and the Levites, appear plainly to have a similar tendency.

In compliance with the notions of Deity which naturally prevailed among a gross and rude people, though no visible object of worship was granted to the Jews, yet they were allowed in their wanderings through the wilderness to have a tabernacle or portable temple, in which the sovereign of the universe sometimes deigned to display some rays of his glory. Incapable as they were of conceiving aright concerning the spiritual nature and the omnipresence of the Deity, they might

possibly have thought Jehovah careless and indifferent about them, had they been at no time favoured with a visible demonstration of his presence.

The sacrifices in use among the Gentiles in their worship of idols were permitted by the Jewish legislator; but he directed them to be offered with views very different from those with which the Gentiles sacrificed to their idols. Some of the sacrifices of the Jewish ritual were designed to avert the indignation of the Deity; some to expiate offences and purify the heart; and all of them to abolish or remove idolatry. Lustrations or ablutions entered likewise into the Jewish ritual; but these were recommended and enjoined by Moses for purposes widely different from those which induced the heathens to place so high a value upon them. The heathens purified them with magical and superstitious ceremonies; but in the Jewish ritual they were intended simply for the clearing away of impurities and pollutions.

The threatened form of punishment to which the Jews were liable, ~~the consequences which they were sure of~~ <sup>41</sup> ~~the consequences which they were equally~~ <sup>cracy and temporal</sup> ~~liable to suffer in the event of disobedience~~ <sup>functions,</sup> to remove idolatry, as well as to support the Jewish religion, they were taught to view with awe and trembling. They were taught to view with awe and trembling the consequences of disobedience to the law of God, and the punishments which were threatened as the punishments to be inflicted on those who violated his laws: and these punishments, as they were allowed, were happily accepted by the Jews as a more rude and carnal-minded people, as they were allowed, were happily accepted by the Jews as a more ~~present objects, and not likely to be viewed in a~~ <sup>42</sup> ~~and spiritual considerations.~~

There were other rites and observances of the Jewish law, which appear to have been designed to ~~prohibit~~ <sup>43</sup> ~~with religion, morals, or politics.~~ <sup>Rites and</sup> ~~The law was so constructed as to be~~ <sup>prohibi-</sup> ~~liable to be objected against, as adding no more than a~~ <sup>weight to</sup> ~~weight to a burden which, though heavy, might yet~~ <sup>have been otherwise borne in consideration of the</sup> ~~advantages connected with it.~~ <sup>Even these, however, may</sup> ~~perhaps admit of being viewed in a light in which they~~ <sup>shall appear to have been in no way unfavourable to the</sup> ~~happiness of those to whom they were enjoined.~~ <sup>They</sup> ~~appear to have had none of them an immoral tendency:~~ <sup>all of them had, in all probability, a tendency to re-</sup> ~~move or prevent idolatry, or to support, in some way~~ <sup>or other, the religious and the civil establishment to</sup> ~~which they belonged.~~

From these views of the spirit and tendency of the Jewish religion, we may fairly conclude it to have been admirably happily calculated to promote the welfare of society. In comparing it with other religions, it is necessary to reflect on the peculiar purposes for which it was given; that its two principal objects were to preserve the Jews a separate people, and to guard them against the contagion of the surrounding idolatry. When these things are taken into consideration, every candid mind acquainted with the history of ancient nations will readily acknowledge that the whole system, though calculated indeed in a peculiar manner for them, was as happily adapted for the purposes for which it had been wisely and graciously intended, as it is possible to imagine any such

Religion. would perhaps ere this time have been lost in oblivion. Individuals in private life seldom engage the attention of the historian; his object is to record the actions of princes, warriors, and statesmen. Had not the professors of Christianity in the earlier ages of its existence been exposed to prosecutions and unjust accusations from which they were called on to vindicate themselves, we should be strangers to the names and virtues of saints and martyrs, and to the learning and endowments of the first apologists for Christianity. We can therefore only trace the general influence of the institutions of Christianity on society. We cannot hope to make an accurate enumeration of particulars. In many of the countries in which it has been established, it has produced a very favourable change on the circumstances of domestic life. Polygamy, a practice repugnant to the will of our Creator (see POLYGAMY), who has declared his intentions in this instance in the plainest manner, by causing nearly equal numbers of males and females to be brought into the world, was never completely abolished but by Christianity.

48  
its effects  
on the  
manners of  
nations.

The practice of divorce, too, though in some cases proper and even necessary, had been so much abused at the time of our Saviour's appearance in the world, that he found reason to declare it unlawful, unless in the case of adultery. The propriety and reasonableness of this prohibition will sufficiently appear, if we consider, that when divorces are easily obtained, both parties will often have nothing else in view at the period of marriage than the dissolution of their nuptial engagements after a short cohabitation: the interests of the husband and the wife will almost always be separate; and the children of such a marriage are scarce likely to enjoy the cordial affection and tender watchful care of either parent. The husband in such a case will naturally be to his wife, not a friend and protector, but a tyrant; fear and deceit, not love, gratitude, or a sense of duty, will be the principles of the wife's obedience.

In another instance, likewise, Christianity has produced a happy change on the circumstances of domestic life; it must be acknowledged to have contributed greatly to the abolition of slavery, or at least to the mitigation of the rigour of servitude. The customs and laws of the Romans in relation to slaves were cruel and severe. Masters were often so inhuman as to remove aged, sick, or infirm slaves, into an island in the Tiber, where they suffered them to perish without pity or assistance. The greater part of the subjects of many of those republics which enjoyed the most liberty, groined under tyrannical oppression; they were condemned to drag out a miserable existence in hard labour, under inhuman usage, and to be transferred like beasts from one master to another. The hardships of slavery were eased, not by any particular precept of the Gospel, but by the gentle and humane spirit which breathed through the general tenor of the whole system of doctrines and precepts of which the Gospel consists. It must indeed be allowed, that a trade in slaves is at present carried on by people who presume to call themselves Christians, and protected by the legislature of Christian states: but the spirit of the Christian code condemns the practice, and the true Christian will not engage in it.

Partly by the direct and conspicuous, partly by the secret and unseen, influence of Christianity since its promulgation in the world, the hearts of men have been

gradually softened; even barbarians have been formed to mildness and humanity; the influence of selfishness has been checked and restrained; and even war, amid all the pernicious improvements by which men have sought to render it more terrible, has assumed much more of the spirit of mildness and peace than ever entered into it during the reign of heathenism.

If we review the history of mankind with a view to their political circumstances, we shall find, that by some means or other, it has happened, since that time, when the Gospel was first preached, that both systems of legislation and forms of government have been raised to much greater perfection, at least in those parts of the world in which the religion of Jesus has made its way, and secured its establishment.

The popular government of the Romans, notwithstanding the multiplicity of their laws, and the imperfections of their political constitution, was, no doubt, happily enough adapted to promote the increase of the power and the extension of the empire of Rome. In Greece there were various branches of the wisdom and impartiality of which were highly celebrated. But we apprehend, that the number of well authenticated examples, which prove, that since Christianity has been introduced, there has not been sufficient time to produce a more perfect system of laws, and literature, and science, and arts, and manners, of which might appear to be the result of the wisdom and models of antiquity, to the knowledge of which the people in general, their rulers, and their legislators, were provided for than under the laws of the Romans, or even of Rome in the days of her greatest glory, and just and happy observation of which, has been attributed so much to the influence of the Christian religion, that "the progress of the Christian religion, recommended in the Gospel is incompatible with the impetuous rage with which an arbitrary tyrant exercises his subjects, and exercises himself in cruelty and oppression; Christian religion (says he) which, in the progress of empire, and the influence of climate, has rendered despotism from being established in Ethiopia, and has carried into Africa the manners of Europe. The hero to the empire of Ethiopia enjoys a principality, and gives to other subjects an example of love and obedience. Not far from hence may be seen the Mahometan shutting up the children of the king of Sennaar, at whose death the council sends to murder them in favour of the prince who ascends the throne. Let us set before our eyes (continues that eloquent writer), in the third chapter of the 24th book of his Spirit of Laws, on one hand the continual massacres of the kings and generals of the Greeks and Romans, and on the other the destruction of people and cities by the famous conquerors Timur Beg and Jenghiz Khan, who ravaged Asia; and we shall perceive, that we owe to Christianity in government a certain political law, and in war a certain law of nations, which allows to the conquered the great advantages of liberty, laws, wealth, and always religion, when the conqueror is not blind to his own interest."

These are the reflections of no common judge in this matter, but one who had long studied the history of nations, and observed the phenomena of the various forms of society, with such success as few others have attained.

But

Religion.

49  
Its effects  
in softening  
and huma-  
nizing bar-  
barians.

But on no occasion has the mild influence of Christianity been more eminently displayed, or more happily exerted, than in softening and humanizing the barbarians who overturned the Roman empire. The idolatrous religion which prevailed among those tribes before their conversion to Christianity, instead of disposing them to cultivate humanity and mildness of manners, contributed strongly to render them fierce and blood-thirsty, and eager to distinguish themselves by deeds of savage valour. But no sooner had they settled in the dominions of Rome, and embraced the principles of Christianity, than they became a mild and generous people.

We are informed by Mosheim, who was at pains to collect his materials from the most authentic sources, that in the 10th century Christian princes exerted themselves in the conversion of nations whose ferocity they had experienced, in order to soften and render them more gentle. The natural humanity with which nations at war treat each other in modern times, is certainly owing, in a great measure, to the influence of the mild precepts of Christianity. It is a fact worthy of notice, that in the most barbarous ages, the spiritual fathers of the church were rational and impartial in their judgments.

The same mildness which prevailed among the Christians, was not confined by their conversion to the Roman empire. All nations have been civilized, and have rejected the vicious customs of the heathen. In Parthia, where polygamy was practised, they are not polygamists; the Persian emperor does not marry his own daughter; the law of Zoroaster the Persians considered as a crime, and observed the temperance, as enjoined by its precepts. The civilized and enlightened Romans were shocked at the blood-thirsty before the propagation of the Gospel. The breaking of a glass, or some such trifling custom, was sufficient to provoke Vindex Pollio to cast his guests into fish-ponds to be devoured by lampreys. The effusion of human blood was their favourite entertainment; they delighted to see men combating with beasts, or with one another; and we are informed on respectable authority, that no warrior made such havoc on mankind as the fights of gladiators, which sometimes deprived Europe of 20,000 lives in one month. Not the humanity of Titus, nor the wisdom and virtue of Trajan, could abolish the barbarous spectacle. However humane and wise in other instances, in this practice those princes complied with the custom of their country, and exhibited splendid shows of gladiators, in which the combatants were matched by pairs; who, though they had never injured nor offended each other, yet were obliged to maim and murder one another in cold blood. Christian divines soon exercised their pens against these horrid practices; the Christian emperor Constantine restrained them by edicts, and Honorius finally abolished them. It would be tedious to proceed through an enumeration of particulars; but wherever Christianity has been propagated, it has constantly operated to the civilization of the manners of mankind, and to the abolition of absurd and criminal practices. The Irish, the Scotch, and all the ancient inhabitants of the British isles, were, notwithstanding

their intercourse with the Romans, rude barbarians, till such time as they were converted to Christianity. The inhuman practice of exposing infants, which once prevailed so generally over the world, and still prevails among some Pagan nations, even under very humane and enlightened legislatures, yielded to the influence of Christianity.

Let us likewise remember, in honour of Christianity, that it has contributed eminently to the diffusion of knowledge, the preservation and the advancement of learning. When the barbarians overspread Europe, what must have become of the precious remains of polished, enlightened antiquity, had there been no other depositaries to preserve them but the heathen priests? We allow that even the Romish clergy during the dark ages did not study the celebrated models of ancient times with much advantage themselves, and did not labour with much assiduity to make the laity acquainted with them. It must even be acknowledged, that they did not always preserve those monuments of genius with sufficient care, as they were often ignorant of their real value. Yet, after all, it will be granted, it cannot be denied, that had it not been for the clergy of the Christian church, the lamp of learning would, in all probability, have been entirely extinguished, during that night of ignorance and barbarity in which all Europe was buried for a long series of centuries, after the irruption of the barbarians into the Roman empire.

Such is the existence of the Christian system, and such its tendency to meliorate the human character, that its beneficial influence has not been confined to those who have received its doctrines and precepts, and have professed themselves Christians; it has even produced many happy effects on the circumstances and the characters of Pagans and infidels, who have had opportunities of beholding the virtues of Christians, and learning the excellence of the morality of the gospel. Those virtues which distinguished the character of the apostate Julian were surely owing in no inconsiderable degree to his acquaintance with Christianity; and it is an undeniable fact, that after the propagation of Christianity through the Roman empire, even while the purity of that holy religion was gradually debased, the manners of those Pagans who remained unconverted became more pure, and their religious notions and worship less immoral and absurd.—We might here adduce a tedious series of facts to the same purpose. Whenever Christians have had any intercourse with Pagan idolaters, and have not concealed the laws of the gospel, nor shown by their conduct that they disregarded them, even those who have not been converted to Christianity have, however, been improved in their dispositions and manners by its influence. The emperor, whose virtues we have mentioned as arising, in a certain degree, from his acquaintance with Christianity, in a letter to a heathen pontiff, desires him to turn his eyes to the means by which the superstition of Christians was propagated: by kindness to strangers, by sanctity of life, and by the attention which they paid to the burial of the dead. He recommends an imitation of their virtues, exhorts him to cause the priests of Galatia to be attentive to the worship of their gods, and authorizes him to strip them of the sacerdotal function, unless they obliged their wives, children, and servants,

**Religion.** to pay attention to the same duties. He likewise joins works of beneficence, desires the priest to relieve the distressed, and to build houses for the accommodation of strangers of whatever religion; and says, it is a disgrace for Pagans to disregard those of their own religion, while Christians do kind offices to strangers and enemies. This is indeed an eminent instance of the happy influence of Christianity even on the sentiments and manners of those who regarded the Christian name with abhorrence.

52  
Christianity to be preferred to all other religions.

Upon the whole then, may we not, from the particulars here exhibited concerning the influence of this religion on the manners and happiness of men in society, conclude that Christianity is infinitely superior to the superstitions of Paganism? as being in its tendency uniformly favourable to the virtue and the happiness of mankind, and even to the system of religion and laws delivered by Moses to the children of Israel: because, while the religion of the Jews was calculated only for one particular nation, and it may almost be said for one particular stage in the progress of society, Christianity is an universal religion, formed to exert its happy influence in all ages and among all nations: and has a tendency to dispel the shades of barbarism and ignorance, to promote the cultivation of the powers of the human understanding, and to encourage every virtuous refinement of manners.

53  
View of Mahometanism.

V. Another religion which has made, and still makes, a conspicuous figure in the world remains yet to be examined. The religion of Mahomet is that which we here allude to. Whether we consider through what an extensive part of the globe that religion prevails, the political importance of the nations among whom it is professed, or the striking peculiarity of character by which it is distinguished from all other religious systems—it is for all these reasons well worthy of particular notice. Like the Jewish religion, it is not barely a system of religious doctrines and general moral precepts; it forms both the civil legislature and the religious system of those nations among whom it is professed; and, like it too, it would appear to be calculated rather for one particular period in the progress of mankind from rudeness to refinement, than for all ages and all states of society.

The history of its origin is pretty well known, and we have had occasion to enlarge upon it under a former article (see MAHOMET and MAHOMETANISM). We are not here to trace the impostures of the prophet, or to consider the arts by which he so successfully accomplished his designs; but merely to consider the morality of his religion, and its influence on civil order and the happiness of society.

54  
It is friendly to ignorance, despotism, and impurity.

If we view the state of the nations among whom it is established, we cannot hesitate a moment to declare it friendly to ignorance, to despotism, and to impurity of manners. The Turks, the Persians, and the Malays, are all Mahometans; and in reviewing their history and considering their present state, we might find a sufficient number of facts to justify the above assertion: and we must not neglect to observe, that as those nations are not known to have ever been since their conversion to Mahometanism under a much happier government, or in a much more civilized state than at present, it cannot be with any degree of fairness, argued, with respect to Mahometanism as with respect to Christianity,

that it is only when its influence is so opposed by other causes as to prevent it from producing its full effects, that it does not conduct those societies among which it is established to an high state of civilization and refinement.

One, and that by no means an inconsiderable, part of the Koran, was occasionally invented to solve some difficulty with which the prophet found himself at the time perplexed, or to help him to the gratification of his rising passions, lust and ambition. When he and his followers were, at any time, unsuccessful in those wars by which he sought to propagate his religion, to prevent them from falling away into unbelief, or sinking into despondency, he took care to inform them that God would send such misfortunes to befall believers, as a punishment for their sins, and to try their faith. The doctrine of predestination, which he assiduously inculcated, had a happy effect, to persuade his followers to rest boldly into the midst of death and danger at his command. He instructed his wife to put away his wife, married her himself, and declared that his crime had the approbation of God. In the Koran, he introduces the Devil as a tempter to his followers. Being repulsed from the temple of Mecca, he endeavours with the inhabitants of Medina to make a treaty, making it convenient to him, that he should break this treaty, he justified his conduct by a story, which he told to disregard promises, and to show that he was not to be deterred by any oath. In some instances again, we find that he has joined for similar reasons his followers to some occasion drunk to excess, washed his face in confusion in the camp, he prohibited the use of other intoxicating liquors among his followers. Now, though it must be acknowledged that some arise from the use of these liquors, yet we cannot think that when used in moderation they are so beneficial to men; and certainly are not so ordered by God as opium, which the Mahometans have substituted in their place.

Mahomet is allowed to have copied from the Christian and the Jewish religions, as well as from the idolatrous superstitions which prevailed through Arabia, and thus to have formed a motley mixture of reason and absurdity, of pure truth and wild superstition. He considered also the circumstances of his country, and the prejudices of his countrymen. When he attended to the simplicity he was generally judicious enough to suit his doctrines and decisions to them with sufficient skill; the latter he also managed with the greatest art: but he entered into accommodation with them in instances when a true prophet or a wise and upright legislator would surely have opposed them with decisive vigour. Where the prophet indulges his own fancy, or borrows from the superstitions of his countrymen, nothing can be more ridiculous than that rhapsody of lies, contradictions, and extravagant fables, which he delivers to his followers. Amazing are the absurdities which he relates concerning the patriarchs, concerning Solomon, and concerning the animals that were assembled in Noah's ark.

But in the whole tissue of absurdities of which his system consists, there is nothing more absurd, or more happily calculated to promote impurity of manners, than his descriptions of heaven and hell; the ideas of future rewards and punishments which he sought to impress

on the minds of his followers. Paradise was to abound with rivers, trees, fruits, and shady groves; wine which would not intoxicate was to be there plentifully served up to believers; the inhabitants of that happy region were all to enjoy perpetual youth; and their powers of enjoyment were to be enlarged and invigorated, in order that so many fine things might not be thrown away upon them. "Instead of inspiring the blessed inhabitants of paradise with a liberal taste for harmony and science, conversation, and friendship (says Mr. Gibbon), Mahomet idly celebrates the pearls and diamonds, the robes of silk, palaces of marble, dignities of gold, rich wines, artificial dainties, numerous attendants, and the whole train of sensual luxury. Scattered about, or black-eyed girls of resplendent beauty, blooming youth, virgin purity, and exquisite sensibility, were created for the use of the Arabian holier; a woman of pleasure will be exchanged for seven years, and his faculties will be refreshed, till he is able to render him worthy of his bride. He is acknowledged that his religion is not calculated to produce any enjoyment more than that which is derived from the face of God morning and evening. It is not designed to exceed all the pleasures of the world. The following is his description of the pleasures of paradise: The wicked are punished in hell, where they drink water; the good are rewarded in heaven, where they drink wine for ever in conversation with the angels; and nothing but briars and thorns are to be seen. A tree that riseth out of the bottom of hell, whose branches resemble the heads of serpents, and whose fruits shall be in their bellies like the figs of the tree of life."

From a general view of the character of Mahometanism, from considering the character of the prophet, and from tracing the history of the religion, it appears that it has been established, is, that it is a religion of superstition, with a few truths, however, which are interspersed; that it is a religion of superstition, with a few truths, however, which are interspersed; that a great part of it is unfavourable to virtuous manners, and to the progress of knowledge and refinement; it often inculcates in a direct manner sentiments that are highly immoral; it substitutes trifling superstitious observances in the room of genuine piety and moral virtue; and it gives such views of futurity as render partly of necessity a necessary qualification for seeing God.

58  
Mahometanism to be preferred to Paganism.

Surely, therefore, even the Deist, who rejects all but natural religion, would not hesitate to prefer Christianity, and even Judaism, to the religion of Mahomet. Judaism, calculated for a peculiar people, was undoubtedly much more sublime and much more happily framed to render that people virtuous and happy in the circumstances in which they were placed; and Christianity we find to be an universal religion, suited to all circumstances and to all the stages of society; and acting, wherever it is received, with more or less force to the support of civil order, virtuous manners, improvement of arts, and the advancement of science. However, as Mahometanism forms in some measure a regular system, as it has borrowed many of the precepts and doctrines of Judaism and Christianity, not indeed without corrupting and degrading them; and as it has contributed considerably to the support of civil government, although in a very imperfect form, in those countries in which it has obtained an establishment; for all these

reasons we cannot but give it the preference to the superstitious of Paganism.

Religion  
Rembrandt

59  
Conclusion.

THE whole result of our inquiries under this article, therefore, is, 1. That, as man, by the constitution of his mind, is naturally fitted for acquiring certain notions concerning the existence of invisible, superior beings, and their influence on human life; so the religious ideas which we find to have in all ages of the world, and in all the different stages of the progress of society, prevailed among mankind, appear to have originated partly from the natural exertions of the human imagination, understanding, and passions, in various circumstances, and partly from supernatural revelation.

2. That though religious opinions, together with the moral precepts, and the rites of worship connected with them, may appear to have been in numerous instances injurious to the virtue and happiness of society; yet, as they have often contributed to lead the mind to form moral distinctions, when it would otherwise in all probability have been an entire stranger to such distinctions; and as they have always contributed in an essential manner to the establishment and the support of civil government—it must therefore be acknowledged that they have always, even in their humblest state, been more beneficial than hurtful to mankind.

3. That when the different systems of religion that have prevailed in the world are comparatively viewed with respect to their influence on the welfare of society, we find reason to prefer the polytheism of the Greeks and Romans to the ruder, wilder, religious ideas and ceremonies that have prevailed among savages; Mahometanism, perhaps in some respects, to the polytheism of the Greeks and Romans; Judaism however to Mahometanism; and Christianity to all of them.

RELIGIOUS, in a general sense, something that relates to religion. We say, a religious life, religious society, &c. Churches and churchyards are religious places. A religious war is also called a *croisade*. See *CROISADE*.

RELIGIOUS, is also used substantially for a person engaged by solemn vows to the monastic life; or a person shut up in a monastery to lead a life of devotion and austerity, under some rule or institution. The male religious we popularly call *monks* and *friars*; the female, *nuns* and *conventresses*.

REMBRANDT (Van Rhin), a Flemish painter and engraver of great eminence, was born in 1606, in a mill upon the banks of the Rhine, from whence he derived his name of *Van Rhin*. This master was born with a creative genius, which never attained perfection. It was said of him, that he would have invented painting, if he had not found it already discovered. Without study, without the assistance of any master, but by his own instinct, he formed rules, and a certain practical method for colouring; and the mixture produced the designed effect. Nature is not set off to the greatest advantage in his pictures; but there is such a striking truth and simplicity in them, that his heads, particularly his portraits, seem animated, and rising from the canvas. He was fond of strong contrasts of light and shade. The light entered in his working-room only by a hole, in a manner of a camera obscura, by which he judged with greater certainty of his productions. This artist considered painting like the stage, where

Rembrandt  
Remem-  
brancers.

where the characters do not strike unless they are exaggerated. He did not pursue the method of the Flemish painters of finishing his pieces. He sometimes gave his light such thick touches, that it seemed more like modelling than painting. A head of his has been shown, the nose of which was so thick of paint, as that which he copied from nature. He was told one day, that by his peculiar method of employing colours, his pieces appeared rugged and uneven—he replied, he was a painter, and not a dyer. He took a pleasure in dressing his figures in an extraordinary manner. With this view he had collected a great number of cloaks, caps, ancient armour, and drapery long since out of fashion. When he was advised to consult antiquity to attain a better taste in drawing, as his was usually heavy and uneven, he took his counsellor to the closet where these old vestments were deposited, saying, by way of derision, those were his antiques.

Rembrandt, like most men of genius, had many caprices. Being one day at work, painting a whole family in a single picture, word being brought him that his monkey was dead, he was so affected at the loss of this animal, that, without paying any attention to the persons who were sitting for their pictures, he painted the monkey upon the same canvas. This whim could not fail of displeasing those the piece was designed for; but he would not efface it, choosing rather to lose the sale of his picture.

This freak will appear still more extraordinary in Rembrandt, when it is considered that he was extremely avaricious; which vice daily grew upon him. He practised various stratagems to sell his prints at a high price. The public were very desirous of purchasing them, and not without reason. In his prints the same taste prevails as in his pictures; they are rough and irregular, but picturesque. In order to heighten the value of his prints, and increase their price, he made his son sell them as if he had purloined them from his father; others he exposed at public sales, and went thither himself in disguise to bid for them; sometimes he gave out that he was going to leave Holland, and settle in another country. These stratagems were successful, and he got his own price for his prints. At other times he would print his plates half finished, and expose them to sale; he afterwards finished them, and they became fresh plates. When they wanted retouching, he made some alterations in them, which promoted the sale of his prints a third time, though they differed but little from the first impressions.

His pupils, who were not ignorant of his avarice, one day painted some pieces of money upon cards; and Rembrandt no sooner saw them, than he was going to take them up. He was not angry at the plebeianry, but his avarice still prevailed. He died in 1669.

**REMEMBRANCE**, is when the idea of something formerly known recurs again to the mind without the operation of a like object on the external sensory. See **MEMORY** and **REMINISCENCE**.

**REMEMBRANCERS**, anciently called *clerks of the remembrance*, certain officers in the exchequer, where of three are distinguished by the names of the *king's remembrancer*, the *lord treasurer's remembrancer*, and the *remembrancer of the first fruits*. The king's remembrancer enters in his office all recognizances taken before the barons for any of the king's debts, for appearances

or observing of orders; he also takes all bonds for the king's debts, &c. and makes out processes thereon. He likewise issues processes against the collectors of the customs, excise, and others, for their accounts; and informations upon penal statutes are entered and sued in his office, where all proceedings in matters upon English bills in the exchequer chamber remain. His duty further is to make out the bills of compositions upon penal laws, to take the statement of debts; and into his office are delivered all kinds of indentures and other contracts which concern the assuring any lands to the crown. He every year, in *crastino animarum*, reads in court the statute for election of sheriffs; and likewise reads in court the oaths of all the officers, before they are admitted.

The *lord treasurer's remembrancer* is charged to make out process against all sheriffs, escheators, receivers, and bailiffs, for their accounts. He also makes out writs of *fiat justitia*, and extent for debts due to the king, either in the proper writs, and process for all such debts as are due to the king by account of his tenants. He also takes the oaths of the sheriffs, and also keeps a record of the names of the sheriffs, and the sheriffs or other officers who have been appointed at Easter and Michaelmas. He also keeps a record of the names of the sheriffs, and the sheriffs or other officers who have been appointed at Easter and Michaelmas. He also keeps a record of the names of the sheriffs, and the sheriffs or other officers who have been appointed at Easter and Michaelmas.

The remembrancer of the *first fruits* takes all compositions and bonds for the payment of first fruits and tenths; and makes out process against those who do not pay the same.

**REMINISCENCE**, that power of the human mind, whereby it recollects itself, or calls again into remembrance such ideas or notions as it has once forgotten; in which it differs from *memory*, which is a treasuring up of things in the mind, and keeping them there, without forgetting them.

**REMISSION**, in physics, the abatement of the power or efficacy of any quality; in opposition to the *increase* of the same, which is called *intension*.

**Remission**, in law, &c. denotes the pardon of a crime, or the giving up the punishment due thereto.

**Remission**, in medicine, is when a distemper abates for a time, but does not go quite off.

**REMITTANCE**, in commerce, the traffic or removal of money from one place to another, by bills of exchange, orders, or the like.

**REMONSTRANCE**, an expostulation or humble supplication, addressed to a king, or other superior, beseeching him to reflect on the inconveniences or ill consequences of some order, edict, or the like. This work is also used for an expostulatory counsel, or advice; or a gentle and handsome reproof, made either in general, or particular, to apprise of or correct some fault, &c.

**REMORA**, or **SUCKING-FISH**, a species of *ECHENEIS*. Many incredible things are related of this animal by the ancients; as that it had the power of stopping the largest and swiftest vessel in its course; and even to this day it is asserted by the fishermen in the Mediterranean, that it has a power of retarding the motion of their boats by attaching itself to them: for

Remem-  
brancers  
Remora.

**Remorse**, which reason they kill it whenever they perceive this retardation. But in what manner the remora performs this, we have no account.

**REMORSE**, in its worst sense, means that pain or anguish which one feels after having committed some bad action. It also means tenderness, pity, or sympathetic sorrow. It is most generally used in a bad sense, and is applied to persons who feel compunction for some great crime, as murder, and such like. Murders which have been committed with the utmost circumpection and secrecy, and the authors of which could never have been discovered by any human investigation, have been frequently unfolded by the remorse and confession of the perpetrators, and that too many years afterwards. Of this there are numerous instances, which are well authenticated, and which are so generally known that it is needless to relate them here. See **REPENTANCE**.

**REMPHAN**, an idol or Pagan god whom St Stephen says the Israelites worshipped in the wilderness as they passed from Egypt to the land of Promise: "Yea, ye took up the tabernacle of Moloch, and the star of your god, even the image which ye made to worship: ye took up the Canaanite, Remphan, whom ye serve." The following words of the apostle, in all commentators are agreed, "Ye took up the tabernacle of your Moloch, and the star of your god, which is Remphan." But if this coincidence between the Canaanite preacher and the Jewish prophet be admitted, it follows, that *Chim* and *Remphan* are two names of one and the same deity. This indeed is evident from the LXX translators having substituted in this version the word *Remphan*, instead of *Chim*, which we read in the Hebrew and English Bibles. But the question which still remains to be answered, what god was worshipped by the name of *Remphan*, or *Chim*? for about the other divinity there is no dispute. See **MOLOCH**.

That *Chim* or *Remphan* was an Egyptian divinity, cannot be questioned; for at the era of the Exodus the Hebrews must have been strangers to the idolatrous worship of all other nations; nor are they ever accused of any other than Egyptian idolatry during their 40 years wanderings in the wilderness, till towards the end of that period that they became infected by the Moabites with the worship of *Baal-peor*. That *Moloch*, *Molech*, *Malek*, or *Mileom*, in its original acceptation denotes a king or chief, is known to every oriental scholar; and therefore when it is used as the name of a god, it undoubtedly signifies the sun, and is the same divinity with the Egyptian *Osiris*. Reasoning in this way, many critics, and we believe Selden is in the number, have concluded that *Chim*, and of course *Remphan*, is the planet Saturn; because *Chim*, is written *Chim*, *Cavan*, *Cruan*, *Chevvim*; all of which are modern oriental names of that planet.

But against this hypothesis insurmountable objections present themselves to our minds. It is universally allowed (see **POLYTHEISM**), that the first objects of idolatrous worship were the sun and moon, considered

as the king and queen of heaven. The fixed stars, indeed, and the planet, were afterwards gradually admitted into the Pagan rubric; but we may be sure that those would be first associated with the two prime luminaries which most resemble them in brightness, and were supposed to be most benignant to man. But the planet Saturn appears to the naked eye with so feeble a lustre, that, in the infancy of astronomy, it could not make such an impression on the mind as to excite that admiration which we must conceive to have always preceded planetary worship. It is to be observed, too, that by the Pagan writers of antiquity Saturn is constantly represented as a star of baleful influence. He is termed the *leadens planet*; the *planet of the malevolent aspect*; the *dismal*, the *inhumane star*. That the Egyptians, at so early a period as that under consideration, should have adored as one of their greatest gods a planet obscure in its appearance, distant in its situation, and baleful in its influence, is wholly incredible.

There is, however, another star which they might naturally adore, and which we know they actually did adore, as one of their most beneficent gods, at a very early period. This is the *acervus* or *crucis* of the Greeks, the *canis* or *stella canicularis* of the Romans, and the *dog-star* of modern Europe. By the Egyptians it was called *Sothis* or *Soth*, which signifies *safety*, *lenescence*, *fecundity*; and it received this name, because making its appearance in the heavens at the very time when the Nile overflowed the country, it was supposed to regulate the inundation. On this account Plutarch (*Isis et Osiris*) tells us, they believed the soul of their illustrious benefactress *Isis* to have transmigrated into the star *Sothis*, which they therefore worshipped as the divinity which rendered their country fruitful. It made its appearance, too, on the first day of the month *Thoth* (A), which was the beginning of the Egyptian year, and as such celebrated with feasting and festivity; and being by much the brightest star in the heavens, Horopullos (*cap. 3.*) informs us it was considered as sovereign over the rest. A combination of so many important circumstances might have induced a people less superstitious than the Egyptians to pay divine homage to that glorious luminary, which was confounded with *Isis*, who had been long regarded with the highest veneration; and as *Isis* was the wife and sister of *Osiris*, and always associated with him, the star of *Isis* or *Remphan* was naturally associated with *Moloch*, the same with *Osiris*.

But it will be asked, how the star which by the Egyptians was called *Soth* or *Sothis* came to be worshipped by the Hebrews under the appellation of *Chim* or *Remphan*? This is a very pertinent question, and we shall endeavour to answer it.

Every one knows that the pronunciation of oriental words is very uncertain; and that as the vowels were often omitted in writing, it is of very little importance to the meaning how they be supplied, provided we retain the radical consonants. The word *Chim* may with equal propriety be written *Kim*, *Kion*, or even *Kyon*, the

(A) This was the case at a very remote period; but it is otherwise at present, owing to the *PRECESSION* of the Equinoxes. See that article.

Remphan. the Hebrew *jod* being convertible into the Greek *υ* or the Roman *y*; but the words *Cane, Chan, Kan, or Khan*, which are often diversified into *Ken, Kyn, Cohen, Gaban*, signifying *Head, Chief, Prince, King*, &c. are diffused through a great part of Asia and Europe. In the Chinese language *Quin*, which signifies a *King*, is so similar to the word *Chiun* or *Khiun* under consideration, that no etymologist will hesitate to pronounce them of the same original and the same import. The word *Kan* or *Khan* is universally known to be an honorary title in Tartary; and *Kaian* or *Kain*, which is not only cognate of the word *Chiun* or *Kiun*, is, in the Persian or old Persian language, the epithet applied to the dynasty of princes which succeeded Cyrus the Great. Among the Scythians or ancient Tartars, *Ghiun* signifies the *Sun* and likewise the *day*; and *Kung, Kuning, Kun*, runs through all the dialects of the Gothic tongue, everywhere denoting a *chief* or *sovereign*. In the Syrian dialect, *Kon* signifies a prince; and hence the Almighty is styled (Gen. xiv. 19.) *Konah*, which is translated *possessor*, but might have, with perhaps more propriety, been rendered *Sovereign* of heaven and earth. In Hebrew, the word *Kaban* or *Kaben*, which is the very same with *Khan* or *Kan*, signifies either a *priest* or a *prince*; and in Egypt *Kon* was the name of the first Hercules or the *sun*. Hence the same word in composition denotes greatness, as *Can-abus* the great serpent; *Can-abolth*, the great *Thoth* or Mercury; *Can-osiris*, the great *Osiris*.

From this deduction we would conclude, that the word, which is found in so many tongues, and always denotes *Chief, Prince, Sovereign*, is the very word *Chiun* which the Egyptians and Hebrews applied to *Sotbis*, as being, in their conceptions, the chief or sovereign of all the stars. This will appear still more probable, when we have ascertained the import of the word *Remphan*, or, as the LXX have it, *Raiphan*.

*Phan*, the latter part of this word, is unquestionably the same with *Pan*, the most ancient of the Egyptian gods (see *PAN*). It is likewise a cognate of the Hebrew *Phanab*, conspexit, spectavit, vidit; and the radical word seems to be *PHAN*, which signifies sometimes the countenance, and sometimes *light*. Hence *Phaeton*, which is compounded of *pha* light, *etb* or *esh* fire, and *on* strength, came to be one of the names of the sun. *Rui*, which we commonly write *Rajah*, has long signified, among the Indians, a subordinate prince; and we know, that between India and Egypt there was a very early intercourse. *Raiphan*, therefore, may be either the *royal light* or the *bright prince*, subordinate to Osiris; and in either sense, it was a very proper epithet of *Sothis* in the Egyptian kalender. The word *Rem* or *Rom*, again (for it is sometimes written *Remphan*, and sometimes *Rompha*), is no other than the Hebrew רום *Rum* "high, exalted." Hence *Remphan* is the *high* or *exalted light*, which *Sothis* certainly was.

For this etymological disquisition we are indebted to Dr Poig, the learned author of *Letters on the Savage State*, who has written a dissertation on *Chim* and *Remphan*, of such value that we hope it will not be much longer withheld from the public. The ascertaining the identity of those names, and the god to which they belonged, is the least of its merit ; for it will be found to throw much light upon many passages in the Old Testament. What confirms his interpretation is, that

the idol consecrated by the Egyptians to *Solhis* or the *Ram-headed*  
dog-star, was a female figure with a star on her head;  
and hence the prophet upbraids his countrymen with  
having borne the *Star* of their deity.

**ACTION OF REMOVING**, in Scots law. See **LAW**, N<sup>o</sup> clxvii. 18.

REMURIA, festivals established at Rome by Romulus to appease the manes of his brother Remus. They were afterwards called *Lemuria*, and celebrated yearly.

ROMULUS, the brother of Remulus, was exposed to death with his brother by the cruelty of his grandfather. In the contest which happened between the two brothers in building a city, Romulus obtained the victory, and Remus, for ridiculing the rising walls, was slain by his brother's orders, or by Romulus himself (*see ROMULUS*). The Romans were much affected by this murder, upon which the oracle was consulted, and the name of Remus appeared by the institution of the Remuria.

RENAL, (pertaining to the reins or Kid-  
neys.

RENCOUNTER. n. A meeting, esp. an encounter of two little boys, who fight in a senseless encounter. The boys fought a blood-battle.

**Rencontre** is a combat of contradiſtinction, and fight on the ſpot, without combat, it is called a **rencontre**.

RENDEZVOUS, or a meeting arranged to meet in at a certain day and hour.

RENEALMIA, in botanical nomenclature, a genus of the gynoecium order, belonging to the natural order of the Rubiacae. The corolla is trilocular; the perianth is monophyllous; the anthers are monophyllous; the berry is fleshy. There is only one species, which is a native of Surinam.

**RENEGADE**, or **KENEGAD**, a person who has apostatized or renounced the Christian faith, to embrace some other religion, particularly Mohammedanism.

**RENFREW**, the county-town of Renfrewshire, standing on the small river Cathcart, which flows into the Clyde at the distance of five miles from Glasgow, is a small but ancient royal borough, the seat of the sheriff's court and of a presbytery. The town is neatly built, and the inhabitants enjoy a tolerable share of commerce. Renfrew was originally joined to Lanerk, but was made an independent sheriffdom by Robert II. who had a palace here. *W. Long. 4. 26. N. Lat. 55. 51.*

**RENFREWSHIRE**, a county of Scotland, styled by way of eminence the *barony*, because it was the ancient inheritance of the Stuarts, is a small county, extending about 20 miles from north to south, and 13 from east to west, parted from Dumbartonshire by the river Clyde on the west, bordering on the east with Lanarkshire, and on the north with Cunningham. The face of the country is varied with hill and vale, wood and stream; crowded with populous villages, and adorned with the seats of gentlemen. The soil is in general fertile, producing rye, barley, oats, peas, beans, flax, and some wheat: it likewise yields plenty of coal, and turf for fuel: and affords abundance of pasturage for sheep and cattle. The inhabitants are Lowlanders and Presbyterians: wealthy and industrious, addicted to traffic, and particularly expert in the linen manufacture.

Repleve.

If a plaint in replevin be removed into the court of king's-bench, &c. and the plaintiff makes default and becomes non-suit, or judgment is given against him, the defendant in replevin shall have the writ of *reforme habendo* of the goods taken in distress. See the next article.

REPLEVY, in law, is a tenant's bringing a writ of replevin, or *replegiari facias*, where his goods are taken by distress for rent; which must be done within five days after the distress, otherwise at the five days end they are to be appraised and sold.

This word is also used for bailing a person, as in the case of a *homine replegiando*.

REPORT, the relation made upon oath, by officers or persons appointed to visit, examine, or estimate the state, expences, &c. of any thing.

REPORT, in law, is a public relation of cases judicially argued, debated, resolved, or adjudged in any of the king's courts of justice, with the causes and reasons of the same, as delivered by the judges. Also when the court of chancery, or any other court, refers the stating of a case, or the comparing of an account, to a master of chancery, or other referee, his certificate thereon is called a *report*.

REPOSE, in poetry, &c. the same with rest and pause. See REST, &c.

REPOSE, in painting, certain masses or large assemblages of light and shade, which being well conducted, prevent the confusion of objects and figures, by engaging and fixing the eye so as it cannot attend to the other parts of the painting for some time; and thus leading it to consider the several groups gradually, proceeding as it were from stage to stage.

REPRESENTATION, in the drama, the exhibition of a theatrical piece, together with the scenes, machinery, &c.

REPRESENTATIVE, one who personates or supplies the place of another, and is invested with his right and authority. Thus the house of commons are the representatives of the people in parliament. See COMMONS and PARLIAMENT.

REPRIEVE, in criminal law (from *reprendre*, "to take back"), is the withdrawing of a sentence for an interval of time; whereby the execution is suspended. See JUDGMENT.

This may be, first, *ex arbitrio judicis*, either before or after judgment: as, where the judge is not satisfied with the verdict, or the evidence is suspicious, or the indictment is insufficient, or he is doubtful whether the offence be within clergy; or sometimes if it be a small felony, or any favourable circumstances appear in the criminal's character, in order to give room to apply to the crown for either an absolute or conditional pardon. These arbitrary reprieves may be granted or taken off by the justices of gaol-delivery, although their session be finished, and their commission expired: but this rather by common usage than of strict right.

Reprieves may also be *ex necessitate legis*: as where a woman is capitally convicted, and pleads her pregnancy. Though this is no cause to stay judgment, yet it is to respite the execution till she be delivered. This is a mercy dictated by the law of nature, *in favorem proli*; and therefore no part of the bloody proceedings in the reign of Queen Mary hath been more justly detested, than the cruelty that was exercised in the island of

Repleve.

Guernsey, of burning a woman big with child; and, when through the violence of the flames the infant sprang forth at the stake, and was preserved by the bystanders, after some deliberations of the priests who assisted at the sacrifice, they cast it into the fire as a young heretic. — A barbarity which they never learned from the laws of ancient Rome; which direct, with the same humanity as our own, *quod pregnantis mulieris damnata pena differatur, quoad pariat*: which doctrine has also prevailed in England; as early as the first memorials of our law will reach. In case this plea be made in stay of execution, the judge must direct a jury of twelve men, or discreet women to inquire into the fact: and if they bring in their verdict *quick with child* (for bare pregnancy, unless it be alive in the womb, is not sufficient), execution shall be staid generally till the next session; and so from session to session, till either she is delivered, or proves by the course of nature not to have been with child at all. But if she once hath had the benefit of this reprieve, and being delivered, and afterwards becomes pregnant again, she shall not be entitled to the benefit of a further reprieve for that cause. For she may now be executed, though she is quick in the womb; and shall not be able to evade the sentence of death.

Another cause of reprieve is, where the offender become *non compos* before the award of execution: for regularly, though he be *compos* when he commits a capital crime, and becomes *non compos* after, he shall not be excused after indictment, he shall not be convicted, if after conviction he shall not receive judgment; if after judgment, he shall not be ordered for execution: for *non compos pro reo puniatur*; and the law knows not but he may have offered some reason, if in his senses, to have been in his respective proceedings. It is therefore an established rule, when any time intervenes between the indictment and the award of execution, as demanded of the prisoner what he hath to allege why execution shall not be awarded against him; and, if he appears to be insane, the judge in his discretion may and ought to reprieve him. Or, the party may plead in bar of execution; which plea may be either pregnancy, the king's pardon, an act of grace, or diversity of person; viz. that he is not the same that was attainted, and the like. In this last case a jury shall be impanelled to try this collateral issue, namely, the identity of his person, and not whether guilty or innocent, for that has been decided before. And in these collateral issues the trial shall be *instant*, and no time allowed the prisoner to make his defence, or produce his witnesses, unless he will make oath that he is not the person attainted: neither shall any peremptory challenges of the jury be allowed the prisoner, though formerly such challenges were held to be allowable whenever a man's life was in question. If neither pregnancy, insanity, non-identity, nor other plea, will avail to avoid the judgment, and stay the execution consequent thereupon, the last and surest resort is in the king's most gracious pardon; the granting of which is the most amiable prerogative of the crown. See the article PARDON.

REPRISALS, a right which princes claim of taking from their enemies any thing equivalent to what they unjustly detain from them or their subjects. For as the delay of making war may sometimes be detrimental

Comment.

Reprisal.  
Blackst.  
Comment.

mental to individuals who have suffered by depredations from foreign potentates, our laws have in some respects armed the subject with powers to impel the prerogative: by directing the ministers of the crown to issue letters of marque and reprisal upon due demand: the prerogative of granting which is nearly related to, and plainly derived from, that other of making war, this being indeed only an incomplete state of hostility, and generally ending in a formal denunciation of war. These letters are grantable by the law of nations, whenever the subjects of one state are oppressed and injured by those of another; and justice is denied by that state to the oppressor belongs. In this case letters of reprisal, and reprisal, words used as synonymous, and signifying, the latter a taking in return, the former the seizure of the frontiers, in order to such taking, may be obtained in order to seize the bodies or goods of the subjects of the offending state, until satisfaction be made, wherever they happen to be found. And indeed this custom of reprisals seems to have been anciently used, for which reason we find in the last century times very notable instances of it. But now the necessity is obvious of calling in the law to assist, to determine when reprisals may be made, and to what private sufferer would be a remedy in the law. In pursuance of which, a statute is made, 4 Hen. V. c. 5. which directs, that if any of the realm are oppressed in their persons or goods by foreigners, the king will grant letters of reprisal, in all that feel themselves grieved. Which form is thus directed to be observed: the sufferer must first apply to the lord privy-seal, and he shall give him a writ under the privy-seal; and if after that writ satisfaction made, the party required to make satisfaction shall make due satisfaction or not, then the lord-chancellor shall give him a writ under the great seal; and if he does not, he may attack and seize the property of the offender or nation, without hazard of being condemned as a robber or pirate.

**Reprisal, or Recaption,** is a species of remedy allowed to an injured person. This happens when any one hath deprived another of his property in goods or chattels personal, or wrongfully detained one's wife, child, or servant: in which case the owner of goods, and the husband, parent, or master, may lawfully claim and retake them, wherever he happens to find them; so it be not in a riotous manner, or attended with a breach of the peace. The reason for this is, obviously, that it may frequently happen that the owner may have the only opportunity of doing himself justice, as his goods may be afterwards conveyed away or sold, and his wife, children, or servants, concealed or carried out of his reach; if he had no speedier remedy than the ordinary process of law. If therefore he can so contrive it as to gain possession of his property again, without force or terror, the law favours and will justify his proceeding. But, as the public peace is a superior consideration to any one man's private property; and as, if individuals were once allowed to use private force as a remedy for private injuries, all social justice must cease, the strong would give law to the weak, and every man would revert to a state of nature; for these reasons it is provided, that this natural right of recaption shall never be exerted, where such exertion must occasion strife and bodily contention, or endanger

the peace of society. If, for instance, my horse is taken away, and I find him in a common, a fair, or a public inn, I may lawfully seize him to my own use; but I cannot justify breaking open a private stable, or entering on the grounds of a third person, to take him, except he be feloniously stolen; but must have recourse to an action at law.

**REPROBATION**, in theology, means the act of abandoning, or state of being abandoned, to eternal destruction, and is applied to that decree or resolve which God has taken from all eternity to punish sinners who continue in impenitence; in which sense it is directly opposed to election. When a sinner is so hardened as to be without remorse or misgiving of conscience, it is considered as a sign of reprobation; which by the casuists has been distinguished into positive and negative. The first is that whereby God is supposed to create men with a positive and absolute resolution to damn them eternally. This opinion is countenanced by St Augustine and other Christian fathers, and is a peculiar tenet of Calvin and most of his followers. The church of England, in *The thirty-nine Articles*, teaches something like it; and the church of Scotland, in the *Confession of Faith*, maintains it in the strongest terms. But the notion is generally exploded, and is believed by no rational divine in either church, being totally injurious to the justice of the Deity. Negative or conditional reprobation is that whereby God, though he has a sincere desire to save man, and furnishes them with the necessary means, so that all if they will may be saved, yet sees that there are many who will not be saved by the means, however powerful, that are afforded them; though by other means which the Deity sees, but will not afford them, they might be saved. Reprobation respects angels as well as men, and respects the latter either fallen or unfallen. See **PREDDESTINATION**.

**REPRODUCTION**, is usually understood to mean the restoration of a thing before existing, and since destroyed. It is very well known that trees and plants may be raised from slips and cuttings; and some late observations have shown, that there are some animals which have the same property. The polype was the first instance we had of this; but we had scarce time to wonder at the discovery Mr Trembley had made, when Mr Bonett discovered the same property in a species of water-worm. Amongst the plants which may be raised from cuttings, there are some which seem to possess this quality in so eminent a degree, that the smallest portion of them will become a complete tree again.

It deserves inquiry, whether or not the great Author of nature, when he ordained that certain insects, as these polypes and worms, should resemble those plants in that particular, allowed them this power of being reproduced in the same degree? or, which is the same thing, whether this reproduction will or will not take place in whatever part the worm is cut? In order to try this, Mr Bonett entered on a course of many experiments, on the water-worms which have this property. These are, at their common growth, from two to three inches long, and of a brownish colour, with a cast of reddish. From one of these worms he cut off the head and tail, taking from each extremity only a small piece of a twelfth of an inch in length; but neither of these pieces were able to reproduce what was wanting. They both perished, in about 24 hours; the tail first,

Reprobation.  
Reproduction.

**Reproduction.** and afterwards the head. As to the body of the worm from which these pieces were separated, it lived as well as before, and seemed indeed to suffer nothing by the loss, the head part being immediately used as if the head was thereon, boring the creature's way into the stick. There are, besides this, two other points in which the reproduction will not take place; the one of these is about the fifth or sixth ring from the head, and the other at the same distance from the tail; and in all probability the condition of the great artery in these parts is the cause of this.

What is said of the want of the productive power of these parts relates only to the heart and the vessels for as to the body, it feels very little inconvenience from the loss of what is taken off, and very speedily recovers those parts. Where then does the principle of life reside in such worms, which, after having their heads cut off, will have not only the same motions, but even the inclinations, that they had before? and yet this difficulty is very small, compared to several others which at the same time offer themselves to our reason. Is this wonderful reproduction of parts only a natural consequence of the laws of motion? or is there lodged in the body of the creature a chain of minute buds or shoots, a sort of little embryos, already formed and placed in such parts where the reproductions are to begin? Are these worms only mere machines? or are they, like more perfect animals, a sort of compound, the springs of whose motions are actuated or regulated by a sort of soul? And if they have themselves such a principle, how is it that this principle is multiplied, and is found in every separate piece? It is to be granted, that there are in these worms, not a single soul (if it is to be so called) in each, but that each contains as many souls as there are pieces capable of reproducing perfect animals? Are we to believe with Malpighi, that these sorts of worms are all heart and brain from the one end to the other? This may be; but yet if we knew that it was so, we should know in reality but very little the more for knowing it: and it seems, after all, that in cases of this kind we are only to admire the works of the Creator, and sit down in silence.

The nice sense of feeling in spiders has been much talked of by naturalists; but it appears that these worms have yet somewhat more surprising in them in regard to this particular. If a piece of stick, or any other substance, be brought near them, they do not fly for its touching them, but begin to leap and frisk about as soon as it comes towards them. There want, however, some farther experiments to ascertain whether this be really owing to feeling or to sight; for though we can discover no distinct organs of sight in these creatures, yet they seem affected by the light of the sun or a candle, and always frisk about it in the same manner at the approach of either; nay, even the moonlight has some effect upon them.

A twig of willow, poplar, or many other trees, being planted in the earth, takes root, and becomes a tree; every piece of which will in the same manner produce other trees. The case is the same with these worms: they are cut to pieces, and these several pieces become perfect animals; and each of these may be again cut into a number of pieces, each of which will in the same manner produce an animal. It had been supposed by some that these worms were oviparous; but Mr. Bo-

act; on cutting one of them to pieces, having observed a slender substance, resembling a small filament, to move at the end of one of the pieces, separated it, and on examining it with glasses, found it to be a perfect worm, of the same form with its parent, which lived and grew large in a vessel of water into which he put it. These small bodies are easily divided, and very readily complete themselves again, a day usually serving for the production of one head to the part that wants one; and, in general, the smaller and slenderer the worms are, the sooner they complete themselves after this operation. When the bodies of the large worms are examined by the microscope, it is very easy to see the appearance of the small worms alive, and moving about within them: and, with great precision and exactness to be certain of the place, since the ramifications of the great artery have been made the appearance of young worms, and they are kept in motion by the systoles and diastoles, and distributed to the several portions of the artery, which serve as so many hearts; it is very certain, that what we force is regard to this matter by our operations, is done almost entirely when, and in the, banks and ditches where they live. It is not possible to find in these places any other kind of worms, and some without either; and, in the several various kinds, all which live has not been observed to complete themselves: but whether retained in the same place in this state, or they have not been able to get out of their own body for the purpose of doing so, it is not easy to determine. They sometimes die in many accidents, by which they lose the several parts of their body, and must perish, unless they have a power of reproducing what was lost. They are broken into two pieces, by the stiffness of the mud, or a piece of mud which they enter, and the body is turned to a disease, a kind of gangrene, setting off several parts of their bodies, and must necessarily perish, had they not this surprising property.

This worm was a feared infection of the Egyptians, of the Cupriding power, in an animal, as it was the most essential part of the life. But it is not now so feared to have spoiled her beneficence. In this respect, as she is not wanted, Mr Bennett tried the same experiments upon this species of water-worm, differing from the former, by being much thicker. This kind of worm, when divided in the former fashion, very often turns the lower segments into little black ants, or four pieces, the pieces will lie like dead for a long time, but after, another worm grows again, and may be found in this state of the body, and a head, a tail, or both. After a long time, if left, they move very little; and, according to the gentleman's experiments, seldom live more than a month.

It should seem, that the more difficult success of this kind of worms, after cutting, and the long time it takes to recover the lost parts, if it do recover them at all, is owing to its thickness; since we always find, in that species of worms which succeeds best of all, that those which are thinnest always recover their parts much sooner than the others.

The water-insects also are not the only creatures which have this power of recovering their lost parts. The earth affords us some already discovered to grow in this manner from their cuttings, and these not less deserving our admiration than those of the water; the common

Reputation, with great force : but as to fire, light, and electricity, Request. our experiments fail; nay, the supposition of a repulsive power among the particles of the electric fluid is inconsistent with the phenomena, as has been demonstrated under the article ELECTRICITY, Sect. V. and VI. Even in those fluids, air and steam, where a repulsive power most manifestly exists, it is demonstrable that the repulsion cannot be a *primary* quality, since it can be increased to a great degree by heat, and diminished by cold : but it is impossible that a *primary* quality of matter can be increased or diminished by any external circumstances whatever; for whatever property depends upon external circumstances, is not a *primary* but a secondary one. The repulsion of electrified bodies is explained under the article ELECTRICITY: that of others is less subject to investigation; and the most that can be said concerning it is, that in many cases it seems to be the consequence of a modification of fire, and in others of electricity.

**REPUTATION** means credit, honour, or the character of good; and since we are destined to live in society, is necessary and useful more or less to every human being. There is no man, except one who is overgrown with pride and self-conceit, or whose actions are bad, but pays attention to his reputation, and wishes to possess the good opinion of his neighbours or the world. The love of reputation and of fame are most powerful springs of action; but though they proceed from the same principle, the means of attaining them, and the effects of them, are not altogether the same.

Many means indeed serve equally to support the reputation and to increase the fame, differing only in degrees; others, however, belong peculiarly either to the one or the other. An honest reputation is within the reach of the bulk of mankind; it is obtained by the social virtues and the constant practice of the common duties of life. This kind of reputation indeed is neither extensive nor brilliant, but it is often the most useful in point of happiness. Wit, talents, and genius, are the necessary requisites for fame; but those advantages are perhaps less real in their consequences than those arising from a good reputation. What is of real use costs little; things rare and splendid require the greatest labour to procure, and yield perhaps a more ideal happiness.

Fame can be possessed, comparatively speaking, but by few individuals; as it requires either very superior abilities, supported by great efforts, or very fortunate circumstances. It is constituted by the applause of mankind, or at least by that of a single nation; whilst reputation is of much less extent, and arises from different circumstances. That reputation which is founded on deceit and artifice is never solid; and the most honourable will always be found to be the most useful. Every one may safely, and indeed ought to, aspire to the consideration and praise due to his condition and merit; but he who aspires to more, or who seeks it by dishonest means, will at length meet with contempt.

**REQUEST**, in law, a supplication or petition preferred to a prince, or to a court of justice; begging relief in some conſiderable caſes where the common law grants no immediate redreſs.

*Court of Requests* (*curia requisitionum*) was a court of equity, of the same nature with the court of chancery, but inferior to it; principally instituted for the relief of such petitioners as in conscionable cases address-

ed themselves by supplication to his majesty. Of this court the lord privy seal was chief judge, assisted by the masters of requests; and it had beginning about the 9 Hen. VII. according to Sir Julius Caesar's tractate upon this subject: though Mr Gwyn, in his preface to his Readings, saith it began from a commission first granted by King Henry VIII. This court, having assumed great power to itself, so that it became burdensome, *Stat. 40 and 41 Eliz.* in the court of common-pleas it was adjudged upon solemn argument, *that the court of requests was no court of judicature*, and by *Stat. 16 & 17 Car. I. c. 10.* it was

There are still courts of requests, or courts of conscience, constituted in London and other trading and mercantile districts for the recovery of small debts. The first of these was established in London so early as the reign of Henry VIII. by an act of their common council, which however was certainly insufficient for that purpose, and illegal, till confirmed by statute 3 Jac. I. c. 15. which has since been confirmed and amended by statute 14 Geo. II. c. 12. The jurisdiction is thus: two aldermen and two common councilmen, or one of them, may hear all causes of debt not exceeding the value of forty shillings; which they examine in a summary way, by the oath of the parties or their witnesses, and make such order therein as is consistent to equity and good conscience. The time and expense of obtaining this summary redress are very inconsiderable, which must be a great benefit to trade; and therefore several trading towns and other districts have obtained acts of parliament for establishing in their courts of requests nearly the same plan as that in the city of London.

By 25 Geo. III. c. 45. (which is confined to imprisonments in courts of conscience in London, Westminster, and the borough of Southwark), and by 22 Geo. III. c. 38. (which extends the provisions of the former act to all other courts instituted for the recovery of small debts), it is enacted; That after the first day of September 1786, no person whatsoever, being a debtor or defendant, and who has been or shall be committed to any gaol or prison by order of any court or commissioners authorized by any act or acts of parliament for constituting or regulating any court or courts for the recovery of small debts, where the debt does not exceed twenty shillings, shall be kept or continued in custody, on any pretence whatsoever, more than twenty days from the commencement of the last mentioned act; or from the time of his act or their commitment to prison: and where the debt or debts do not amount to or exceed the sum of twenty shillings, more than forty days from the commencement of the said act; or from the time of his, her, or their commitment as aforesaid; and all gaolers and sheriffs are thereby required to discharge such persons accordingly. And by sect. 2. if it shall be proved to the satisfaction of the court, that any such debtor has money or goods which he has wilfully and fraudulently concealed: in that case the court shall have power to enlarge the aforesaid times of imprisonment for debts under twenty shillings, to any time not exceeding thirty days, and for debts under forty shillings, to any time not exceeding sixty days; which said ground of farther detention shall be specified in the said commitment. And that (by sect. 3.) at the expiration of the said respective times of imprisonment, every such person shall immediately be discharged, without paying any sum of

*Requiem*  
*Reseda* money, or other reward or gratuity whatsoever, to the gaoler of such gaol on any pretence whatsoever; and every gaoler demanding or receiving any fee for the discharge of any such person, or keeping any such person prisoner after the said respective times limited by the said act, shall forfeit five pounds, to be recovered in a summary way before two justices of the peace, one moiety thereof to be paid to the overseers of the poor of the parish where the offence shall be committed, and the other to the informer.

**REQUIEM**, in the Romish history, a mass sung for the rest of the soul of a person deceased.

**RESCISSION**, in the civil law, an action intended for the annulling or setting aside any contract.

**RESCRIPT**, an answer delivered by an emperor or a pope, when consulted by particular persons on some difficult question or point of law, to serve as a decision thereof.

**RESEDA**, DYER'S WEED, *Yellow-weed*, *Weld*, or *Wild-weed*; A greenish herb, the order of trigynæ, belonging to the dodecandry class of plants, and in the natural method ranking under the sixth order, *Miscellaneæ*. The plant is a slender stem and sterile; the petals lanceolate, the leaves alternate, and opening at the mouth. The flowers are small, of which the most remarkable is the common dyer's weed, growing in many parts of Britain. The young leaves are often uncoloured; the stalk is a hard light green, terminated with a long naked spike of yellow-green flowers: the plant is cultivated and used for dyeing silk and wool of a yellow colour. The recommendation of the plant is, that it will grow very little trouble, without dung, and on the most barren soil. For this reason it is commonly sown in the corn, after barley or oats, without any other care, except drawing a hush over it to harrow it. The seed of the corn does it little or no hurt, as it grows well the first year, and the next summer it is pulled and dried like flax. Much care and nicety, however, is requisite, so as not to injure either the seed or stalk; or, which sometimes happens, damaging both, by letting it stand too long, or pulling it too green. To avoid these inconveniences, a better method of culture has been devised. This new method is to plough and harrow the ground very fine, without dung, as equally as possible, and then sowing about a gallon of seed, which is very small, upon an acre, some time in the month of August. In about two months it will be high enough to hoe, which must be carefully done, and the plants left about six inches asunder. In March it is to be mowed down, and this labour is to be repeated a third time in May. About the close of June, when the flower is in full vigour, and the stalk is become of a greenish-yellow, it should be pulled; a sufficient quantity of stems being left growing for seed till September. By this means the flower and stalk, both of them being carefully dried, will sell at a good price to the dyers, who employ it constantly, and in large quantities; add to this, that the seed being ripe and in perfect order, will yield a very considerable profit. In a tolerable year, when the seasons have not been unfavourable, the advantages derived from this vegetable will answer very well; but if the summer should be remarkably fine, and proper care is taken in getting it in, there will be

a very large produce upon an acre. The crop being, as has been shown, so early removed, the ground may be conveniently prepared for growing wheat the next year. Upon the whole, weld is in its nature a very valuable commodity in many respects, as it serves equally for woollen, linen, or silk; dyeing not only a rich and lasting yellow, but also, properly managed, all the different shades of yellow with brightness and beauty; and if these be previously dipped blue, they are by the weld changed into a very pleasing green, which our artists can also diversify into a great variety of shades.

**RESEMBLANCE**, and **DISSIMILITUDE**, the relations of likeness and difference among objects. See **COMPARISON**.

The connexion that man hath with the beings around him, requires some acquaintance with their nature, their powers, and their qualities, for regulating his conduct. For acquiring a branch of knowledge so essential to our well-being, motives alone of reason and interest are not sufficient: nature hath providentially superadded curiosity, a vigorous propensity, which never is at rest. This propensity alone attaches us to every new object; and incites us to compare objects, in order to discover their differences and resemblances. *Elem. of Criticism*

Resemblance among objects of the same kind, and dissimilitude among objects of different kinds, are too obvious and familiar to gratify our curiosity in any degree: its gratification lies in discovering differences among things where resemblance prevails, and resemblances where difference prevails. Thus a difference in individuals of the same kind of plants or animals, is deemed a discovery, while the many particulars in which they agree are neglected; and in different kinds, any resemblance is greedily remarked, without attending to the many particulars in which they differ.

A comparison of the former neither tends to gratify our curiosity, nor to set the objects compared in a stronger light: two apartments in a palace, similar in shape, size, and furniture, make separately as good a figure as when compared; and the same observation is applicable to two similar compartments in a garden: on the other hand, oppose a regular building to a fall of water, or a good picture to a towering hill, or even a little dog to a large horse, and the contrast will produce no effect. But a resemblance between objects of different kinds, and a difference between objects of the same kind, have remarkably an enlivening effect. The poets, such of them as have a just taste, draw all their similes from things that in the main differ widely from the principal subject; and they never attempt a contrast, but where the things have a common genus, and a resemblance in the capital circumstances: place together a large and a small-sized animal of the same species, the one will appear greater, the other less, than when viewed separately: when we oppose beauty to deformity, each makes a greater figure by the comparison. We compare the dress of different nations with curiosity, but without surprise; because they have no such resemblance in the capital parts as to please us by contrasting the smaller parts. But a new cut of a sleeve, or of a pocket, enchants by its novelty; and, in opposition to the former fashion, raises some degree of surprise.

That resemblance and dissimilitude have an enlivening

*Resemblance*

ing effect upon objects of sight, is made sufficiently evident; and that they have the same effect upon objects of the other senses, is also certain. Nor is that law confined to the external senses; for characters contrasted make a greater figure by the opposition: Iago, in the tragedy of Othello, says,

He hath a daily beauty in his life  
That makes me ugly.

The character of a sop, and of a rough sea, are nowhere more successfully contrasted than in *Shakespeare*:

*Holspur.* My liege, I did deny no prisoners:  
But I remember, when the fight was done;  
When I was dry with rage, and extreme toil,  
Breathless and faint, leaning upon my sword,  
Came there a certain lord, neat, trimly dress'd,  
Fresh as a bridegroom; and his chin, new-ress'd,  
Show'd like a stubble-land at harvest-home.  
He was perfum'd like a milliner;  
And 'twixt his finger and his thumb he held  
A pouncet-box, which ever and anon  
He gave his nose:—and still he smil'd and talk'd;  
And as the soldiers bare dead bodies by,  
He call'd them untaught knaves, unmannerly,  
To bring a slovenly unhandsome coife  
Betwixt the wind and his nobility.  
With many holiday and lady terms  
He question'd me: among the rest, demanded  
My pris'ners, in your majesty's behalf.  
I then, all smarting with my wounds; being gall'd  
To be so pester'd with a popinjay,  
Out of my grief, and my impatience,  
Answer'd, neglectingly, I know not what:  
He should, or should not; for he made me mad,  
To see him shine so brisk, and smell so sweet,  
And talk so like a waiting gentlewoman,  
Of guns, and drums, and wounds, (God save the mark!)  
And telling me, the sovereign'st thing on earth  
Was parmacuity for an inward bruise;  
And that it was great pity, so it was,  
This villanous saltpetre should be digg'd  
Out of the bowels of the harmless earth,  
Which many a good, tall fellow had destroy'd  
So cowardly: and but for these vile guns,  
He would himself have been a soldier.

*First Part, Henry IV. A.C. I. Sc. 4.*

Passions and emotions are also inflamed by comparison. A man of high rank humbles the bystanders even to annihilate them in their own opinion: Caesar, beholding the statue of Alexander, was greatly mortified, that now, at the age of 32, when Alexander died, he had not performed one memorable action.

Our opinions also are much influenced by comparison. A man whose opulence exceeds the ordinary standard is reputed richer than he is in reality; and wisdom or weakness, if at all remarkable in an individual, is generally carried beyond the truth.

The opinion a man forms of his present distress is heightened by contrasting it with his former happiness:

Could I forget  
What I have been, I might the better bear  
What I'm destin'd to. I'm not the first

That have been wretched: but to think how much  
I have been happier.

*Southern's Innocent Adultery, A.C. II.*

The distress of a long journey makes even an indifferent inn agreeable: and, in travelling, when the road is good, and the horseman well covered, a bad day may be agreeable, by making him sensible how snug he is.

The same effect is equally remarkable, when a man compares his condition to that of others. A ship tossed in a storm, makes the spectator reflect upon the usual and security, and puts these in the strongest contrast.

Grief cannot bear mirth; it gives him a portion of his unhappiness, and of course diminishes his mirth. Satan, contemplating the beauties of the terrestrial paradise, has the following exclamations:

With what delight could I have walk'd these round,  
If I could joy to find here  
Of hill and valley, trees, and flowers,  
Now land, now sea, and rocks, and caves,  
Rocks, dens, and caves, and caves,  
Find place of springs, and place of fountains,  
Pleasures about me, and pleasures  
Torment within me, and pleasures  
Of contraries: all good, all bad,  
Bane, and in heav'n a much more bitter.

*Paradise Lost, Book IV.*

The appearance of danger, even when it is sometimes pain. A timorous person, standing on the battlements of a high tower, is less affected by the consciousness of security, than one who stands on one of a firm bank; this situation, however, is the appearance of danger heightens the consciousness of security, and consequently the satisfaction that arises from security: but the satisfaction that above-mentioned, and consequently the satisfaction that arises from security.

The effect of magnifying or diminishing objects by means of comparison is to be attributed to the influence of passion over our opinions. This will evidently appear by reflecting on what manner a spectator is affected, when a very large animal is for the first time placed beside a very small one of the same species. The first thing that strikes the mind is the difference between the two animals, which is so great as to occasion surprise; and this, like other passions, magnifying its objects, makes the difference to be the greatest that can be perceived, or seem to see, the one animal extremely small, and the other extremely large. The emotion of surprise arising from any unusual resemblance, serves equally to explain, why at first view we are apt to think such resemblance more entire than it is in reality. And it must be observed, that the circumstances of more and less, which are the proper subjects of comparison, raise a perception so indistinct and vague as to facilitate the effect described; we have no mental standard of great and little, nor of the several degrees of any attribute; and the mind, thus unrestrained, is naturally disposed to indulge its surprise to the utmost extent.

In exploring the operations of the mind, some of which are extremely nice and slippery, it is necessary to

Re-  
semblance.

ciple over and above is necessary to excite our industry, and to prevent our stopping short in the middle of the course.

We need not lose time to describe the co-operation of the foregoing propensity with surprise, in producing the effect that follows any unusual resemblance or dissimilitude. Surprise first operates, and carries our opinion of the resemblance or dissimilitude beyond truth. The propensity we have been describing, carries us still farther; for it forces upon the mind a conviction, that the resemblance or dissimilitude is complete. We need no better illustration, than the resemblance that is fancied in some pebbles to a tree or an insect, which resemblance, however faint in reality, is conceived to be wonderfully perfect. The tendency to complete a resemblance acting jointly with surprise, carries the mind sometimes so far, as even to presume upon future events. In the Greek tragedy entitled *Phinides*, those unhappy women seeing the place where it was intended they should be slain, cried out with anguish, "They now saw their cruel destiny had condemned them to die in that place, being the same where they had been exposed in their infancy."

Arist. Poet.  
cap. 17.

The propensity to advance every thing to its perfection, not only co-operates with surprise to deceive the mind, but of itself is able to produce that effect. Of this we see many instances where there is no place for surprise; and the first we shall give is of resemblance. *Unumquodque eodem modo dissolvitur quo colligatum est*, is a maxim in the Roman law that has no foundation in truth; for tying and loosing, building and demolishing, are acts opposite to each other, and are performed by opposite means: but when these acts are connected by their relation to the same subject, their connexion leads us to imagine a sort of resemblance between them, which by the foregoing propensity is conceived to be as complete as possible. The next instance shall be of contrast. Addison observes, "That the paler features look the most agreeable in white; that a face which is overflushed appears to advantage in the deepest scarlet; and that a dark complexion is not a little alleviated by a black hood." The foregoing propensity serves to account for these appearances; to make this evident, one of the cases shall suffice. A complexion, however dark, never approaches to black: when these colours appear together, their opposition strikes us; and the propensity we have to complete the opposition, makes the darkness of complexion vanish out of sight.

Spectator,  
Nº 205.

The operation of this propensity, even when there is no ground for surprise, is not confined to opinion or conviction; so powerful it is, as to make us sometimes proceed to action, in order to complete a resemblance or dissimilitude. If this appear obscure, it will be made clear by the following instance. Upon what principle is the *lex talionis* founded; either that we make the punishment resemble the mischief, or that it intimates, that there ought to be a conformity or resemblance between a crime and its punishment; and the foregoing propensity impels us to make the resemblance as complete as possible. Titus Livius, under the influence of that propensity, accounts for a certain punishment by a resemblance between it and the crime, too subtle for common apprehension. Speaking of

Lib. 1.  
§ 28.Re-  
semblance.

Mettus Fefetius, the Alban general, who, for treachery to the Romans his allies, was sentenced to be torn to pieces by horses, he puts the following speech in the mouth of Tullus Hostilius, who decreed the punishment. "*Mette Fuffeti, inquit, si ipse discere posses fidem ac fœdera servare, vivo tibi ea disciplina à me adhibita esset. Nunc, quoniam tuam insanabile ingenium est, at tu tuo supplicio doce huminum genus ea sancta credere, que distulata sunt. Ut igitur paulo ante animum inter Fidenienses Romanamque rem ancipitem gessisti, ita jam corpus tuum in supplicium dabis.*" By the same influence, the same scene is often executed upon the very spot where the crime was committed. In the *Elektra* of Sophocles, Elektra is dragged from the theatre into an inner room of the supposed palace, to suffer death where her murdered Agamemnon. Shakspeare, whose knowledge of human nature is profound than extensive, has not overlooked this propensity.

"*Othello.* Get me some poison, Iago, this night. I'll not expostulate with her, lest her body and her beauty unprovide me with a weapon. Come, Iago."

"*Iago.* Do it with this. Will you be in bed, even in the bed she shall so soon come to bed with?"

"*Othello.* Good. Give it to me. Iago, I am very good."

Persons in their last moments are often seized with an anxiety to be buried with their fathers. In the *Amynta* of Tasso, the lover Amynta, who was torn to pieces by a wolf, is buried with his father, who was torn to pieces by a wolf.

Upon the subject of ground, we have already said too entire, hath no effect, however different the things compared may be. The resemblance is confined to works of art only; for natural objects of different kinds have scarce ever an exact resemblance to each other. An example in a work of art, however, is very different from what composition, marble, and marble cut into a human figure, produces great pleasure by the resemblance to a marble statue, he is so- loured like a statue, the resemblance is for the most part, a disaffected one, the statue appears real person, we discover the marble when we approach, and no other emotion is excited; but surprise occasioned by the deception, the figure still appears a real person, rather than an imitation, and we must use reflection to correct the mistake. This cannot happen in a picture; for the resemblance, when we see it, is so perfect, as to disguise the imitation.

The foregoing propensity belongs to contrast. Emotions, when they succeed each other in succession, but then the succession ought neither to be rapid, nor too slow; if too slow, the effect of contrast is lost; if too rapid, the distance of the emotions; and if rapid, a single emotion has room to expand itself to its full force, but is stifled, as it were, in the birth by a succeeding emotion. The funeral oration of the bishop of Meaux upon the duchess of Orleans, is a perfect hodge-podge of cheerful and melancholy representations, following each other in the quickest succession; opposite emotions are best felt in succession; but each emotion separately should be raised to its due pitch, before another be introduced.

What

Resemblance

What is above laid down, will enable us to determine a very important question concerning emotions raised by the fine arts, viz. Whether ought similar emotions to succeed each other, or dissimilar? The emotions raised by the fine arts are for the most part too nearly related to make a figure by resemblance; and for that reason their succession ought to be regulated as much as possible by contrast. This holds confessedly in epic and dramatic compositions; and the best writers, led perhaps by taste more than by reason, have generally aimed at that beauty. It holds equally in music: in the same cantata all the various emotions that are within the power of music, may not be indulged, but, to make the greatest figure, they must be contrasted. In gardening, there is the same reason for the rule: the emotions raised by the objects are at best so faint, that every artificial beauty is employed to give them their true figure. A field may be laid out in grand, gay, wild, melancholy scenes; and when these are viewed in succession, grandeur ought to be contrasted with neatness, regularity with wildness, and gay with melancholy, so as that each emotion may be distinguished: nay, it is an improvement in the succession, to introduce rude unimproved views, which in themselves are disagreeable, but in succession heighten the beauty of the objects; and we have nature for our example, which in her most beautiful landscapes, introduces the most disagreeable objects, dirty marshes, and the like. The greatest masters of music, in their compositions: the second part of a concerto, which conveys any sentiment: the second part of an opera, are purposely contrived to introduce the most interesting parts of the subject.

It is not to be comprehended under a single view, that the succession of objects is an embellishment. Dissimilar emotions, in different tones of mind; and the succession of objects, can never be pleasant: gay and melancholy may be combined, or wildness and grandeur; but a composition of gaiety and gloominess is disagreeable. The rude unimproved compartment of firs and brooms in Richmond garden, hath a good effect in the succession of objects; the contrast of that nature would be insupportable in the midst of a polished parterre or flower plot. A garden, that, for a great extent, admits not dissimilar emotions, and in ornamenting a small garden, the best composition confine it to a single expression. For the succession, a landscape ought also to be confined to a single expression; and accordingly, in a landscape painting, if the subject be gay, every figure ought to contribute to that emotion.

It follows from the foregoing train of reasoning, that a garden near a great city ought to have an air of solitude. The forsakenness, again, of a waste country ought to be contrasted in forming a garden; no temples, no obscure walks; but jets d'eau, cascades, objects gay, and splendid. Nay, such a garden should in some measure avoid imitating nature, by taking on an extraordinary appearance of regularity and art, to show the busy hand of man, which in a waste country has a fine effect by contrast.

Wit and ridicule make not an agreeable mixture

with grandeur. Dissimilar emotions have a fine effect in a slow succession; but in a rapid succession, which approaches to co-existence, they will not be relished. In the midst of a laboured and elevated description of battle, Virgil introduces a ludicrous image, which is certainly out of its place:

Obvius ambustum correm Chorineus ab ara  
Corripit, et venienti Ebufo plagamque ferenti  
Occupat os flammis: illi ingens barba reluxit,  
Nidorentique ambusta dedit. *Æn.* XII. 298.

È qual tauro fento, il suo dolore  
Vanto mugghiando e sospirando fuore.

*Gerusal. Cant.* IV. st. 1.

It would however be too austere to banish altogether ludicrous images from an epic poem. This poem doth not always soar above the clouds: it admits great variety; and upon occasion can descend even to the ground without sinking. In its more familiar tones, a ludicrous scene may be introduced without impropriety. This is done by Virgil\* in a foot race: the circumstances of which, not excepting the ludicrous part, are copied from Homer†. After a fit of merriment, we are, it is true, the less disposed to the serious and sublime: but then, a ludicrous scene, by unbending the mind from severe application to more interesting subjects, may prevent fatigue, and preserve our relish entire.

RESEN, (Moses); a town on the Tigris, built by Nimrod; thought to be the *Larissa* of Xenophon; which see. But as *Larissa* is a name in imitation of a Greek city; and as there were no Greek cities, consequently no *Larissa*, in Assyria, before Alexander the Great; it is probable that the Greeks asking of what city those were the ruins they saw, the Assyrians might answer, *Larsen*, "Of Resen;" which word Xenophon expressed by *Larissa*, a more familiar sound to a Greek ear, (Wells).

RESENTMENT, means a strong perception of good or ill, generally a deep sense of injury, and may be distinguished into *anger* and *revenge*. "By anger (says Archdeacon Paley), I mean the pain we suffer upon the receipt of an injury or affront, with the usual effects of that pain upon ourselves. By revenge, the inflicting of pain upon the person who has injured or offended us, farther than the just ends of punishment or reparation require. Anger prompts to revenge; but it is possible to suspend the effect when we cannot altogether quell the principle. We are bound also to endeavour to qualify and correct the principle itself. So that our duty requires two different applications of the mind; and for that reason anger and revenge should be considered separately." See REVENGE.

RESERVATION, in law, an action or clause whereby something is reserved, or secured to one's self. *Mental Reservation*, a proposition which, strictly taken, and according to the natural import of the terms, is false; but, if qualified by something concealed in the mind, becomes true.

Mental reservations are the great refuge of religious hypocrites, who use them to accommodate their consciences with their interests: the Jesuits are zealous advocates for mental reservations; yet are they real lies, as concluding an intention to deceive.

Resemblance  
+  
Reservation

Reserve  
Resin.

**RESERVE**, in law, the same with reservation. See **RESERVATION**.

*Body of RESERVE, or Corps de RESERVE*, in military affairs, the third or last line of an army, drawn up for battle; so called because they are reserved to sustain the rest as occasion requires, and not to engage but in case of necessity.

**RESERVOIR**, a place where water is collected and reserved, in order to be conveyed to distant places through pipes, or supply a fountain or jet d'eau.

**RESET**, in law, the receiving or harbouring an outlawed person. See **OUTLAWRY**.

*Reset of Theft*, in Scots law. See **LAW**, N° clxxxvi. 29.

**RESIDENCE**, in the canon and common law, the abode of a person or incumbent upon his benefice; and his assiduity in attending on the same.

**RESIDENT**, a public minister, who manages the affairs of a kingdom or state, at a foreign court.

They are a class of public ministers inferior to ambassadors or envoys; but, like them, are under the protection of the law of nations.

**RESIDUE**, the remainder or balance of an account, debt, or obligation.

**RESIGNATION**, in general, signifies the implicit submission of ourselves, or of something we possess, to the will of another. In a religious sense it signifies a perfect submission, without discontent, to the will of God. See **MORAL PHILOSOPHY**, N° 119.

**RESIN**, in natural history, a viscid juice oozing either spontaneously, or by incision, from several trees, as the pine, fir, &c.—A premium for several years has been offered by the London Society for Encouraging Arts, &c. for discovering a mode of reducing the inflammable quality of resin, so as to adapt it to the purposes of making candles; but no such discovery has yet been made.

*Elastic RESIN*. See **CAOUTCHOUC**.

*Gum RESIN*, a mixture of gum and resin. See **PHARMACY**, N° 38.

*Red Gum RESIN*, is procured from the red gum tree, or eucalyptus resinifera; a tree so large and lofty as to exceed in size the English oak. The wood of the tree is brittle, and of little use but for firewood, from the large quantity of resinous gum it contains. The tree is distinguished by having pedunculated flowers, and an acute or pointed conical alyptra. To obtain the juice from this tree incisions are made in the trunk of it, and sometimes upwards of 60 gallons of red resinous juice have been obtained from one of them. When this juice is dried, it becomes a very powerful astringent gum resin, of a red colour, much resembling that known in the shops by the name of *kino*, and, for all medical purposes, fully as efficacious. Mr White administered it to a great number of patients in the dysentery, which prevailed much soon after the landing of the convicts, and in no one instance found it to fail. This gum resin dissolves almost entirely in spirit of wine, to which it gives a blood-red tincture. Water dissolves about one-sixth part only, and the watery solution is of a bright red. Both these solutions are powerfully astringent.

*Yellow Gum RESIN*, is procured from the yellow resin tree, which is as large as the English walnut tree. The properties of this resin are equal to those of the

most fragrant balsams. It exudes from the bark spontaneously, but more readily if incisions are made. The colour of it is yellow, and at first it is fluid; but after being inspissated in the sun, it becomes solid. When burnt on hot coals, it smells like a mixture of balsam of Tolu and benzoin, approaching somewhat to storax.

“It is perfectly soluble in spirit of wine, but not in water, nor even in essential oil of turpentine, unless it be digested in a strong heat. The varnish which it makes with either is very weak, and of little use. With respect to its medicinal qualities, Mr White has found in many cases, a good pectoral medicine, and very balsamic. It is not obtainable in so great abundance as the red gum produced by the eucalyptus resinifera. The plant which produces the yellow gum seems to be perfectly unknown to botanists, but Mr White has communicated no specimens by which its genus or even class could be determined.”

**RESINOUS LACTACIDITY**, is that kind of electricity which is produced by existing bodies of the resinous kind, and which is generally negative. See **ELECTRICITY**, *passim*.

**RESISTANCE**, or *Resistive Force*, in philosophy, denotes, in general, any power which acts in an opposite direction to another, so as to destroy or diminish its effect. See **Mechanics**, **Hydrostatics**, and **PNEUMATICS**.

Of all the resistances of bodies to each other, there is no importance doubtably none of greater importance than the resistance or reaction of fluids. It is here that we must look for a theory of naval architecture, for the impulse of the air is our moving power, and this must be modified so as to produce our motion, or, by the form and disposition of our vessels, and it is the resistance of the water which must be overcome, that the ship may proceed in her intended course; this must also be modified to our purpose, and the ship may not drive like a log to leeward, but the contrary may ply to windward, that she may anchor her helm briskly, and that she may be easy in all her motions on the surface of the troubled ocean. The impulse of wind and water makes them ready and indefatigable servants in a thousand shapes for driving our machines; and we should lose much of their service did we remain ignorant of the laws of their action: they would sometimes become terrible masters, if we did not fall upon methods of eluding or softening their attacks.

We cannot refuse the ancients a considerable knowledge of this subject. It was equally interesting to them as to us, and we cannot read the accounts of the naval exertions of Phœnicia, Carthage, and of Rome, exertions which have not been surpassed by any thing of modern date, without believing that they possessed much practical and experimental knowledge of this subject. It was not, perhaps, possessed by them in a strict and systematic form, as it is now taught by our mathematicians; but the master builders, in their dockyards, did undoubtedly exercise their genius in comparing the forms of their finest ships, and in marking those circumstances of form and dimension which were in fact accompanied with the desirable properties of a ship, and thus framing to themselves maxims of naval architecture in the same manner as we do now. For we believe

Resinous,  
Resistance.

White's  
Voyage,  
Appendix.

**Resistance** believe that our naval architects are not disposed to grant that they have profited much by all the labours of the mathematicians. But the ancients had not made any great progress in the physico-mathematical sciences, which consist chiefly in the application of calculus to the phenomena of nature. In this branch they could make none, because they had not the means of investigation. A knowledge of the motions and actions of fluids is accessible only to those who are familiarly acquainted with the fluxionary mathematics; and without this key there is no admittance. Even when possessed of this guide, our progress has been very slow, hesitating, and devious; and we have not yet been able to establish any set of doctrines which are susceptible of an easy and confident application to the arts of life. If we have advanced farther than the ancients, it is because we have come after them, and have profited by their labours, and even by their mistakes.

3  
But even now it is not perfectly understood.

4  
Sir I. Newton first applied mathematics to it. Sir Isaac Newton was the first (as far as we can recollect) who attempted to make the motions and actions of fluids the subject of mathematical discussion. He had invented the method of fluxions long before he engaged in his physical researches, and he proceeded in these ~~for many years~~ <sup>for many years</sup>. Yet even with this guide he was often obliged to grope his way, and to vary variously by paths in the hopes of obtaining a legitimate theory. Having exerted all his powers in establishing a theory of the lunar motions, he was obliged to rest contented with an approximation instead of a perfect solution of the problem which ascertains the motions of those bodies mutually acting on each other. This convinced him that it was in vain to expect an accurate investigation of the motions and actions of fluids, where millions of unseen particles combine their influence. He therefore cast about to find some analogous case of the problem which would admit of approximate determination, and at the same time furnish the inducements of analogy or resemblance sufficiently numerous for giving limiting cases, which should include between them those other cases that did not admit of this accurate investigation. And thus, by knowing the limits to which the case proposed did approximate, and the circumstance which regulated the approximation, many useful propositions might be deduced for directing us in the application of these doctrines to the arts of life.

6  
He proposed a theory,

7  
which does not, however, agree with experiment;

He therefore figured to himself a hypothetical collection of matter which possessed the characteristic property of fluidity, viz. the ~~quadruple~~ <sup>quadruple</sup> propagation of pressure, and the most perfect immobility (upon the uncouth term) of parts, and which formed a physical whole or aggregate, whose parts were connected by mechanical forces, determined both in degree and in direction, and such as rendered the determination of certain important circumstances of their motion susceptible of precise investigation. And he concluded, that the laws which he should discover in these motions must have a great analogy with the laws of the motions of real fluids: And from this hypothesis he deduced a series of propositions, which form the basis of almost all the theories of the impulse and resistance of fluids which have been offered to the public since his time.

It must be acknowledged, that the results of this theory agree but ill with experiment, and that, in the way in which it has been zealously professed by subsequent

mathematicians, it proceeds on principles or assumptions which are not only gratuitous, but even false. But it affords such a beautiful application of geometry and calculus, that mathematicians have been as it were fascinated by it, and have published systems so elegant and so extensively applicable, that one cannot help lamenting that the foundation is so slimy. John Bernouilli's theory, in his dissertation on the communication of motion, and Bouguer's in his *Traité du Navire*, and in his *Theorie du Manœuvre et de la Mâture des Vaisseaux*, must ever be considered as among the finest specimens of physico-mathematical science which the world has seen.

And, with all its imperfections, this theory still furnishes (as was expected by its illustrious author) many propositions of immense practical use, they being the limits to which the real phenomena of the impulse and resistance of fluids really approximate. So that when the law by which the phenomena deviate from the theory is once determined by a well chosen series of experiments, this hypothetical theory becomes almost as valuable as a true one. And we may add, that although Mr d'Alembert, by treading warily in the steps of Sir Isaac Newton in another route, has discovered a genuine and unexceptionable theory, the process of investigation is so intricate, requiring every finess of the most abstruse analysis, and the final equations are so complicated, that even their most expert author has not been able to deduce more than one simple proposition (which too was discovered by Daniel Bernouilli by a more simple process) which can be applied to any use. The hypothetical theory of Newton, therefore, continues to be the groundwork of all our practical knowledge of the subject.

We shall therefore lay before our readers a very short view of the theory, and manner of applying it. We shall then show its defects (all of which were pointed out by its great author), and give an historical account of the many attempts which have been made to amend it or to substitute another: in all which we think it our duty to show, that Sir Isaac Newton took the lead, and pointed out every path which others have taken, if we except Daniel Bernouilli and d'Alembert; and we shall give an account of the chief sets of experiments which have been made on this important subject, in the hopes of establishing an empirical theory, which may be employed with confidence in the arts of life.

2  
We know by experience that force must be applied to a body in order that it may move through a fluid, such as air or water; and that a body projected with any velocity is gradually retarded in its motion, and generally brought to rest. The analogy of nature makes us imagine that there is a force acting in the opposite direction, or opposing the motion, and that this force resides in, or is exerted by, the fluid. And the phenomena resemble those which accompany the known resistance of active beings, such as animals. Therefore we give to this supposed force the metaphorical name of **RESISTANCE**. We also know that a fluid in motion will hurry a solid body along with the stream, and that it requires force to maintain it in its place. A similar analogy makes us suppose that the fluid exerts force, in the same manner as when an active being impels the body before him; therefore we call this the **IMPULSION** of a fluid. And as our knowledge of nature informs us that the mutual actions of bodies are in every

8  
but its utility is still very considerable.

The term resistance, as here applied, explained.

**Resistance.** every case equal and opposite, and that the observed change of motion is the only indication, characteristic, and measure, of the changing force, the forces are the same (whether we call them impulsions or resistances) when the relative motions are the same, and therefore depend entirely on these relative motions. The force, therefore, which is necessary for keeping a body immovable in a stream of water, flowing with a certain velocity, is the same with what is required for moving this body with this velocity through stagnant water. To any one who admits the motion of the earth round the sun, it is evident that we can neither observe nor reason from a case of a body moving through still water, nor of a stream of water pressing upon or impelling a quiescent body.

A body in motion appears to be resisted by a stagnant fluid, because it is a law of mechanical nature that force must be employed in order to put any body in motion. Now the body cannot move forward without putting the contiguous fluid in motion, and force must be employed for producing this motion. In like manner, a quiescent body is impelled by a stream of fluid, because the motion of the contiguous fluid is diminished by this solid obstacle; the resistance, therefore, or impulse, no way differs from the ordinary communications of motion among solid bodies.

Sir Isaac Newton, therefore, begins his theory of the resistance and impulse of fluids, by selecting a case where, although he cannot pretend to ascertain the motions themselves which are produced in the particles of a contiguous fluid, he can tell precisely their mutual ratios.

He supposes two systems of bodies such, that each body of the first is similar to a corresponding body of the second, and that each is to each in a constant ratio. He also supposes them to be similarly situated, that is, at the angles of similar figures, and that the homologous lines of these figures are in the same ratio with the diameters of the bodies. He farther supposes, that they attract or repel each other in similar directions, and that the accelerating connecting forces are also proportional; that is, the forces in the one system are to the corresponding forces in the other system in a constant ratio, and that, in each system taken apart, the forces are as the squares of the velocities directly, and as the diameters of the corresponding bodies, or their distances, inversely.

This being the case, it legitimately follows, that if similar parts of the two systems are put into similar motions, in any given instant, they will continue to move similarly, each correspondent body describing similar curves, with proportional velocities. For the bodies being similarly situated, the forces which act on a body in one system, arising from the combination of any number of adjoining particles, will have the same direction with the force acting on the corresponding body in the other system, arising from the combined action of the similar and similarly directed forces of the adjoining correspondent bodies of the other system; and these compound forces will have the same ratio with the simple forces which constitute them, and will be as the squares of the velocities directly, and as the distances, or any homologous lines inversely; and therefore the chords of curvature, having the direction of the centripetal or centrifugal forces, and similarly inclined to the tangents

of the curves described by the corresponding bodies, will have the same ratio with the distances of the particles. The curves described by the corresponding bodies will therefore be similar, the velocities will be proportional, and the bodies will be similarly situated at the end of the first moment, and exposed to the action of similar and similarly situated centripetal or centrifugal forces; and this will again produce similar motions during the next moment, and so on for ever. All this is evident to any person acquainted with the elementary doctrines of curvilinear motions, as delivered in the theory of physical astronomy.

From this fundamental proposition, it clearly follows, that if two similar bodies, having their homologous lines proportional to those of the two systems, be similarly projected among the bodies of those two systems with any velocities, they will produce similar motions in the two systems, and will themselves continue to move similarly; and therefore will, at every subsequent moment, suffer similar diminutions or augmentations. If the initial velocities of projection be the same, but the densities of the two systems, that is, the quantities of matter contained in an equal bulk or extent, be different, it is evident that the quantities of motion produced in the two systems in the same time will be proportional to the densities; and if the densities also be the same, and uniform in each system, the quantities of motion produced will be as the squares of the velocities, because the motion communicated to each corresponding body will be proportional to the velocity of the impelling body, and the number of similarly situated particles which will be struck will also be proportional to this velocity. Therefore, the whole quantities of motion produced in the same moment of time will be proportional to the squares of the velocities. And, lastly, if the densities of the two systems are uniform, or the same through the whole extent of the systems, the number of particles impelled by similar bodies will be as the surfaces of these bodies.

Now the diminutions of the motions of the projected bodies are (by Newton's third law of motion) equal to the motions produced in the systems; and these diminutions are the measures of what are called the resistances opposed to the motions of the projected bodies. Therefore, combining all these circumstances, the resistances are proportional to the similar surfaces of the moving bodies, to the densities of the systems through which the motions are performed, and to the squares of the velocities jointly.

We cannot form to ourselves any distinct notion of a fluid, other than as a system of small bodies, or a considered collection of particles, similarly or symmetrically arranged, the centres of each being situated in the angles of regular solids. We must form this notion of it, whether we suppose, with the vulgar, that the particles are little globules in mutual contact, or, with the partisans of corpuscular attractions and repulsions, we suppose the particles kept at a distance from each other by means of these attractions and repulsions mutually balancing each other. In this last case, no other arrangement is consistent with a quiescent equilibrium: and in this case, it is evident, from the theory of curvilinear motions, that the agitations of the particles will always be such, that the connecting forces, in actual exertion,

**Resistance.** will be proportional to the squares of the velocities directly, and to the chords of curvature having the direction of the forces inversely.

From these premises, therefore, we deduce, in the strictest manner, the demonstration of the leading theorem of the resistance and impulse of fluids; namely,

<sup>14</sup>  
First law of the resistance, &c. of fluids. PROP. I. The resistances, and (by the third law of motion), the impulsions of fluids on similar bodies, are proportional to the surfaces of the solid bodies, to the densities of the fluids, and to the squares of the velocities, jointly.

We must now observe, that when we suppose the particles of the fluid to be in mutual contact, we may either suppose them elastic or unelastic. The motion communicated to the collection of elastic particles must be double of what the same body, moving in the same manner, would communicate to the particles of an unelastic fluid. The impulse and resistance of elastic fluids must therefore be double of those of unelastic fluids.

<sup>15</sup>  
Elasticity of water. But we must caution our readers not to judge of the elasticity of fluids by their sensible compressibility. A diamond is incomparably more elastic than the finest football, though not compressible in any sensible degree. It appears to be denser, by well-chosen experiments, when water be makes elastic as air.

If we suppose, with Boyle, that the particles of perfect fluids to be at a distance from each other, we shall find it difficult to conceive a fluid void of elasticity. We hope that the theory of their repulsion and resistance will suggest experiments which will decide this question, by pointing out the means to find the absolute impulse of resistance to motion.

And thus the fundamental proposition of the impulse and resistance of fluids taken in its proper meaning is irreducible of a rigid demonstration, relating to the only notion that we can form of the internal constitution of a fluid. We say, taking it in its proper meaning; namely, that the impulse or resistance of fluids is a pressure, opposed and measured by another pressure, such as a pound weight, the force of a spring, the pressure of the atmosphere, and the like. And we apprehend that it would be very difficult to find any legitimate demonstration of this leading proposition different from this, which we have now borrowed from Sir Isaac Newton, Prop. 33. B. II. *Principia*.

We acknowledge that it is prolix and even circuitous; but in all the attempts made by his commentators and their copyists to simplify it, we see great defects of logical argument, or assumption of principles, which are not only gratuitous, but inadmissible. We shall have occasion, as we proceed, to point out some of these defects; and doubt not but the illustrious author of this demonstration had exercised his uncommon patience and sagacity in similar attempts, and was dissatisfied with them all.

Before we proceed further, it will be proper to make a general remark, which will save a great deal of discussion. Since it is a matter of universal experience, that every action of a body on others is accompanied by an equal and contrary re-action; and since all that we can demonstrate concerning the resistance of bodies during their motions through fluids proceeds on this supposition, (the resistance of the body being assumed as equal and opposite to the sum of motions communicated to the particles of the fluid, estimated in the direction of the bodies motion), we are entitled to proceed in the

contrary order, and to consider the impulsions which each of the particles of fluid exerts on the body at rest as equal and opposite to the motion which the body would communicate to that particle if the fluid were at rest, and the body were moving equally swift in the opposite direction. And therefore the whole impulsion of the fluid must be considered as the measure of the whole motion which the body would thus communicate to the fluid. It must therefore be also considered as the measure of the resistance which the body, moving with the same velocity, would sustain from the fluid. When, therefore, we shall demonstrate any thing concerning the impulsion of a fluid, estimated in the direction of its motion, we may consider it as demonstrated concerning the resistance of a quiescent fluid to the motion of that body, having the same velocity in the opposite direction. The determination of these impulsions being much easier than the determination of the motions communicated by the body to the particles of the fluid, this method will be followed in most of the subsequent discussions.

The general proposition already delivered is by no means sufficient for explaining the various important phenomena observed in the mutual actions of solids and fluids. In particular, it gives us no assistance in ascertaining the modifications of this resistance or impulse, which depend on the shape of the body and the inclination of its impelled or resisted surface to the direction of the motion. Sir Isaac Newton found another hypothesis necessary; namely, that the fluid should be so extremely rare that the distance of the particles may be incomparably greater than their diameters. This additional condition is necessary for considering their actions as so many separate collisions or impulsions on the solid body. Each particle must be supposed to have abundant room to rebound, or otherwise escape, after having made its stroke, without sensibly affecting the situations and motions of the particles which have not yet made their stroke; and the motion must be so swift as not to give time for the sensible exertion of their mutual forces of attractions and repulsions.

Keeping these conditions in mind, we may proceed to determine the impulsions made by a fluid on surfaces of every kind: And the most convenient method to pursue in this determination, is to compare them all either with the impulse which the same surface would receive from the fluid impinging on it perpendicularly, or with the impulse which the same stream of fluid would make when coming perpendicularly on a surface of such extent as to occupy the whole stream.

It will greatly abbreviate language, if we make use of a few terms in an appropriated sense. 16

By a *stream*, we shall mean a quantity of fluid moving in one direction, that is, each particle moving in parallel lines; and the *breadth* of the stream is a line perpendicular to all these parallels.

A *filament* means a portion of this stream of very small breadth, and it consists of an indefinite number of particles following one another in the same direction; and successively impinging on, or gliding along, the surface of the solid body.

The *base* of any surface exposed to a stream of fluid, is that portion of a plane perpendicular to the stream, which is covered or protected from the action of the stream by the surface exposed to its impulse. Thus the base of a sphere exposed to a stream of fluid is its great circle,

Resistance. circle, whose plane is perpendicular to the stream. If BC (fig. 1.) be a plane surface exposed to the action of a stream of fluid, moving in the direction DC, then BR, or SE, perpendicular to DC, is its base.

Plate  
CCCCXXVI

*Direct impulse* shall express the energy or action of the particle or filament, or stream of fluid, when meeting the surface perpendicularly, or when the surface is perpendicular to the direction of the stream.

*Absolute impulse* means the actual pressure on the impelled surface, arising from the action of the fluid, whether striking the surface perpendicularly or obliquely; or it is the force impressed on the surface, or tendency to motion which it acquires, and which must be opposed by an equal force in the opposite direction, in order that the surface may be maintained in its place. It is of importance to keep in mind, that this pressure is always perpendicular to the surface. It is a proposition founded on universal and uncontradicted experience, that the mutual actions of bodies on each other are always exerted in a direction perpendicular to the touching surfaces. Thus, it is observed, that when a billiard ball A is struck by another B, moving in any direction whatever, the ball A always moves off in the direction perpendicular to the plane which touches the two balls in the point of mutual contact, or point of impulse. This inductive proposition is supported by every argument which can be drawn from what we know concerning the forces which connect the particles of matter together, and are the immediate causes of the communication of motion. It would employ much time and room to state them here; and we apprehend that it is unnecessary: for no reason can be assigned why the pressure should be in any particular oblique direction. If any one should say that the impulse will be in the direction of the stream, we have only to desire him to take notice of the effect of the rudder of a ship. This shows that the impulse is *not* in the direction of the stream, and is therefore in some direction transverse to the stream. He will also find, that when a plane surface is impelled obliquely by a fluid, there is no direction in which it can be supported but the direction perpendicular to itself. It is quite safe, in the mean time, to take it as an experimental truth. We may, perhaps, in some other part of this work, give what will be received as a rigorous demonstration.

*Relative or effective impulse* means the pressure on the surface estimated at some particular direction. Thus BC (fig. 1.) may represent the sail of a ship, impelled by the wind blowing in the direction DC. GO may be the direction of the ship's keel, or the line of her course. The wind strikes the sail in the direction OH parallel to DC; the sail is urged or pressed in the direction GI, perpendicular to BC. But we are interested to know what tendency this will give the ship to move in the direction GO. This is the *effective* or *relative impulse*. Or BC may be the transverse section of the sail of a common wind-mill. This, by the construction of the machine, can move only in the direction CP, perpendicular to the direction of the wind; and it is only in this direction that the impulse produces the desired effect. Or BC may be half of the prow of a punt or lighter, riding at anchor by means of the cable DC, attached to the prow C. In this case, CQ, parallel to DC, is that part of the absolute impulse which is employed in straining the cable.

The *angle of incidence* is the angle FGC contained between the direction of the stream FG and the plane BC.

The *angle of obliquity* is the angle OGC contained between the plane and the direction GO, in which we wish to estimate the impulse.

PROP. II. The direct impulse of a fluid on a plane surface, is to its absolute oblique impulse on the same surface, as the square of the radius to the square of the sine of the angle of incidence. 17  
Second law  
of resistance.

Let a stream of fluid, moving in the direction DC, (fig. 1.) act on the plane BC. With the radius CB describe the quadrant ABE; draw CA perpendicular to CE, and draw MNBS parallel to CE. Let the particle F, moving in the direction FG, meet the plane in O, fall in FG produced take GH to represent the magnitude of the direct impulse, or the impulse which the particle would exert on the plane AC, by meeting it in V. Draw GI and HI perpendicular to BC, and HI perpendicular to GI. Also draw BR perpendicular to DC.

The force GH is equivalent to the two forces GI and GK; and GK being in the direction of the plane has no share in the impulse. The absolute impulse, therefore, is represented by GI; the angle GHI is equal to FGC, the angle of incidence; and therefore GH is to GI as radius to the sine of the angle of incidence: Therefore the direct impulse of each particle or filament is to its absolute oblique impulse as radius to the sine of the angle of incidence. But further, the number of filaments which strike the surface AC, is to the number of those which strike the surface BC as AC to BC. Now all the filaments between LA and ME will strike the oblique surface BC without striking AC. The AC is to the BC as rad. : sin. NBC, = rad. : sin. FGC = sin. incidence. Now the whole impulse is the impulse of each filament, and as the number of filaments exerting equal impulses jointly, therefore the whole direct impulse on AC is to the whole absolute impulse on BC, as the square of radius to the square of the sine of the angle of incidence.

Let S express the extent of the surface, i the angle of incidence, o the angle of obliquity, v the velocity of the fluid, and d its density. Let F represent the direct impulse, A the absolute oblique impulse, and p the relative or effective impulse: And let the tabular lines and columns be considered as decimal fractions of the radius unity.

This proposition gives us  $F : A :: \sin^2 i : 1$ , and therefore  $f = F \times \sin^2 i$ . Also, because impulses are in the proportion of the extent of surface similarly impelled, we have, in general,  $f = FS \times \sin^2 i$ .

The first who published this theorem was Pardies, in his *Oeuvres de Mathématique*, in 1673. We know that Newton had investigated the chief propositions of the Principia before 1670.

PROP. III. The direct impulse on any surface is to the effective oblique impulse on the same surface, as the cube of radius to the solid, which has for its base the square of the sine of incidence, and the sine of obliquity for its height. 18  
Third law.

For,

**Resistance.** For, when GH represents the direct impulse of a particle, GI is the absolute oblique impulse, and GO is the effective impulse in the direction GO: Now GI is to GO as radius to the sine of GIO, and GIO is the complement of IGO, and is therefore equal to CGO, the angle of obliquity.

$$\text{Therefore } f : \phi = R : \sin. O.$$

$$\text{But } F : f = R^2 : \sin.^2 i$$

$$\text{Therefore } F : \phi = R^2 : \sin.^2 i \times \sin. O, \text{ and}$$

$$\phi = F \times \sin. i \times \sin. O.$$

19  
Proportion  
of the di-  
rect im-  
pulse to the  
effective  
oblique im-  
pulse.

**Cor.** The direct impulse on any surface is to the effective oblique impulse in the direction of the stream, as the cube of radius to the cube of the sine of incidence. For draw IQ and GP perpendicular to GH, and IP perpendicular to GP; then the absolute impulse GI is equivalent to the impulse GQ in the direction of the stream, and GP, which may be called the transverse impulse. The angle GQI is evidently equal to the angle GHI, or FGO, the angle of incidence.

$$\text{Therefore } f : \phi = GI : GQ = R : \sin. i.$$

$$\text{But } F : f = R^2 : \sin.^2 i$$

$$\text{Therefore } F : \phi = R^2 : \sin.^2 i \times R : \sin. i.$$

$$\text{And } \phi = F \times \sin. i \times \sin. O.$$

20  
Impulse on  
a surface in  
motion.

Before we proceed further, we shall consider the impulse on a surface which is also in motion. This is evidently a frequent and an important case. It is perhaps the most frequent and important: It is the case of a sail under sail, and of a wind or water-mill at work.

Plate  
ccccxxv.

Therefore let a stream of fluid, moving with the direction and velocity DE, meet a plane BC, (fig. 1. Pl. 25), which is moving parallel to itself in the direction DE with the velocity DF: It is required to determine the impulse.

**Solving the case.** The mutual actions of bodies depend on their relative motions only. The motion DE of the fluid relative to BC, which is also in motion, is compounded of the real motion of the fluid and the opposite to the real motion of the body. Therefore produce FD till Df = DF, and complete the parallelogram DfE, and draw the diagonal De. The impulse on the plane is the same as if the plane were at rest, and every particle of the fluid impelled in the direction and with the velocity De; and may therefore be determined by the foregoing proposition. This proposition applies to every possible case; and we shall not bestow more time on it, but reserve the important modification of the general proposition for the cases which shall occur in the practical applications of the whole doctrine of the impulse and resistance of fluids.

**PROP. IV.** The direct impulse of a stream of fluid, whose breadth is given; to its oblique effective impulse in the direction of the stream, as the square of radius to the square of the sine of the angle of incidence.

For the number of filaments which occupy the oblique plane BC, would occupy the portion NC of a perpendicular plane, and therefore we have only to compare the perpendicular impulse on any point V with the effective impulse made by the same filament FV on the oblique plane at G. Now GH represents the impulse which this filament would make at V; and GQ is the effective impulse of the same filament at G, estimated in the direction GH of the stream; and GH is to GQ as GH<sup>2</sup> to GI<sup>2</sup>, that is, as rad.<sup>2</sup> to sin.<sup>2</sup> i.

VOL. XVI. Part I.

**Cor. 1.** The effective impulse in the direction of the stream on any plane surface BC, is to the direct impulse on its base BR or SE, as the square of the sine of the angle of incidence to the square of the radius.

2. If an isosceles wedge ACB (fig. 2.) be exposed to a stream of fluid moving in the direction of its height CD, the impulse on the sides is to the direct impulse on the base as the square of half the base AD to the square of the side AC, or as the square of the sine of half the angle of the wedge to the square of the radius. For it is evident, that in this case the two transverse impulses, such as GP in fig. 1, balance each other, and the only impulse which can be observed is the sum of the two impulses, such as GQ of fig. 1, which are to be compared with the impulses on the two halves AD, DB of the base. Now AC : AB = rad. : sin. ACD, and ACD is equal to the angle of incidence.

Therefore, if the angle ACB is a right angle, and ACD is half a right angle, the square of AC is twice the square of AD, and the impulse on the sides of a rectangular wedge is half the impulse on its base.

Also, if a cube ACBE (fig. 3.) be exposed to a stream moving in a direction perpendicular to one of its sides, and then to a stream moving in a direction perpendicular to one of its diagonal planes, the impulse in the first case will be to the impulse in the second as  $\sqrt{2}$  to 1. Call the perpendicular impulse on a side F, and the perpendicular impulse on its diagonal plane f, and the effective oblique impulse on its sides  $\phi$ ;—we have

$$F : f = AC : AB = 1 : \sqrt{2}, \text{ and}$$

$$f : \phi = AC^2 : AD^2 = 2 : 1. \text{ Therefore}$$

$$F : \phi = 2 : \sqrt{2}, = \sqrt{2} : 1, \text{ or}$$

very nearly as 10 to 7.

The same reasoning will apply to a pyramid whose base is a regular polygon, and whose axis is perpendicular to the base. If such a pyramid is exposed to a stream of fluid moving in the direction of the axis, the direct impulse on the base is to the effective impulse on the pyramid, as the square of the radius to the square of the sine of the angle which the axis makes with the sides of the pyramid.

And, in like manner, the direct impulsion on the base of a right cone is to the effective impulsion on the conical surface, as the square of the radius to the square of the sine of half the angle at the vertex of the cone. This is demonstrated, by supposing the cone to be a pyramid of an infinite number of sides.

We may in this manner compare the impulse on any polygonal surface with the impulse on its base, by comparing apart the impulses on each plane with those in their corresponding bases, and taking their sum.

And we may compare the impulse on a curved surface with that on its base, by resolving the curved surface into elementary planes, each of which is impelled by an elementary filament of the stream.

The following beautiful proposition, given by Le Scur and Jaquier, in their Commentary on the second Book of Newton's Principia, with a few examples of its application, will suffice for any further account of this theory.

**PROP. V.** Let ADB (fig. 4.) be the section of a surface of simple curvature, such as is the surface of a cylinder. Let this be exposed to the action of a fluid moving in the direction AC. Let BC be the section of the surface compared with that on its base.

22  
The im-  
pulse on a  
curved sur-  
face com-  
pared with  
that on its

Resistance.

section of the plane (which we have called its base), perpendicular to the direction of the stream. In AC produced, take any length CG; and on CG describe the semicircle CHG, and complete the rectangle BCGO. Through any point D of the curve draw ED parallel to AC, and meeting BC and OG in Q and P. Let DF touch the curve in D, and draw the chord GH parallel to DF, and HKM perpendicular to CG, meeting ED in M. Suppose this to be done for every point of the curve ADB, and let LMN be the curve which passes through all the points of intersection of the parallels EDP and the corresponding perpendiculars HKM.

The effective impulse on the curve surface ADB in the direction of the stream, is to its direct impulse on the base BC as the area BCNL is to the rectangle BCGO.

Draw  $edqmp$  parallel to EP and extremely near it. The arch Dd of the curve may be conceived as the section of an elementary plane, having the position of the tangent DF. The angle EDF is the angle of incidence of the filament ED  $d$ . This is equal to CGH, because ED, DF, are parallel to CG, GH; and (because CHG is a semicircle) CH is perpendicular to GH. Also  $CG : CH = CH : CK$ , and  $CG : CK = CG^2 : CH^2 = \text{rad.}^2 : \sin.^2$ ,  $CGH = \text{rad.}^2 : \sin.^2$  incid. Therefore if CG, or its equal DP, represent the direct impulse on the point Q of the base, CK, or its equal QM, will represent the effective impulse on the point D of the curve. And thus,  $QqpP$  will represent the direct impulse of the filament on the element  $Qq$  of the base, and  $QqmM$  will represent the effective impulse of the same filament on the element Dd of the curve. And, as this is true of the whole curve ADB, the effective impulse on the whole curve will be represented by the area BCNML; and the direct impulse on the base will be represented by the rectangle BCGO; and therefore the impulse on the curve surface is to the impulse on the base as the area BLMNC is to the rectangle BCGO.

It is plain, from the construction, that if the tangent to the curve at A is perpendicular to AC, the point N will coincide with G. Also, if the tangent to the curve at B is parallel to AC, the point L will coincide with B.

Whenever, therefore, the curve ADB is such that an equation can be had to exhibit the general relation between the abscissa AR and the ordinate DR, we shall deduce an equation which exhibits the relation between the abscissa CK and the ordinate KM of the curve LMN; and this will give us the ratio of BLMNC to BCGO.

Thus, if the surface is that of a cylinder, so that the curve BDA  $b$  (fig. 5.), which receives the impulse of the fluid, is a semicircle, make CG equal to AC, and construct the figure as before. The curve BMC is a parabola, whose axis is CG, whose vertex is G, and whose parameter is equal to CG. For it is plain, that  $CG = DC$ , and  $GH = CQ = MK$ . And  $CG \times GK = GH^2 = KM^2$ . That is, the curve is such, that the square of the ordinate KM is equal to the rectangle of the abscissa GK and a constant line GC; and it is therefore a parabola whose vertex is G. Now, it is well

known, that the parabolic area BMGC is two-thirds of the parallelogram BCGO. Therefore the impulse on the quadrant ADB is two-thirds of the impulse on the base BC. The same may be said of the quadrant Adb and its base cb. Therefore, *The impulse on a cylinder or half cylinder is two-thirds of the direct impulse on its transverse plane through the axis; or it is two-thirds of the direct impulse on one side of a parallelopiped of the same breadth and height.*

PROP. VI. If the body be a solid generated by the revolution of the figure BDAC (fig. 4.) round the axis AC; and if it be exposed to the action of a stream of fluid moving in the direction of the axis AC; then the effective impulse in the direction of the stream is to the direct impulse on its base, as the solid generated by the revolution of the figure BLMNC round the axis CN to the cylinder generated by the revolution of the rectangle BCGO.

This scarcely needs a demonstration. The figure ADBLMNA is a section of these solids by a plane passing through the axis; and what has been demonstrated of this section is true of every other, because they are all equal and similar. It is therefore true of the whole solids, and (their base) the circle generated by the revolution of BC round the axis AC.

Hence we easily deduce, that *The impulse on a sphere is one half of the direct impulse on its great circle, or on the base of a cylinder of equal diameter.*

For in this case the curve BMC (fig. 5.) which generates the solid expressing the impulse on the sphere is a parabola, and the solid is a parabolic conoid. Now this conoid is to the cylinder generated by the revolution of the rectangle BCGO round the axis AC as the sum of all the circles generated by the revolution of ordinates to the parabola such as KM, to the sum of as many circles generated by the ordinates to the rectangle such as KT; or as the sum of all the squares described on the ordinates KM to the sum of as many squares described on the ordinates KT. Draw BG cutting MK in S. The square on MK is to the square on BC or TK as the abscissa GK to the abscissa GC (by the nature of the parabola), or as SK to BC; because SK and BC are respectively equal to GK and GC. Therefore the sum of all the squares on ordinates, such as MK, is to the sum of as many squares on ordinates, such as TK, as the sum of all the lines SK to the sum of as many lines TK; that is, as the triangle BGC to the rectangle BCGO; that is, as one to two; and therefore the impulse on the sphere is one half of the direct impulse on its great circle.

From the same construction we may very easily deduce a very curious and seemingly useful truth, that of all conical bodies having the circle whose diameter is AB (fig. 2.) for its base, and FD for its height, the one which sustains the smallest impulse or meets with the smallest resistance is the frustum AGHB of a cone ACB so constructed, that EF being taken equal to ED, EA is equal to EC. This frustum, though more capacious than the cone AFB of the same height, will be less resisted.

Also, if the solid generated by the revolution of BDAC (fig. 4.) have its anterior part covered with a frustum of a cone generated by the lines Da, aA, forming

**Resistance.** forming the angle at  $a$  or 135 degrees; this solid, though more capacious than the included solid, will be less resisted.

And, from the same principles, Sir Isaac Newton determined the form of the curve ADB which would generate the solid which, of all others of the same length and base, should have the least resistance.

These are curious and important deductions, but are not introduced here, for reasons which will soon appear.

The reader cannot fail to observe, that all that we have hitherto delivered on this subject, relates to the comparison of different impulses or resistances. We have always compared the oblique impulses with the direct, and by their intervention we compare the oblique impulses with each other. But it remains to give absolute measures of some individual impulse; to which, as to an unit, we may refer every other. And as it is by their pressure that they become useful or hurtful, and they must be opposed by other pressures, it becomes extremely convenient to compare them all with that pressure with which we are most familiarly acquainted, the pressure of gravity.

26  
Different  
impulsions  
compared  
with the  
pressure of  
gravity.

The manner in which the comparison is made, is this: When a body advances in a fluid with a known velocity, it puts a known quantity of the fluid into motion (as it is supposed) with this velocity; and this is done in a known time. We have only to examine what weight will put this quantity of fluid into the same motion, by acting on it during the same time. This weight is conceived as equal to the resistance. Thus, let us suppose that a stream of water, moving at the rate of eight feet per second, is perpendicularly obstructed by a square foot of solid surface held fast in its place. The moving water to act in the manner of the hypotenuse of the solid now described, and to be without elasticity, the whole effect is the gradual annihilation of the motion of eight cubic feet of water moving eight feet in a second. And this is done in a second of time. It is equivalent to the gradually putting eight cubic feet of water into motion with this velocity; and doing this by acting uniformly during a second. What weight is able to produce this effect? The weight of eight feet of water, acting during a second on it, will, as is well known, give it the velocity of thirty-two feet per second; that is, four times greater. Therefore, the weight of the fourth part of eight cubic feet, that is, the weight of two cubic feet, acting during a second, will do the same thing, or the weight of a column of water whose base is a square foot, and whose height is two feet. This will not only produce this effect in the same time with the impulsion of the solid body, but it will also do it by the same degrees, as any one will clearly perceive, by attending to the gradual acceleration of the mass of water urged by  $\frac{1}{4}$  of its weight, and comparing this with the gradual production or extinction of motion in the fluid by the progress of the resisted surface.

Now it is well known that 8 cubic feet of water, by falling one foot, which it will do in one-fourth of a second, will acquire the velocity of eight feet per second by its weight; therefore the force which produces the same effect in a whole second is one-fourth of this. This force is therefore equal to the weight of a column of

water, whose base is a square foot, and whose height is two feet; that is, twice the height necessary for acquiring the velocity of the motion by gravity. The conclusion is the same, whatever be the surface that is resisted, whatever be the fluid that resists, and whatever be the velocity of the motion. In this inductive and familiar manner we learn, that the direct impulse or resistance of an unelastic fluid on any plane surface, is equal to the weight of a column of the fluid having the surface for its base, and twice the fall necessary for acquiring the velocity of the motion for its height: and if the fluid is considered as elastic, the impulse or resistance is twice as great. See Newt. *Princip.* B. II. Prop. 35. and 38.

27  
It now remains to compare this theory with experiment. Many have been made, both by Sir Isaac Newton and by subsequent writers. It is much to be lamented, that in a matter of such importance, both to the philosopher and to the artist, there is such a disagreement in the results with each other. We shall mention the experiments which seem to have been made with the greatest judgment and care. Those of Sir Isaac Newton were chiefly made by the oscillations of pendulums in water, and by the descent of balls both in water and in air. Many have been made by Mariotte (*Traité de Mouvement des Eaux*). Gravesande has published, in his *System of Natural Philosophy*, experiments made on the resistance or impulsions on solids in the midst of a pipe or canal. They are extremely well contrived, but are on so small a scale that they are of very little use. Daniel Bernouilli, and his pupil Professor Krafst, have published, in the *Comment. Acad. Petropol.* experiments on the impulse of a stream or vein of water from an orifice or tube: These are of great value. The Abbé Bossut has published others of the same kind in his *Hydrodynamique*. Mr Robins has published, in his *New Principles of Gunnery*, many valuable experiments on the impulse and resistance of air. The Chev. de Borda, in the *Mem. Acad. Paris*, 1763 and 1767, has given experiments on the resistance of air and also of water, which are very interesting. The most complete collection of experiments on the resistance of water are those made at the public expence by a committee of the academy of sciences, consisting of the marquis de Condorcet, M. d'Alembert, Abbé Bossut, and others. The Chev. de Buat, in his *Hydraulique*, has published some most curious and valuable experiments, where many important circumstances are taken notice of, which had never been attended to before, and which give a view of the subject totally different from what is usually taken of it. Don George d'Ulloa, in his *Examine Maritime*, has also given some important experiments, similar to those adduced by Bouguer in his *Manœuvre des Vaisseaux*, but leading to very different conclusions. All these should be consulted by such as would acquire a practical knowledge of this subject. We must content ourselves with giving their most general and steady results. Such as,

1. It is very consonant to experiment that the resistances are proportional to the squares of the velocities. When the velocities of water do not exceed a few feet per second, no sensible deviation is observed. In very small velocities the resistances are sensibly greater than in this proportion, and this excess is plainly owing to the viscosity or imperfect fluidity of matter. Sir Isaac

**Resistance.** Newton has shown that the resistance arising from this cause is constant, or the same in every velocity; and when he has taken off a certain part of the total resistance, he found the remainder was very exactly proportionable to the square of the velocity. His experiments to this purpose were made with balls a very little heavier than water, so as to descend very slowly; and they were made with his usual care and accuracy, and may be depended on.

28  
Causes of  
its disagree-  
ment with  
them.

In the experiments made with bodies floating on the surface of water, there is an addition to the resistance arising from the inertia of the water. The water heaps up a little on the anterior surface of the floating body, and is depressed behind it. Hence arises a hydrostatical pressure, acting in concert with the true resistance. A similar thing is observed in the resistance of air, which is condensed before the body and rarefied behind it, and thus an additional resistance is produced by the unbalanced elasticity of the air; and also because the air, which is *actually* displaced, is denser than common air. These circumstances cause the resistances to increase faster than the squares of the velocities; but, even independent of this, there is an additional resistance arising from the tendency to rarefaction behind a very swift body; because the pressure of the surrounding fluid can only make the fluid fill the space left with a determined velocity.

We have had occasion to speak of this circumstance more particularly under GUNNERY and PNEUMATICS, when considering very rapid motions. Mr Robins had remarked that the velocity at which the observed resistance of the air began to increase so prodigiously, was that of about 1100 or 1200 feet per second, and that this was the velocity with which air would rush into a void. He concluded, that when the velocity was greater than this, the ball was exposed to the additional resistance arising from the unbalanced statical pressure of the air, and that this constant quantity behaved to be added to the resistance arising from the air's inertia in all greater velocities. This is very reasonable: But he imagined that in smaller velocities there was no such unbalanced pressure. But this cannot be the case: for although in smaller velocities the air will still fill up the space behind the body, it will not fill it up with air of the same density. This would be to suppose the motion of the air into the deserted place to be instantaneous. There must therefore be a rarefaction behind the body, and a pressure backward; arising from unbalanced elasticity, independent of the condensation on the anterior part. The condensation and rarefaction are caused by the same thing, viz. the limited elasticity of the air. Were this infinitely great, the smallest condensation before the body would be instantly diffused over the whole air, and so would the rarefaction, so that no pressure of unbalanced elasticity would be observed; but the elasticity is such as to propagate the condensation with the velocity of sound only, i. e. the velocity of 1142 feet per second. Therefore this additional resistance does not commence precisely at this velocity, but is sensible in all smaller velocities, as is very justly observed by Euler. But we are not yet able to ascertain the law of its increase, although it is a problem which seems susceptible of a tolerably accurate solution.

Precisely similar to this is the resistance to the motion of floating bodies, arising from the accumulation or gorging up of the water on their anterior surface, and its depression behind them. Were the gravity of the water infinite, while its inertia remains the same, the wave raised up at the prow of a ship would be instantly diffused over the whole ocean, and it would therefore be infinitely small, as also the depression behind the poop. But this wave requires time for its diffusion; and while it is not diffused, it acts by hydrostatical pressure. We are equally unable to ascertain the law of variation of this part of the resistance, the mechanics of waves being but very imperfectly understood. The height of the wave in the experiments of the French academy could not be measured with sufficient precision (being only observed *en passant*) for ascertaining its relation to the velocity. The Chev. Buat attempted it in his experiments, but without success. This must evidently make a part of the resistance in all velocities: and it still remains an undecided question, "What relation it bears to the velocities?" When the solid body is wholly buried in the fluid, this accumulation does not take place, or at least not in the same way; It may, however, be observed. Every person may recollect, that in a very swift running stream, a large stone at the bottom will produce a small swell above it; unless it lies very deep, a stone will not be observed. The water, on arriving at the obstacle, glides past it in every direction, and is deflected on all hands; and therefore what passes over it is also deflected upwards, and causes the water over it to rise above its level. The nearer that the body is to the surface, the greater will be the perpendicular rise of the water; and the water will be less diffused; and it is uncertain whether the elevation will be greater or less. By the whole elevation we mean the area of a perpendicular section of the elevation by a plane perpendicular to the direction of the stream. We are rather disposed to think that this area will be greatest when the body is near the surface. D'Ulloa has attempted to consider this subject scientifically; and is of a very different opinion, which he confirms by the single experiment to be mentioned by and by. Mean times, it is evident, that if the water which glides past the body cannot fill it behind it with sufficient velocity for filling up the space behind, there must be a void there; and thus a hydrostatical pressure must be superadded to the resistance arising from the inertia of the water. All must have observed, that if the end of a stick held in the hand be drawn slowly through the water, the water will fill the place left by the stick, and there will be no curled wave; but if the motion be very rapid, a hollow trough or gutter is left behind, and is not filled up till at some distance from the stick, and the wave which forms its sides is very much broken and curled. The writer of this article has often looked into the water from the poop of a second rate man of war when she was sailing 11 miles per hour, which is a velocity of 16 feet per second nearly; and he not only observed that the back of the rudder was naked for about two feet below the load water-line, but also that the trough or wake made by the ship was filled up with water which was broken and foaming to a considerable depth, and to a considerable distance from the vessel: There must therefore have been

**Resistance**

**Resistance** a void. He never saw the wake perfectly transparent (and therefore completely filled with water) when the velocity exceeded 9 or 10 feet per second. While this broken water is observed, there can be no doubt that there is a void and an additional resistance. But even when the space left by the body, or the space behind a still body exposed to a stream, is completely filled, it may not be filled sufficiently fast, and there may be (and certainly is, as we shall see afterwards) a quantity of water behind the body, which is moving more slowly away than the rest, and therefore hangs in some shape by the body, and is dragged by it, increasing the resistance. The quantity of this must depend partly on the velocity of the body or stream, and partly on the rapidity with which the surrounding water comes in behind. This last must depend on the pressure of the surrounding water. It would appear, that when this adjoining pressure is very great, as must happen when the depth is great, the augmentation of resistance now spoken of would be less. Accordingly this appears in Newton's experiments, where the balls were less retarded as they were deeper under water.

These experiments are so simple in their nature, and were made with such care, and by a person so able to detect and appreciate every circumstance, that they deserve great credit, and the conclusions legitimately drawn from them deserve to be considered as physical laws. We think that the present deduction is unexceptionable: for in the motion of balls, which hardly descend, their retardation being hardly sensible, the effect of depth must have borne a very great proportion to the whole resistance, and must have greatly influenced their motions; yet they were observed to fall as if the resistance had no way depended on the depth.

The same thing appears in Borda's experiments, where a plate, which was deeply immersed in the water, was resisted less than one that moved with the same velocity near the surface; and this was very constant and regular in a course of experiments. D'Ulloa, however, states the contrary: He says that the resistance of a board, which was a foot broad, immersed one foot in a stream moving two feet per second, was 15½ lbs. and the resistance to the same board, when immersed 2 feet in a stream moving 2½ feet per second (in which case the surface was a foot), was 16½ pounds (a).

We are very sorry that we cannot give a proper account of this theory of resistance by Don George Juan D'Ulloa, an author of great mathematical reputation, and the inspector of the marine academy in Spain. We have not been able to procure either the original or the French translation, and judge of it only by an extract by Mr Prony in his *Architecture Hydraulique*, § 868, &c. The theory is enveloped (according to M. Prony's custom) in the most complicated expressions, so that the physical principles are kept almost out of sight. When accommodated to the simplest possible case, it is nearly as follows:

Let  $o$  be an elementary orifice or portion of the surface of the side of a vessel filled with a heavy fluid, and let  $h$  be its depth under the horizontal surface of the

fluid. Let  $\delta$  be the density of the fluid, and  $\phi$  the accelerative power of gravity = 32 feet velocity acquired in a second.

It is known, says he, that the water would flow out at this hole with the velocity  $u = \sqrt{2\phi h}$ , and  $u^2 = 2\phi h$  and  $h = \frac{u^2}{2\phi}$ . It is also known that the pressure  $p$  on

the orifice  $o$  is  $\phi \delta h$ , =  $\phi \delta \frac{u^2}{2\phi}$ , =  $\frac{1}{2} \delta o u^2$ .

Now let this little surface  $o$  be supposed to move with the velocity  $v$ . The fluid would meet it with the velocity  $u + v$ , or  $u - v$ , according as it moved in the opposite or in the same direction with the efflux. In the equation  $p = \frac{1}{2} \delta o u^2$ , substitute  $u \pm v$  for  $u$ , and we have the pressure on  $o = p = \frac{\delta o}{2} (u \pm v)^2$ , =  $\frac{\delta o}{2} (\sqrt{2\phi h} \pm v)^2$ .

This pressure is a weight, that is, a mass of matter  $m$  actuated by gravity  $\phi$ , or  $p = \phi m$ , and  $m = \delta o (\sqrt{h} \pm \frac{v}{\sqrt{2\phi}})^2$ .

This elementary surface being immersed in a stagnant fluid, and moved with the velocity  $v$ , will sustain on one side a pressure  $\delta o (\sqrt{h} + \frac{v}{\sqrt{2\phi}})^2$  and on the other side a pressure  $\delta o (\sqrt{h} - \frac{v}{\sqrt{2\phi}})^2$ ; and the sensible resistance will be the difference of these two pressures, which is  $\delta o 4 \sqrt{h} \frac{v}{\sqrt{2\phi}}$ , or  $\delta o 4 \sqrt{h} \frac{v}{8}$ , that is,  $\frac{\delta o \sqrt{h} v}{2}$ , because  $\sqrt{2\phi} = 8$ ; a quantity which is in the subduplicate ratio of the depth under the surface of the fluid, and the simple ratio of the velocity of the resisted surface jointly.

There is nothing in experimental philosophy more certain than that the resistances are very nearly in the duplicate ratio of the velocities; and we cannot conceive by what experiments the ingenious author has supported this conclusion.

But there is, besides, what appears to us to be an essential defect in this investigation. The equation exhibits no resistance in the case of a fluid without weight. Now a theory of the resistance of fluids should exhibit the retardation arising from inertia alone, and should distinguish it from that arising from any other cause: and moreover, while it assigns an ultimate sensible resistance proportional (*ceteris paribus*) to the simple velocity, it assumes as a first principle that the pressure  $p$  is as  $u^2$ . It also gives a false measure of the statical pressures: for these (in the case of bodies immersed in our waters at least) are made up of the pressure of the incumbent water, which is measured by  $h$ , and the pressure of the atmosphere, a constant quantity.

Whatever reason can be given for setting out with the principle that the pressure on the little surface  $o$ , moving with the velocity  $u$ , is equal to  $\frac{1}{2} \delta o (u \pm v)^2$ , makes it indispensably necessary to take for the velocity

$u$ ,

(A) There is something very unaccountable in these experiments. The resistances are much greater than any other author has observed.

**Resistance.**  $u$ , not that with which water would issue from a hole whose depth under the surface is  $h$ , but the velocity with which it will issue from a hole whose depth is  $h + 33$  feet. Because the pressure of the atmosphere is equal to that of a column of water 33 feet high: for this is the acknowledged velocity with which it would rush in to the void left by the body. If therefore this velocity (which does not exist) has any share in the effort, we must have for the fluxion of

pressure not  $\frac{4\sqrt{bv}}{\sqrt{2\phi}}$  but  $\frac{4\sqrt{h+b+33}v}{\sqrt{2\phi}}$ . This would not

only give pressure or resistances many times exceeding those that have been observed in our experiments, but would also totally change the proportions which this theory determines. It was at any rate improper to embarrass an investigation, already very intricate, with the pressure of gravity, and with two motions of efflux, which do not exist, and are necessary for making the pressures in the ratio of  $u+v$  and  $u-v$ .

Mr Prony has been at no pains to inform his readers of his reasons for adopting this theory of resistance, so contrary to all received opinions, and to the most distinct experiments. Those of the French academy, made under greater pressures, gave a much smaller resistance; and the very experiments adduced in support of his theory are extremely deficient, wanting fully  $\frac{1}{3}$  of what the theory requires. The resistances by experiment were  $15\frac{1}{2}$  and  $26\frac{1}{2}$ , and the theory required  $20\frac{1}{2}$  and  $39$ . The equation, however, deduced from the theory is greatly deficient in the expression of the pressures caused by the accumulation and depression, stating the

heights of them as  $= \frac{v^2}{2\phi}$ . They can never be so high,

because the heaped up water flows off at the sides, and it also comes in behind by the sides; so that the pressure is much less than half the weight of a column whose height is  $\frac{v^2}{2\phi}$ ; both because the accumulation and de-

pression are less at the sides than in the middle, and because, when the body is wholly immersed, the accumulation is greatly diminished. Indeed in this case the final equation does not include their effects, though as real in this case as when part of the body is above water.

Upon the whole, we are somewhat surprised that an author of D'Ulloa's eminence should have adopted a theory so unnecessarily and so improperly embarrassed with foreign circumstances; and that Mr Prony should have inserted it with the explanation by which he was to abide, in a work destined for practical use.

This point, or the effect of deep immersion, is still much contested; and it is a received opinion, by many not accustomed to mathematical researches, that the resistance is greater in greater depths. This is assumed as an important principle by Mr Gordon, author of *A Theory of Naval Architecture*; but on very vague and slight grounds; and the author seems unacquainted with the manner of reasoning on such subjects. It shall be considered afterwards.

With these corrections, it may be asserted that theory and experiment agree very well in this respect, and that the resistance may be asserted to be in the duplicate ratio of the velocity.

We have been more minute on this subject, because it is the leading proposition in the theory of the ac-

tion of fluids. Newton's demonstration of it takes no notice of the manner in which the various particles of the fluid are put into motion, or the motion which each in particular acquires. He only shows, that if there be nothing concerned in the communication but pure inertia, the sum total of the motions of the particles, estimated in the direction of the bodies motion, or that of the stream, will be in the duplicate ratio of the velocity. It was therefore of importance to show that this part of the theory was just. To do this, we had to consider the effect of every circumstance which could be combined with the inertia of the fluid. All these had been foreseen by that great man, and are most briefly, though perfectly, mentioned in the last scholium to Prop. 36. B. II.

It appears from a comparison of all the experiments, that the impulses and resistances are very nearly in the proportion of the surfaces. They appear, however, to increase somewhat faster than the surfaces. The Chevalier Borda found that the resistance, with the same velocity, to a surface of

9 inches	} was {	9	} {	
16		17.535		16
36		42.759		36
81		104.737		81

The deviation in these experiments from the theory increases with the surface, and is probably much greater in the extensive surfaces of the sails of ships and windmills, and the hulls of ships.

3. The resistances do by no means vary in the duplicate ratio of the lines of the angles of incidence.

As this is the most interesting circumstance, having a chief influence on all the particular modifications of the resistance of fluids, and as on this depends the whole theory of the construction and working of ships, and the action of water on our most important machines, and seems most immediately connected with the mechanism of fluids, it merits a very particular consideration. We cannot do a greater service than by rendering more generally known the excellent experiments of the French academy.

Fifteen boxes, or vessels were constructed, which were two feet wide, and two feet deep, and four feet long. One of them was a parallelepiped of these dimensions; the others had prows of a wedge-form, the angle ACB (fig. 7.) varying by  $10^\circ$  degrees from  $12^\circ$  to  $180^\circ$ ; so that the angle of incidence increased by  $6^\circ$  from one to another. These boxes were dragged across a very large basin of smooth water (in which they were immersed two feet) by means of a line passing over a wheel connected with a cylinder, from which the actuating weight was suspended. The motion became perfectly uniform after a very little way; and the time of passing over 96 French feet with this uniform motion was very carefully noted. The resistance was measured by the weight employed, after deducting a certain quantity (properly estimated) for friction, and for the accumulation of the water against the anterior surface. The results of the many experiments are given in the following table; where column 1st contains the angle of the prow, column 2d contains the resistance as given by the preceding theory, column 3d contains the resistance exhibited in the experiments, and column 4th contains the deviation of the experiment from the theory.

Resistance.

The resistance to 1 square foot, French measure, moving with the velocity of 2.56 feet per second, was very nearly 7.625 pounds French.

Reducing these to English measures, we have the surface = 1.153 feet, the velocity of the motion equal to 2.7283 feet per second, and the resistance equal to 8.114 pounds avoirdupois. The weight of a column of fresh water of this base, and having for its height the fall necessary for communicating this velocity, is 8.256 pounds avoirdupois. The resistances to other velocities were accurately proportional to the squares of the velocities.

There is great diversity in the value which different authors have deduced for the absolute resistance of water from their experiments. In the value now given nothing is taken into account but the inertia of the water. The accumulation against the fore part of the box was not noted, and the statical pressure backwards, arising from the wake, was subtracted from the whole resistance to the drag. There had not been a sufficient variety of experiments for discovering the share which tenacity and friction produced; so that the number of pounds set down here may be considered as somewhat superior to the mere effects of the inertia of the water. We think, upon the whole, that it is the most accurate determination yet given of the resistance to a body in motion: but we shall afterwards see reasons for believing, that the impulse of a running stream, having the same velocity is somewhat greater; and this is the form in which most of the experiments have been made.

Also observe, that the resistance here given is that to a vessel two feet broad and deep and four feet long. The resistance to a plane of two feet broad and deep would probably have exceeded this in the proportion of 15.22 to 14.54, for reasons we shall see afterwards.

34  
and others.

From the experiments of Chevalier Borda, it appears, that a body of one foot square, French measure, and two feet long, having its centre 15 inches under water, moving three French feet per second, sustained a pressure of 14.54 French pounds, or 15.63 English. This reduced in the proportion of 3<sup>2</sup> to 2.56<sup>2</sup> gives 11.43 pounds, considerably exceeding the 8.24.

M. Bouguer, in his *Manœuvre des Vaisseaux*, says, that he found the resistance of sea water to a velocity of one foot to be 23 ounces *poids des Marc*.

The Chevalier Borda found the resistance of sea water to the face of a cubic foot, moving against the water one foot per second, to be 21 ounces nearly. But

this experiment is complicated: the wave was not deduced; and it was not a plane, but a cube.

Don George d'Ulloa found the impulse of a stream of sea water, running two feet per second on a foot square, to be 15½ pounds English measure. This greatly exceeds all the values given by others.

From these experiments we learn, in the first place, <sup>35</sup> That the direct resistance to a motion of a plane surface <sup>comes from</sup> through water, is very nearly equal to the weight of a <sup>them.</sup> column of water having that surface for its base, and for its height the fall producing the velocity of the motion. This is but one half of the resistance determined by the preceding theory. It agrees, however, very well with the best experiments made by other philosophers on bodies totally immersed or surrounded by the fluid; and sufficiently shows, that there must be some fallacy in the principles or reasoning by which this result of the theory is supposed to be deduced. We shall have occasion to return to this again.

But we see that the effects of the obliquity of incidence deviate enormously from the theory, and that this deviation increases rapidly as the acuteness of the prow increases. In the prow of 60° the deviation is nearly equal to the whole resistance pointed out by the theory, and in the prow of 12° it is nearly 40 times greater than the theoretical resistance.

The resistance of the prow of 90° should be one-half the resistance of the base. We have not such a prow; but the medium between the resistance of the prow of 66 and 84 is 5790, instead of 500.

These experiments are very conform to those of other authors on plane surfaces. Mr Robins found the resistance of the air to a pyramid of 45°, with its apex foremost, was to that of its base as 1000 to 1411, instead of one to two. Chevalier Borda found the resistance of a cube, moving in water in the direction of the side, was to the oblique resistance, when it was moved in the direction of the diagonal, in the proportion of 5½ to 7; whereas it should have been that of √2 to 1, or of 10 to 7 nearly. He also found, that a wedge whose angle was 90°, moving in air, gave for the proportion of the resistances of the edge and base 7281 : 10000, instead of 5000 : 10000. Also when the angle of the wedge was 60°, the resistances of the edge and base were 52 and 100, instead of 25 and 100.

In short, in all the cases of oblique plane surfaces, the resistances were greater than those which are assigned by the theory. The theoretical law agrees tolerably with observation in large angles of incidence, that is, in incidences not differing very far from the perpendicular; but in more acute prows the resistances are more nearly proportional to the sines of incidence than to their squares.

The academicians deduced from these experiments an expression of the general value of the resistance, which corresponds tolerably well with observation. Thus let  $\alpha$  be the complement of the half angle of the prow, and let  $P$  be the direct pressure or resistance, with an incidence of 90°, and  $p$  the effective oblique pressure:

then  $p = P \times \cos^2 \alpha + 3.153 \left( \frac{\alpha}{60} \right)^{3.25}$ . This gives for a prow of 12° an error in defect about  $\frac{1}{100}$ , and in larger angles it is much nearer the truth; and this is exact enough for any practice.

This.

**Resistance.** properties of the direct and oblique resistances of plane surfaces, he considers the resistances to arise from mutual collisions of the surface and fluid, repeated at intervals of time too small to be perceived. But in making this comparison, he has no occasion whatever to consider this repetition; and when he assigns the proportion between the resistance of a cone and of its base, he, in fact, assigns the proportion between two simultaneous and instantaneous impulses. But the mathematicians who followed him have considered this repetition as equivalent to an augmentation of the initial or first impulse; and in this way have attempted to demonstrate that the resistances are as the squares of the velocities. When the velocity is double, each impulse is double, and the number in a given time is double; therefore, say they, the resistance, and the force which will withstand it, is quadruple; and observation confirms their deduction: yet nothing is more uncertain and illogi-

cal. It is very true that the resistance, conceived as Newton conceives it, the resistance furnished by a body moving in the fluid, is not impulsive; but the instantaneous impulse, and the force which can withstand it, is, by all persons of moderate understanding. What is the difference between an impulse and a static impulse? Nothing but impulse can be opposed to impulse; and it is a gross misconception to think of having any kind of comparison between impulse and pressure. It is this which has given rise to great disputes and difficulties, relating about the force of pressure, which is stated to be infinitely greater than motion, and is equivalent to a pressure infinitely increased. It is thus the epitome of these doctrines at this time, the resistance of all pressures whatever, and the resistance to motion, and tendency to motion, was the subject of dispute. The celebrated Euler, perhaps the ablest mathematician and the best philosopher, of the present age, says, "these motion and impulse are seen so well, and therefore for that by means of motion pressure may be produced, as when a body in motion strikes against a wall, or when a body moving in a curved channel presses against it, thereby it conveys of its curvilinear motion, and the exertion of a centrifugal force; and since Nature is wonderfully economical in all her operations; it is natural to suppose that pressure, or tendency to motion, has any other origin; and it is the business of a philosopher to discover by what causes any observed pressure is produced." "When any pressure is observed, such as the pressure of gravity, of magnetism, of electricity, of condensed vapour, of a spring, and of elasticity and cohesion themselves, however disparate, nay, opposite, the philosopher must immediately call about, and contrive a set of motions (namely, *per se* said the movers) which will produce a pressure like the one observed. Having pleased his fancy in this, he cries out *ingenue*, "this will produce the pressure;" *et frustra fit per plura quod fieri potest per pauciora*, "therefore in this way the pressure is produced." Thus the vortices of Descartes are brought back in triumph, and have produced vortices without number, which fill the universe with motion and pressure.

Such bold attempts to overturn long received doctrines in mechanics, could not be received without much criticism and opposition; and many able dissertations appeared from time to time in defence of the common doctrines. In consequence of the many objections to

VOL. XVI. Part 1.

the comparison of pure pressure with pure percussion or impulse, John Bernouilli and others were at last obliged to assert that there were no perfectly hard bodies in nature, nor could be, but that all bodies were elastic; and that in the communication of motion by percussion, the velocities of both bodies were *gradually* changed by their mutual elasticity acting during the finite but imperceptible time of the collision. This was, in fact, giving up the whole argument, and banishing percussion, while their aim was to get rid of pressure. For what is elasticity but a pressure? and how shall it be produced? To act in this instance, must it arise from a still smaller impulse? But this will require another elasticity, and so on without end.

These are all legitimate consequences of this attempt to date a comparison between percussion and pressure. Numberless experiments have been made to confirm the statement; and there is hardly an itinerant lecturing showman who does not exhibit among his apparatus Gravelande's machine (Vol. I. plate xxxv. fig. 4.) But nothing affords so specious an argument as the experimented proportionality of the impulse of fluids to the square of the velocity. Here is every appearance of the accumulation of an infinity of minute impulses, in the known ratio of the velocity, each to each, producing pressures which are in the ratio of the squares of the velocities.

The pressuress are observed ; but the impulses or percussions, whose accumulation produces these pressuress, are only supposed. The rare fluid, introduced by Newton for the purpose already mentioned, either does not exist in nature, or does not act in the manner we have said, the particles making their impulse, and then escaping through among the rest without affecting their motion. We cannot indeed say what may be the proportion between the diameter and the distance of the particles. The first may be incomparably smaller than the second, even in mercury, the densest fluid which we are familiarly acquainted with ; but although they do not touch each other, they act nearly as if they did, in consequence of their mutual attractions and repulsions. We have seen air a thousand times rarer in some experiments than in others, and therefore the distance of the particles at least ten times greater than their diameters ; and yet, in this rare state, it propagates all pressuress or impulses made on any part of it to a great distance, almost in an instant. It cannot be, therefore, that fluids act on bodies by impulse. It is very possible to conceive a fluid advancing with a flat surface against the flat surface of a solid. The very first and superficial particles may make an impulse ; and if they were annihilated, the next might do the same : and if the velocity were double, these impulses would be double, and would be resisted by a double force, and not a quadruple, as is observed : and this very circumstance, that a quadruple force is necessary, should have made us conclude that it was not to impulse that this force was opposed.

The first particles having made their stroke, and not being annihilated, must escape laterally. In their escaping, they effectually prevent every farther impulse, because they come in the way of those filaments which would have struck the body. The whole process seems to be somewhat as follows:

When the flat surface of the fluid has come into contact with the plane surface AD (fig. 6.), perpendicular

**Resistance.** to the direction DC of their motion, they must deflect to both sides equally, and in equal motions, because no reason can be assigned why more should go to either side. By this means the filament EF, which would have struck the surface in G, is deflected *before it arrives* at the surface, and describes a curved path EFIHK, continuing its rectilinear motion to I, where it is intercepted by a filament immediately adjoining to EF, on the side of the middle filament DC. The different particles of DC may be supposed to impinge in succession at C, and to be deflected at right angles, and gliding along CB, to escape at B. Each filament in succession, outwards from DC, is deflected in its turn, and being hindered from even touching the surface CB, it glides off in a direction parallel to it; and thus EF is deflected in I, moves parallel to CB from I to H, and is again deflected at right angles, and describes HK parallel to DC. The same thing may be supposed to happen on the other side of DC.

And thus it would appear, that except two filaments immediately adjoining to the line DC, which bisects the surface at right angles, no part of the fluid makes any impulse on the surface AB. All the other filaments are merely pressed against it by the lateral filaments without them, which they turn aside, and prevent from striking the surface.

Plate  
ccccxxxvi.  
40  
No impulse  
on the edge  
of a prism.

In like manner, when the fluid strikes the edge of a prism or wedge ACB (fig. 7.), it cannot be said that any real impulse is made. Nothing hinders us from supposing C a mathematical angle or indivisible point, not susceptible of any impulse, and serving merely to divide the stream. Each filament EF is effectually prevented from impinging at G in the line of its direction, and with the obliquity of incidence EGC, by the filaments between EF and DC, which glide along the surface CA; and it may be supposed to be deflected when it comes to the line CF which bisects the angle DCA, and again deflected and rendered parallel to DC at I. The same thing happens on the other side of DC; and we cannot in this case assert that there is any impulse.

41  
The ordinary theory of no use in naval architecture.

We now see plainly how the ordinary theory must be totally unfit for furnishing principles of naval architecture, even although a formula could be deduced from such a series of experiments as those of the French Academy. Although we should know precisely the impulse, or, to speak now more cautiously, the action, of the fluid on a surface GL (fig. 8.) of any obliquity, when it is alone, detached from all others, we cannot in the smallest degree tell what will be the action of part of a stream of fluid advancing towards it, with the same obliquity, when it is preceded by an adjoining surface CG, having a different inclination; for the fluid will not glide along GL in the same manner as if it were made part of a more extensive surface having the same inclination. The previous deflections are extremely different in these two cases; and the previous deflections are the only changes which we can observe in the motions of the fluid, and the only causes of that pressure which we observe the body to sustain, and which we call the impulse on it. This theory must, therefore, be quite unfit for ascertaining the action on a curved surface, which may be considered as made up of an indefinite number of successive planes.

We now see with equal evidence how it happens that

the action of fluids on solid bodies may and must be opposed by pressures, and may be compared with and measured by the pressure of gravity. We are not comparing forces of different kinds, percussions with pressures, but pressures with each other. Let us see whether this view of the subject will afford us any method of comparison or absolute measurement.

42  
Pressure, the action of fluids,

When a filament of fluid, that is, a row of corpuscles, are turned out of their course EF (fig. 6.), and forced to take another course IH, force is required to produce this change of direction. The filament is prevented from proceeding by other filaments which lie between it and the body, and which deflect it in the same manner as if it were contained in a bended tube, and it will press on the concave filament next to it as it would press on the concave side of the tube. Suppose such a bended tube ABC (fig. 9.), and that a ball A is projected along it with any velocity, and moves in it without friction: it is demonstrated, in elementary mechanics, that the ball will move with undiminished velocity, and will press on every point, such as B, of the concave side of the tube, in a direction perpendicular to the plane CBD, which touches the tube in the point B. The pressure on the adjoining filament is the pressure of its path, must be such and so great, that it deflects it; and it must be propagated to the next filament to the next, and thus argument the pressure on that next filament, already increased by the deflection of the intermediate filament, and thus the pressure towards the middle filament, and so on, till the sum of their accumulated sum must be equal to the pressure exerted on the middle filament, and on that account, cause a perfect fluid transmits every motion undiminished.

The pressure BF is equivalent to the pressure of one of which is perpendicular, and the other is parallel to the direction of the original motion. Suppose first (taken in any point of the curved surface of the filament), the two halves of the stream are brought together; and in the case of fig. 6. and 7. the two halves are brought together. But the pressure, such as BF, must be ultimately withstood by the surface ABC, and it is by these accumulated pressures that a solid body is urged down the stream; and it is these accumulated pressures which we observe, and measure in our experiments. We shall suppose a filament, and this is most easily demonstrated, that when a ball A (fig. 9.) moves with undiminished velocity in a tube is incurved that its axis at B is perpendicular to the plane CBD, the accumulated action of the pressures, such as BG, taken for every point of the path, is precisely equal to the force which would extinguish or extinguish the original motion.

In the same case, it follows most obviously, that if the motions of the filaments are such as we have described and represented by fig. 6. the whole pressure in the direction of the stream, that is, the whole pressure which can be observed on the surface, is equal to the weight of a column of fluid having the surface for its base, and twice they be the fall productive of the velocity for its height, precisely as Newton deduced it from other considerations; and it seems to make no odds whether the fluid be elastic or unelastic, if the deflections and velocities are the same. Now it is a fact, that no difference in this respect

43  
whether elastic or not.

Resistance: spect can be observed in the actions of air and water; and this had always appeared a great defect in Newton's theory; but it was only a defect of the theory attributed to him. But it is also true, that the observed action is but one-half of what is just now deduced from this improved view of the subject. Whence arises this difference? The reason is this: We have given a very erroneous account of the motions of the filaments. A filament EF does not move as represented in fig. 6. with two rectangular inflections at I and at H, and a path IH between them parallel to CB. The process of nature is more like what is represented in fig. 10. It is observed, that at the anterior part of the body A B, there remains a quantity of fluid ADB, almost, if not altogether, stagnant, of a singular shape, having two curved concave sides A a D, B b D, along which the middle filaments glide. This fluid is very slowly changed. The late Sir Charles Knowles, an officer of the British navy, equally eminent for his scientific professional knowledge and for his military talents, made many beautiful experiments for ascertaining the paths of the filaments of water. At a distance up the stream, he allowed small jets of a coloured fluid, which did not mix with water, to issue from the stream; and the experiments were made in troughs with sides and bottom of white glass. A small taper was placed at a considerable distance above, by which the shadow of the coloured filaments were most distinctly projected on a white paper laid below the trough, so that they were accurately drawn with a pencil. A few important particular may be here mentioned.

44  
Important  
experiments by  
Sir Charles  
Knowles;

The fluid water ADC lasted for a long while before it was renewed; and it seemed to be gradually renewed by the addition of the surrounding water, which gradually licked away the outer parts of the fluid ADC, and it seemed to renew itself in the same manner as to the motion of the stream. There was, however, a considerable intricacy and eddy in the motion. Some (seemingly superficial) water was continually, but slowly, flowing outward from the body AD, while other water was seen within and below flowing towards and going backwards.

The colour of lateral filaments were most constant in their form, while that of the body was the same, although the velocity was in some cases diminished. Any change which this produced seemed confined to the superficial filaments.

As the filaments were deflected, they were also compressed, that is, the curved parts of the filaments were nearer each other than the parallel straight filaments up the stream; and this compression was more considerable as the prow was more obtuse and the deflection greater.

The inner filaments were ultimately more deflected than those without them; that is, if a line EF touching the curve EFH in the point H of greatest flexure, where the concavity begins to be on the side next the body, the angle HKC, contained between the axis and this tangent line, is so much the greater as the filament is near the axis.

When the body exposed to the stream was a box of upright sides, flat bottom, and angular prow, like a wedge, having its edge also upright, the filaments were not all deflected laterally, as theory would make us expect; but the filaments near the bottom were also deflected downwards as well as laterally; and glided along

at some distance under the bottom, forming lines of double curvature.

The breadth of the stream that was deflected was much greater than that of the body; and the sensible deflection begun at a considerable distance up the stream, especially in the outer filaments.

Lastly, The form of the curves was greatly influenced by the proportion between the width of the trough and that of the body. The curvature was always less when the trough was very wide in proportion to the body.

Great varieties were also observed in the motion or velocity of the filaments. In general, the filaments increased in velocity outwards from the body to a certain small distance, which was nearly the same in all cases, and then diminished all the way outward. This was observed by inequalities in the colour of the filaments, by which one could be observed to outstrip another. The retardation of those next the body seemed to proceed from friction; and it was imagined that without this the velocity there would always have been greatest.

These observations give us considerable information with inferring from them.

respecting the mechanism of these motions, and the action of fluids upon solids. The pressure in the duplicate ratio of the velocities comes here again into view. We found, that although the velocities were very different, the curves were precisely the same. Now the observed pressures arise from the transverse forces by which each particle of a filament is retained in its curvilinear path; and we know that the force by which a body is retained in any curve is directly as the square of the velocity, and inversely as the radius of curvature. The curvature, therefore, remaining the same, the transverse forces, and consequently the pressure on the body, must be as the square of the velocity; and, on the other hand, we can see pretty clearly (indeed it is rigorously demonstrated by D'Alembert), that whatever be the velocities, the curves will be the same. For it is known in hydraulics, that it requires a fourfold or ninefold pressure to produce a double or triple velocity. And as all pressures are propagated through a perfect fluid without diminution, this fourfold pressure, while it produces a double velocity, produces also fourfold transverse pressures, which will retain the particles, moving twice as fast, in the same curvilinear paths. And thus we see that the impulses, as they are called, and resistances of fluids, have a certain relation to the weight of a column of fluid, whose height is the height necessary for producing the velocity. How it happens that a plane surface, immersed in an extended fluid, sustains just half the pressure which it would have sustained had the motions been such as are sketched in figure 6th, is a matter of more curious and difficult investigation. But we see evidently that the pressure must be less than what is there assigned; for the stagnant water a-head of the body greatly diminishes the ultimate deflections of the filaments: And it may be demonstrated, that when the part BE of the canal, fig. 9. is inclined to the part AB in an angle less than  $90^\circ$ , the pressures BG along the whole canal are as the versed sine of the ultimate angle of deflection, or the versed sine of the angle which the part BE makes with the part AB. Therefore, since the deflexions resemble more the sketch given in fig. 10. the accumulated sum of all these forces BG of fig. 9. must be less than the similar sum corresponding to fig. 6. that is, less than

**Resistance** the weight of the column of fluid, having twice the productive height for its height. How it is just one-half, shall be our next inquiry.

And here we must return to the labours of Sir Isaac Newton. After many beautiful observations on the nature and mechanism of continued fluids, he says, that the resistance which they occasion is but one-half of that occasioned by the rare fluid which had been the subject of his former proposition; which conclusion, says he, with his usual caution and modesty, "I have endeavoured to show."

46  
Investigations of  
Newton

He then enters into another as novel and as difficult investigation, viz. the laws of hydraulics, and endeavours to ascertain the motion of fluids through vessels when urged by pressures of any kind. He endeavours to ascertain the velocity with which a fluid escapes through a horizontal orifice in the bottom of a vessel, by the action of its weight, and the pressure which this vein of fluid will exert on a little circle which occupies part of the orifice. To obtain this, he employs a kind of approximation and trial, of which it would be extremely difficult to give an extract; and then, by increasing the diameter of the vessel and of the hole to infinity, he accommodates his reasoning to the case of a plane surface exposed to an indefinitely extended stream of fluid; and lastly, giving to the little circular surface the motion which he had before ascribed to the fluid, he says, that the resistance to a plane surface moving through an unelastic continuous fluid, is equal to the weight of a column of the fluid whose height is one-half of that necessary for acquiring the velocity; and he says, that the resistance of a globe is, in this case, the same with that of a cylinder of the same diameter. The resistance, therefore, of the cylinder or circle is four times less, and that of the globe is twice less than their resistances on a rare elastic medium.

47  
Liable to  
great ob-  
jections,

But this determination, though founded on principles or assumptions, which are much nearer to the real state of things, is liable to great objections. It depends on his method for ascertaining the velocity of the issuing fluid; a method extremely ingenious, but defective. The cataraet, which he supposes, cannot exist as he supposes, defending by the full action of gravity, and surrounded by a funnel of stagnant fluid. For, in such circumstances, there is nothing to balance the hydrostatical pressure of this surrounding fluid; because the whole pressure of the central cataraet is employed in producing its own descent. In the next place, the pressure which he determines is beyond all doubt only half of what is observed on a plane surface in all our experiments. And, in the third place, it is repugnant to all our experience, that the resistance of a globe or of a pointed body is as great as that of a circular base. His reasons are by no means convincing. He supposes them placed in a tube or canal, and that they are supposed of the same diameter, and that they leave equal spaces at their sides, he concludes, that because the water escapes by their sides with the same velocity, they will have the same resistance. But this is by no means a necessary consequence. Even if the water should be allowed to exert equal pressures on them, the pressures being perpendicular to their surfaces, and these surfaces being inclined to the axis, while in the case of the base of a cylinder it is in the direction of the axis, there must be a difference in

the accumulated or compound pressure in the direction of the axis. He indeed says, that in the case of the cylinder or the circle obstructing the canal, a quantity of water remains stagnant on its upper surface; viz. all the water whose motion would not contribute to the most ready passage of the fluid between the cylinder and the sides of the canal or tube; and that this water may be considered as frozen. If this be the case, it is indifferent what is the form of the body that is covered with this mass of frozen or stagnant water. It may be a hemisphere or a cone; the resistance will be the same. But Newton by no means assigns, either with precision or with distinct evidence, the form and magnitude of this stagnant water, so as to give confidence to the results. He contents himself with saying, that water whose motion is not necessary or cannot contribute to the most easy passage of the water.

There remains, therefore, many imperfections in this theory. But notwithstanding these defects, we cannot but admire the efforts and sagacity of this great philosopher, who, after having discovered so many sublime truths of mechanics, and traced so many new paths for the solution of problems, which no person had yet attempted to bring within the scope of mathematical investigation, still his reasoning, though accurate, shines throughout with that immense power and that fertility of resources, which he had never possessed in so eminent a degree.

Those who have attended the labours of Sir Isaac Newton have not been able to avoid the conviction, that amidst of principles, he has given us a great number, and the chief merit which any of them can claim, is that of having deduced from a few general principles, what happens to quadrature with some singular and important result, while their general theories are not only applicable, from difficulty and obscurity, to particular cases, with more general observation.

We must, however, except from this number Daniel Bernoulli, who was not only a philosopher, but one of the first philosophers of the age. He possessed all the talents, and was free from the faults of that celebrated family; and while he was the mathematician of Europe who penetrated furthest into the investigation of this great problem, he was the only person who felt, or at least who acknowledged, its great difficulty.

In the second volume of the *Comment. Petropol.* 1727, Bernoulli's hypothesis is brought forward for the resistance of fluids, deduced from principles quite different from those on which Newton founded his resolution. But he delivers it with great diffidence; because he found that it gave a resistance four times greater than experiment. In the third edition he determines the resistance of a sphere to be one-half of that of its great circle. But in his subsequent theory of Hydrodynamics (a work which must ever rank among the first productions of the age, and is equally eminent for refined and elegant mathematics, and ingenious and original thoughts in dynamics), he calls this determination in question. It is indeed founded on the same hypothetical principles which have been unskillfully detached from the rest of Newton's physics, and made the ground-work of all the subsequent theories on this subject.

In 1741 Mr Daniel Bernoulli published another dissertation

48  
though  
displaying  
great sagacity.

orifice, suppose horizontal lines  $E, F, \text{ \&c.}$  which will mark a similar surface on the opposite side of the vessel. Suppose the orifice  $EF$  to be shut. There can be no doubt but that the surfaces  $EF$  and  $e, f$  will be equally pressed in opposite directions. Now open the orifice  $EF$ , the water will rush out, and the pressure on  $EF$  is now removed. There will therefore be a tendency in the vessel to move back in the direction  $E, e$ . And this tendency must be precisely equal and opposite to the whole effort of the expelling forces. This is a conclusion as evident as any proposition in mechanics. It is then that a gun recoils and a rocket rises in the air; and on this is founded the operation of Mr Parents or Dr ... described in all treatises of mechanics, and more fully treated by Euler in the Berlin Memoirs.

Now, let this stream of water be received on a circular plane  $MN$ , perpendicular to its axis, and let this circular plane be of such extent, that the vein escapes from its sides in an infinitely thin sheet, the water flowing off in a direction parallel to the plane. The vein by this means will expand into a trumpet-like shape, having curved sides,  $EKG, FLH$ . We abstract at present the action of gravity which would cause the vein to bend downwards, and occasion a greater velocity at  $H$  than at  $G$ ; and we suppose the velocity equal in every point of the circumference. It is plain, that if the action of gravity be neglected after the water has issued through the orifice  $EF$ , the velocity in every point of the circumference of the plane  $MN$  will be that of the efflux through  $EF$ .

Now, because  $EKG$  is the natural shape assumed by the vein, it is plain, that if the whole vein were covered by a tube or mouth-piece, fitted to its shape, and perfectly polished, so that the water shall glide along it, without any friction (a thing which we may always suppose), the water will exert no pressure whatever on this trumpet mouth-piece. Lastly, Let us suppose that the plane  $MN$  is attached to the mouth-piece by some bits of wire, so as to allow the water to escape all round by the narrow chink between the mouth-piece and the plane: We have now a vessel consisting of the upright part  $ABDC$ , the trumpet  $GKEFLH$ , and the plane  $MN$ ; and the water is escaping from every point of the circumference of the chink  $GHNM$  with the velocity  $v$ . If any part of this chink were shut up, there would be a pressure on that part equivalent to the force of efflux from the opposite part. Therefore, when all is open, these efforts of efflux balance each other all round. There is not therefore any tendency in this compound vessel to move to any side. But take away the plane  $MN$ , and there would immediately arise a pressure in the direction  $E, e$  equal to the weight of the column  $a, e, f$ . This is therefore balanced by the pressure on the plane  $MN$ , which is therefore equal to this weight, and the proposition is demonstrated.

A number of experiments were made by Professor Kest at St Petersburg, by receiving the vein on a plane  $MN$  (fig. 11.) which was fastened to the arm of a balance  $OPQ$ , having a scale  $R$  hanging on the opposite arm. The resistance or pressure on the plane was measured by weights put into the scale  $R$ ; and the velocity of the jet was measured by means of the distance  $KI$ , to which it spouted on a horizontal plane.

The.

Now let  $ABDC$  (fig. 11.) be a quadrangular vessel with upright plane sides, in one of which is an orifice  $EF$ . From every point of the circumference of this

and experi-  
ments ac-  
counted  
for.

The results of these experiments were as conformable to the theory as could be wished. The resistance was always a little less than what the theory required, but greatly exceeded its half, the result of the generally received theories. This defect should be expected; for the demonstration supposes the plane MN to be infinitely extended, so that the film of water which issues through the chink may be accurately parallel to the plane. This never can be completely effected. Also it was supposed, that the velocity was justly measured by the amplitude of the parabola EGK. But it is well known that the very putting the plane MN in the way of the jet, tho' at the distance of an inch from the orifice, will diminish the velocity of the efflux through this orifice. This is easily verified by experiment. Observe the time in which the vessel will be emptied when there is no plane in the way. Repeat the experiment with the plane in its place; and more time will be necessary. The following is a note of a course of experiments, taken as they stand, without any selection.

In order to demonstrate this proposition in such a manner as to furnish the means of investigating the whole mechanism and action of moving fluids, it is necessary to premise an elementary theorem of curvilinear motions.

Plate  
ccccxxv.

If a particle of matter describes a curve line ABCE (fig. 13.) by the continual action of deflecting forces, which vary in any manner, both with respect to intensity and direction, and if the action of these forces, in every point of the curve, be resolved into two directions, perpendicular and parallel to the initial direction AK; then,

1. The accumulated effect of the deflecting forces, estimated in a direction AD perpendicular to AK, is to the final quantity of motion as the sine of the final change of direction is to radius.

53  
His propo-  
sition de-  
monstrated.

Let us first suppose that the accelerating forces act by starts, at equal intervals of time, when the body is in the points A, B, C, E. And let AN be the deflecting force, which, acting at A, changes the original direction AK to AB. Produce AB till BH=AB, and complete the parallelogram BFCH. Then FB is the force which, by acting at B, changed the motion BH (the continuation of AB) to BC. In like manner make Ch (in BC produced) equal to BC, and complete the parallelogram CfEh. Cf is the deflecting force at C, &c. Draw BO parallel to AN, and GBK perpendicular to AK. Also draw lines through C and E perpendicular to AK, and draw through B and C lines parallel to AK. Draw also HI, perpendicular, and FG, HI, *h i*, parallel to AK.

It is plain that BK is BO or AN estimated in the direction perpendicular to AK, and that *h i* is also estimated in the same way. And since BH=AB, HL or IM is equal to BK. Also CI is equal to BG. Therefore CM is equal to AP+BG. By similar reasoning it appears that  $E_m = E_i + h_i = C_g + CM = C_g + BG + AP$ .

Therefore if CE be taken for the measure of the final velocity or quantity of motion,  $E_m$  will be the accumulated effect of the deflecting forces estimated in the direction AD perpendicular to AK. But  $E_m$  is

to CE as the sine of  $m$  CE is to radius; and the angle  $m$  CE is the angle contained between the initial and final directions, because Cm is parallel to AK. Now let the intervals of time diminish continually and the frequency of the impulses increase. The deflection becomes ultimately continuous, and the motion curvilinear, and the proposition is demonstrated.

We see that the initial velocity and its subsequent changes do not affect the conclusion, which depends entirely on the final quantity of motion.

2. The accumulated effect of the accelerating forces, when estimated in the direction AK of the original motion, or in the opposite direction, is equal to the difference between the initial quantity of motion and the product of the final quantity of motion by the cosine of the change of direction.

$$\begin{aligned} \text{For } C_m &= C l - m l, = BM - f g \\ BM &= BL - ML, = AK - FG \\ AK &= AO - OK, = AO - PN. \end{aligned}$$

Therefore  $PN + FG + l o$  (the accumulated impulse in the direction OA)  $= AO - CM, = AO - CE \times \cosine \text{ of } \angle CEA$ .

Cor. 1. The final action in the direction opposite to that of the original motion, is necessary for causing a body to move at right angles to its former direction, or for stopping its motion. For in this case, the cosine of the change of direction is = 0, and  $AO - CE$  becomes  $ECM = AO - 0, = AO, = \text{the original motion}$ .

Cor. 2. If the initial and final velocities are the same, the accumulated action of the accelerating forces, estimated in the direction OA, is equal to the product of the original quantity of motion by the cosine of the change of direction.

The application of these theorems, particularly the second, to our present purpose is very obvious. All the filaments of the jet were originally moving in the direction of its axis, and they are finally moving in the direction of the resisting plane, or perpendicular to the initial direction. Therefore their transverse forces in the direction of the axis are (in cumulo) equal to the force which would stop the motion. For the magnitude of the final transverse forces of every particle, in the whole filament, is the same with that of the successive forces of one particle, as it arrives at different points of its curvilinear path. All the transverse forces, estimated in a direction perpendicular to the axis of the jet, precisely balance and sustain each other, and the only forces which can produce a sensible effect are those in a direction parallel to the axis. By these all the inner filaments are pressed towards the plane MN, and must be withstood by it. It is not probable, say certain, that there is a quantity of stagnant water in the middle of the vein which sustains the motion of the moving filaments without it, and presses it to the solid plane. But this does not alter the result. And, fortunately, it is of no consequence what changes happen in the velocities of the particles while each is describing its own curve. And it is from this circumstance, peculiar to this particular case of perpendicular impulse, that we are able to draw the conclusion. It is by no means difficult to demonstrate that the velocity of the external surface of this jet is constant, and indeed of every jet which is not acted on by external forces after it has quitted the orifice: but this discussion is quite unnecessary here. It is however extremely difficult to ascertain, even in this most simple case,

case, what is the velocity of the internal filaments in the different points of their progress.

Such is the demonstration which M. Bernoulli has given of this proposition. Limited as it is, it is highly valuable, because derived from the true principles of hydraulics.

54  
His theory  
attempted  
in vain to  
be rendered  
general.

He hoped to render it more extensive and applicable to oblique impulses, when the axis AC of the vein (fig. 13. N° 2.) is inclined to the plane in an angle ACN. But here all the simplicity of the case is gone, and we are now obliged to ascertain the motion of each filament. It might not perhaps be impossible to determine what must happen in the plane of the figure, that is, in a plane passing through the axis of the vein, and perpendicular to the plane MN. But even in this case it would be extremely difficult to determine how much of the fluid will go in the direction EFG, and what will go in the path FLN, and to ascertain the form of each filament, and the velocity in its different points. But in the real case of this case, the water will dissipate from the centre C in every side; and we cannot tell in what proportions. Let us however consider a little what happens in the plane of the figure, and suppose that all the water goes either in the course EFG or in the course FLN. Let the quantities of water which take these two courses have the proportion  $a:b$ . Let  $v$  be the velocity at A,  $v_1$  be the velocity at G, and  $v_2$  be the velocity at L. Let  $\alpha$  and  $\beta$  be the sines of the angles of incidence at G and L. Then,  $v_1 = v \cos \alpha$ , and  $v_2 = v \cos \beta$ . Then, the pressure of the water on the plane in the direction EFG is  $\frac{1}{2} \rho a v_1^2$ , and the pressure of the water on the plane in the direction FLN is  $\frac{1}{2} \rho b v_2^2$ , and their sum is  $\frac{1}{2} \rho (a v_1^2 + b v_2^2)$ , which being multiplied by the sine of the angle of incidence, gives the pressure perpendicular to the plane MN =  $\frac{1}{2} \rho (a v_1^2 \cos \alpha + b v_2^2 \cos \beta)$ .

But there remains a pressure in the direction perpendicular to the axis of the vein, which is not balanced, as in the former case, by the equality of the pressures on either side of the axis. The pressure arising from the water which escapes at G has an effect opposite to that produced by the water which escapes at L. When this is taken into account, we shall find that the forces perpendicular to AC are  $\frac{\rho - \pi}{\rho + \pi} \times 2a \sqrt{1 - \alpha^2}$ , being multiplied by the cosine of ACM, gives the action perpendicular to MN =  $\frac{\rho - \pi}{\rho + \pi} \times 2ac \sqrt{1 - \alpha^2}$ .

The sum or joint effect of all these pressures is  $\frac{\rho \times 2a - 2cb + \pi \times 2a + 2cb}{\rho + \pi} \sqrt{1 - \alpha^2} + \frac{\rho - \pi}{\rho + \pi} \times 2ac \sqrt{1 - \alpha^2}$ .

Thus, from this case, which is much simpler than can happen in nature, seeing that there will always be a latter efflux, the determination of the impulse is as uncertain and vague as it was sure and precise in the former case.

It is therefore without proper authority that the absolute impulse of a vein of fluid on a plane which receives it wholly, is asserted to be proportional to the sine of incidence. If indeed we suppose the velocity in G and H are equal to that at A, then  $b = a$ , and the whole impulse is  $2a \sqrt{1 - \alpha^2}$ , as is commonly supposed. But this cannot be. Both the velocity and quantity at H are less than those at G. Nay, frequently there is no efflux at the side H when the obliquity is very great. We may conclude in general, that the oblique impulse will always bear to the direct impulse a greater proportion than that of the sine of incidence to the sine. If the whole water escapes at G, and none goes off laterally, the pressure will be  $2a + 2ac - 2bc \times \sqrt{1 - \alpha^2}$ . The experiments of the Abbé Bossut show in the plainest manner that the pressure of a vein, striking obliquely on a plane which receives it wholly, diminishes faster than in the ratio of the square of the sine of incidence; whereas, when the oblique plane is wholly immersed in the stream, the impulse is much greater than in this proportion, and in great obliquities is nearly as the sine.

Nor will this proposition determine the impulse of a fluid on a plane wholly immersed in it, even when the impulse is perpendicular to the plane. The circumstance is now wanting on which we can establish a calculation, namely, the angle of final deflection. Could this be ascertained for each filament, and the velocity of the filament, the principles are completely adequate to an accurate solution of the problem. In the experiments which we mentioned to have been made under the inspection of Sir Charles Knowles, a cylinder of six inches diameter was exposed to the action of a stream moving precisely one foot per second; and when certain deductions were made for the water which was held adhering to the posterior base (as will be noticed afterwards), the impulse was found equal to  $3\frac{1}{2}$  ounces avoirdupois. There were 36 coloured filaments distributed on the stream, in such situations as to give the most useful indications of their curvature. It was found necessary to have some which passed under the body and some above it; for the form of these filaments, at the same distance from the axis of the cylinder, was considerably different; and those filaments which were situated in planes neither horizontal nor vertical took a double curvature. In short, the curves were all traced with great care, and the deflecting forces were computed for each, and reduced to the direction of the axis; and they were summed up in such a manner as to give the impulse of the whole stream. The deflections were marked as far as they could be assuredly observed. By this method the impulse was computed to be 215 ounces, differing from observation  $\frac{1}{6}$  of an ounce. The error of the whole; a difference which may most reasonably be ascribed to the adhesion of the water, which would be most sensible in such small velocities. These experiments may therefore be considered as giving all the confirmation that can be desired of the justness of the principles. This indeed hardly admits of a doubt: but, alas! it gives us but small assistance; for all this is empirical, in as far as it leaves us in every case the task of observing the form of the curves and the velocities in their different points. To derive service from this most judicious method of Daniel Bernoulli, we must discover some method of determining,

*a priori,*

Resistance attend to one half, and we shall consider these in a state of permanency.

No body changes either its direction or velocity otherwise than by insensible degrees: therefore the particle which is moving in the axis will not reach the vertex A of the body, where it behoved to deflect instantaneously at right angles. It will therefore begin to be deflected at some point F, a-head of the body, and will describe a curve FM, touching the axis at F, and the body in M; and then, gliding along the body, will quit it at some point L, describing a curve LN, which will join the axis again (touching it at N), and thus there will be a quantity of fluid, either before or a-head of the body, and another behind or after of it.

Let  $a$  be the velocity of a particle of the fluid in any instant, and  $a'$  its velocity in the next instant. The velocity  $a$  may be considered as compounded of  $a''$  and  $a'''$ . If the particles tended to move with the velocities  $a''$  only, the whole fluid would be in equilibrio (general principle), and the pressure of the fluid would be the same as if all were stagnant, and each particle were

urged by a force  $\frac{a''}{t}$ ,  $t$  expressing an indefinitely small moment of time. ( $N. B.$   $\frac{a''}{t}$  is the proper expression of

the accelerating force, which, by acting during the moment  $t$ , would generate the velocity  $a''$ ; and  $a''$  is supposed an indeterminate quantity, different perhaps for each particle). Now let  $a$  be supposed constant, or  $a = a'$ . In this case  $a'' = 0$ . That is to say, no pressure whatever will be exerted on the solid body unless there happen changes in the velocities or directions of the particles.

Let  $a$  and  $a'$  then be the motions of the particles in two consecutive instants. They would be in equilibrio if urged only by the forces  $\frac{a''}{t}$ . Therefore if  $\gamma$  be the

point where the particles which describe the curve FM begin to change their velocity, the pressure in D would be equal to the pressure which the fluid contained in the canal  $\gamma$  FMD would exert, if each particle were solicited

by its force  $\frac{a''}{t}$ . The question is therefore reduced to the finding the curvature in the canal  $\gamma$  FMD, and the accelerating forces  $\frac{a''}{t}$  in its different parts.

It appears, in the first place, that no action is exerted by any of the particles along the curve FM, and suppose that the particle  $a$  (fig. 17) describes the indefinitely small straight line  $ab$  in the first instant; and  $bc$  in the second instant; produce  $aF$  till it meets the line  $dc$ , the motion  $ab$  or  $b$  may be considered as compounded of  $bc$ , which the particle really describes in the next instant; and a motion  $bd$  which is perpendicular to  $bc$ . Draw  $bi$  parallel to  $dc$ , and  $ie$  perpendicular to  $bc$ . It is plain that the particle  $b$ , together with the fluid  $bc$ ,  $i$  (equivalent to  $bd$ ) should be in equilibrio. This being established,  $be$  must be  $= 0$ , that is, there will be no accelerating or retarding force at  $b$ ; for if there be, draw  $bm$  (fig. 18) perpendicular to  $bf$ , and the parallel  $ng$  infinitely near it. The part  $bn$  of the fluid contained in the canal  $bn$   $gm$  would sustain some pressure from  $b$  towards  $n$ , or from  $n$  towards  $b$ . Therefore

since the fluid in this stagnant canal should be in equilibrio, there must also be some action, at least in one of the parts  $bm$ ,  $mg$ ,  $gn$ , to counterbalance the action on the part  $bn$ . But the fluid is stagnant in the space FAM (in consequence of the law of continuity). Therefore there is no force which can act on  $bm$ ,  $mg$ ,  $gn$ ; and the pressure in the canal in the direction  $bn$  or  $ng$  is nothing, or the force  $be = 0$ , and the force  $ie$  is perpendicular to the canal; and there is therefore no pressure in the canal FM, except what proceeds from the part  $\gamma$  F, or from the force  $ei$ ; which last being perpendicular to the canal, there can be no force exerted on the point M, but what is propagated from the part  $\gamma$  F.

The velocity therefore in the canal FM is constant in nature, or infinitely small if variable: for, in the first case, the force  $ie$  would be absolutely nothing; and in the second case, it would be an infinitesimal of the second order, and may be considered as nothing in comparison with the velocity, which is of the first order. We shall see by and by that the last is the real state of the case. Therefore the fluid, before it begins to change its direction, begins to change its velocity in some point  $\gamma$  a-head of F, and by the time that it reaches F, its velocity is as it were annihilated.

Cor. Therefore the fluid is in any point  $\gamma$  urged both from the resistance in the part  $\gamma$  F, and from the particles which are in the canal FMD, and which move along the surface of the body, the fluid is destroyed in every particle, a compound motion, one in the direction of the surface, and another perpendicular to it; and these two motions are compounded perpendicularly to the surface of the body, the forces  $p$  in the curve FMD, etc. being resolved into the angle point D. The whole question is, in comparison of the resistance in the part  $\gamma$  F, and therefore taking in the axis  $ab$ , and the velocity in the portion  $FM$ , etc. the pressure in the canal FMD, etc. will be equal to the pressure in the part  $\gamma$  F, and the fluid will be in equilibrio.

ent must be taken as to be  $= 0$ , the pressure in the canal FMD, etc. being resolved into the angle point D, we shall find the force  $p$  on any point  $p$ . Let  $\gamma$  be the velocity of the particle  $a$  in the direction  $FM$  in any instant, and  $a'$  the velocity in the following instant. The whole question is, in comparison of the resistance in the part  $\gamma$  F, and the velocity in the portion  $FM$ , etc. the pressure in the canal FMD, etc. will be equal to the pressure in the part  $\gamma$  F, and the fluid will be in equilibrio.

ent must be taken as to be  $= 0$ , the pressure in the canal FMD, etc. being resolved into the angle point D, we shall find the force  $p$  on any point  $p$ . Let  $\gamma$  be the velocity of the particle  $a$  in the direction  $FM$  in any instant, and  $a'$  the velocity in the following instant. The whole question is, in comparison of the resistance in the part  $\gamma$  F, and the velocity in the portion  $FM$ , etc. the pressure in the canal FMD, etc. will be equal to the pressure in the part  $\gamma$  F, and the fluid will be in equilibrio.

ent must be taken as to be  $= 0$ , the pressure in the canal FMD, etc. being resolved into the angle point D, we shall find the force  $p$  on any point  $p$ . 62  
from the  
imperfect  
state of  
mathema-  
tics, it is  
useless.

no use. So imperfect is our mathematical knowledge, that even Mr d'Alembert has not been able to exemplify the application of the equation to the simplest case which can be proposed, such as the direct impulse on a plane surface wholly immersed in the fluid. All that he is enabled to do, is to apply it (by some modifications and substitutions which take it out of its state of extreme generality) to the direct impulse of a vein of fluid on a plane which deflects it wholly, and thus to show its conformity to the solution given by Daniel Bernouilli, and to observation and experience. He shows, that this impulse (independent of the deficiency arising from the plane's not being of infinite extent) is somewhat less than the weight of a column whose base is the section of the vein, and whose height is twice the fall necessary for communicating the velocity. This great philosopher and geometer concludes by saying, that he does not believe that any method can be found for solving this problem that is more direct and simple; and imagines, that if the objection from it shall be found not to agree with experiment, we must give up all hopes of determining the resistance of fluids by theory and analytical calculus. He says *analytical calculus*; for all the physical principles in which the calculus proceeds are rigorously demonstrated, and will not admit of a doubt. There is only one hypothesis introduced in this demonstration, and this is not a physical hypothesis, but a hypothesis of calculation. It is, that the velocities are in the ratio of the second powers of the directions, estimated in the directions parallel and perpendicular to the axis AC (fig. 16.) or, in other words, the velocity AP and ordinate PM of the parabola, at any point P, is the least acquainted with the nature of fluids. We feel that without this supposition, we cannot calculate whatever can be instituted. But let us see what is the physical meaning of this hypothesis. It is simply this, that the motion of the particles is dependent on its situation only. It appears impossible to form any other opinion; and if we could form such an opinion, it is as clear as day-light that this is impossible, and that we must renounce all hopes.

63  
Mathema-  
ticians  
should ap-  
ply to  
simple  
cases;

We are sorry to bring our labours to this conclusion; but we are of opinion, that the only thing that remains is, for mathematicians to attach themselves with firmness and vigour to some simple cases; and, without aiming at generality, to apply Mr d'Alembert's or Bernouilli's mode of procedure to the particular circumstances of the case. It is not impossible but that, in the solutions which may be obtained of these particular cases, circumstances may occur which are of a more general nature. These will be so many laws of resistance to be added to our present very scanty stock, and these may have points of resemblance, which will give birth to laws of still greater generality. And we repeat our expression of hopes of some success, by endeavouring to determine, in some simple cases, the minimum possible of motion. The attempts of the Jesuit commentators on the *Principia* to ascertain this on the Newtonian hypothesis do them honour, and have really given us great assistance in the particular case which came through their hands.

64  
and multi-  
ply experi-  
ments.

And we should multiply experiments on the resistance of bodies. Those of the French academy are undoubtedly of inestimable value, and will always be ap-

pealed to. But there are circumstances in those experiments which render them more complicated than is proper for a general theory, and which therefore limit the conclusions which we wish to draw from them. The bodies were floating on the surface. This greatly modifies the deflections of the filaments of water, causing some to deflect laterally, which would otherwise have remained in one vertical plane; and this circumstance also necessarily produced what the academicians called the *resistance* or accumulation on the anterior part of the body, and the depression behind it. This produced an additional resistance, which was measured with great accuracy. The effect of adhesion must also have been very considerable, and very different in the different cases; and it is of difficult calculation. It cannot possibly be totally removed in any experiment, and it is necessary to consider it as making part of the resistance in the most important practical cases, viz. the motion of ships. Here we see that its effect is very great. Every seaman knows that the speed, even of a copper-sheathed ship, is greatly increased by greasing her bottom. The difference is too remarkable to admit of a doubt: nor should we be surprised at this, when we attend to the diminution of the motion of water in long pipes. A smooth pipe four and a half inches diameter, and 500 yards long, yields but one-fifth of the quantity which it ought to do independent of friction. But adhesion does a great deal which cannot be compared with friction. We see that water flowing through a hole in a thin plate will be increased in quantity fully one-third, by adding a little tube whose length is about twice the diameter of the hole. The adhesion therefore will greatly modify the action of the filaments both on the solid body and on each other, and will change both the forms of the curves and the velocities in different points; and this is a sort of objection to the only hypothesis introduced by d'Alembert. Yet it is only a sort of objection; for the effect of this adhesion, too, must undoubtedly depend on the situation of the particle.

The form of these experiments of the academy is ill-suited to the examination of the resistance of bodies wholly immersed in the fluid. The form of experiment adopted by Robins for the resistance of air, and afterwards by the Chevalier Borda for water, is free from these inconveniences, and is susceptible of equal accuracy. The great advantage of both is the exact knowledge which they give us of the velocity of the motion, a circumstance essentially necessary, and but imperfectly known in the experiments of Mariotte and others, who examined quiescent bodies exposed to the action of a stream. It is extremely difficult to measure the velocity of a stream. It is very different in the different parts. It is swiftest of all in the middle of the stream, and diminishes as we recede from the middle towards the sides or bottom, and the rate of diminution is not precisely known. Could this be ascertained with the necessary precision, we should recommend the following form of experiment as the most simple, easy, economical, and accurate.

Let *a, b, c, d*, (fig. 19. be four hooks placed in a horizontal plane at the corners of a rectangular parallelogram, the sides *ac, bd* being parallel to the direction of the stream ABCD, and the sides *ab, cd* being perpendicular to it. Let the body G be fastened to

Plate  
ccccxxxii.  
66  
simple ex-  
periment  
for measur-  
ing the  
velocity of  
an a stream.

**Resistance.** an axis  $s f$  of stiff-tempered steel-wire, so that the surface on which the fluid is to act may be inclined to the stream in the precise angle we desire. Let this axis have hooks at its extremities, which are hitched into the loops of four equal threads, suspended from the hooks  $a, b, c, d$ ; and let  $H$  be a fifth thread, suspended from the middle of the line joining the points of suspension  $a, b, c, d$ . Let  $H I K$  be a graduated arch, whose centre is  $H$ , and whose plane is in the direction of the stream. It is evident that the height of the body  $Q$  will be measured (by a process well known to every mathematician) by the deviation of the thread  $H I$  from the vertical line  $H I$ ; and this will be done without any intricacy of calculation, or any attention to the centres of gravity, of oscillation, or of percussion. These must be accurately ascertained with respect to the form in which the pendulum has always been employed for measuring the impulse or velocity of a stream. These advantages arise from the circumstance, that the axis  $s f$  remains always parallel to the horizon. We may be allowed to observe, by the by, that this would have been a great improvement of the beautiful experiments of Mr Robins and Dr Hutton on the velocities of cannon-shot, and would have saved much intricate calculation, and been attended with many important advantages.

The great difficulty is, as we have observed, to measure the velocity of the stream. Even this may be done in this way with some precision. Let two floating bodies be dragged along the surface, as in the experiments of the academy, at some distance from each other laterally, so that the water between them may not be sensibly disturbed. Let a horizontal bar be attached to them, transverse to the direction of their motion, at a proper height above the surface, and let a spherical pendulum be suspended from this, or let it be suspended from four points, as here described. Now let the deviation of this pendulum be noted in a variety of velocities. This will give us the law of relation between the velocity and the deviation of the pendulum. Now, in making experiments on the resistance of bodies, let the velocity of the stream, in the very filament in which the resistance is measured, be determined by the deviation of this pendulum.

It were greatly to be wished that some more palpable argument could be found for the existence of a quantity of stagnant fluid at the anterior and posterior parts of the body. The one already given, derived from the consideration that no motion changes either its velocity or direction by finite quantities in an instant, is unexceptionable. But it gives us little information of the smallest conceivable extent of the curve  $E M$  in fig. 10. It will answer this condition, provided only that it touches the axis in some point  $F$ , and the body in some point  $M$ , so as not to make a finite angle with either. It is surely there are circumstances which necessarily determine the extent of this stagnant fluid. And it is without doubt, that if there were no cohesion or adhesion, this space will have a determined ratio to the size of the body (the figures of the bodies being supposed similar.) Suppose a plane surface  $A B$ , as in fig. 10, there can be no doubt but that the figure  $A O D$  &  $B$  will in every case be similar. But if we suppose an adhesion or tenacity which is constant, this may make a change both in its extent and its form; for its con-

stancy of form depends on the disturbing forces being always as the squares of the velocity; and this ratio of the disturbing forces is preserved, while the inertia of the fluid is the only agent and patient in the process. But when we add to this the constant (that is, invariable) disturbing force of tenacity, a change of form and dimensions must happen. In like manner, the friction, or something analogous to friction, which produces an effect proportional to the velocity, must alter this necessary ratio of the whole disturbing forces. We may conclude, that the effect of both these circumstances will be to diminish the quantity of this stagnant fluid, by licking it away externally; and to this we must add the fact, that the part  $F A M$  is never perfectly stagnant, but is generally disturbed with a whirling motion. We may also conclude, that this stagnant fluid will be more incased between  $F$  and  $M$  than it would have been independent of tenacity and friction; and that the arch  $E M$  will, on the contrary, be less incased. And, lastly, we may conclude, that there will be something opposite to pressure, or something which we may call adhesion, exerted on the posterior part of the body, which moves in a tenacious fluid, or is exposed to the stream of such a fluid; for the stagnant fluid  $L C K$  adheres to the surface  $L C$ ; and the passing fluid tends to draw it away both by its tenacity and by its friction. This must augment the apparent impulse of the stream on such a body, and it must greatly augment the resistance, that is, the motion lost by this body in its progress thro' the tenacious fluid; for the body must drag along with it this stagnant fluid, and drag it in opposition to the tenacity and friction of the surrounding fluid. The effect of this is made remarkably seen in the resistance to the motion of pendulums; and the chevalier Buis, in his examination of Newton's experiments, clearly shows that this constitutes the greatest part of the resistance.

This most ingenious writer has paid great attention to this part of the process of nature, and has laid the foundation of a theory of resistance entirely different from all the preceding. We cannot at present say it is too imperfect in its present condition to be offered as a body of argument; but we hope that the ingenious author will prosecute the subject.

We cannot conclude this dissertation (which we acknowledge to be very unsatisfactory and imperfect) better, than by giving an account of some experiments of the chevalier Buis, which seem of immense consequence, and are to give us very new views of the subject. Buis observed the motion of water issuing from a glass cylinder through a narrow ring formed by a cylinder of smaller diameter; that is, the cylinder was open at both ends, and there was placed at its lower end a circle of smaller diameter, by way of bottom, which left a ring all around. He threw some powder, or sealing wax into the water, and observed with great attention the motion of its small particles. He saw those which happened to be in the very axis of the cylinder descend along the axis with a motion pretty uniform, till they came very near the bottom; from this they continued to descend very slowly, till they were almost in contact with the bottom; they then deviated from the centre, and approached the orifice in a straight

*Resistance* straight lines and with an accelerated motion, and at last darted into the orifice with great rapidity. He had observed a thing similar to this in a horizontal canal, in which he had set up a small board like a dam or bar, over which the water flowed. He had thrown a gooseberry into the water, in order to measure the velocity at the bottom, the gooseberry being a small matter heavier than water. It approached the dam uniformly about three inches from it. Here it almost stood still, but it continued to advance till almost in contact. It then rose from the bottom along the inside of the dam with an accelerated motion, and quickly escaped over the top.

Hence he concluded that the water which covers the anterior part of the body exposed to the stream is not perfectly stagnant, and that the filaments recede from the axis in curves, which converge to the surface of the body as different hyperbolæ converge to the same asymptote, and that they move with a velocity continually increasing till they escape round the sides of the body.

He had established (by a pretty reasonable theory, confirmed by experiment) a proposition concerning the pressure which water in motion exerts on the surface along which it glides; *viz.* that the pressure is equal to that which in would exert if at rest within the weight of the column whose height would produce the velocity of the passing stream. Consequently the pressure which the stream exerts on the surface perpendicularly exposed to it will depend on the velocity with which it glides along it, and will diminish from the centre to the circumference. This, I apprehend, may be the reason why the impulse on a plane wholly immersed is but one half of that on a plane which deflects the whole stream.

68  
and of the  
instrument  
he contri-  
ved for exa-  
mining his  
theory.

He constructed a very ingenious instrument for examining this theory. A square brass plate ABGF (fig. 20.) was pierced with a great number of holes, and fixed in the front of a shallow box represented edgewise in fig. 21. The back of the box was pierced with a hole *e*, in which was inserted the tube of glass CDE, bent square at D. This instrument was exposed to a stream of water, which beat on the brass plate. The water having filled the box through the holes, stood at an equal height in the glass tube when the surrounding water was stagnant; but when it was in motion, it always stood in the tube above the level of the stagnant water without, and thus indicated the pressure occasioned by the action of the stream.

When the instrument was not wholly immersed, there was always a considerable accumulation against the front of the box, and a depression behind it. The water before it was by no means stagnant: indeed it *spoke* as Mr Buat observes; for it consists of the water which was escaping on all sides, and therefore upwards from the axis of the stream, which meets the plate perpendicularly in a considerable under the surface. It escapes upwards; and if the body were sufficiently immersed, it would escape in this direction almost as easily as laterally. But in the present circumstances, it heaped up, till the elevation occasions it to fall off sideways as fast as it is renewed. When the instrument was immersed more than its semidiameter under the surface, the water still rose above the level, and there was a great depression immediately behind this elevation. In consequence of this difficulty of escaping upwards, the wa-

ter flows off laterally; and if the horizontal dimension of the surface is great, this lateral efflux becomes more difficult, and requires a greater accumulation. From this it happens, that the resistance of broad surfaces equally immersed is greater than in the proportion of the breadth. A plane of two feet wide and one foot deep, when it is not completely immersed, will be more resisted than a plane two feet deep and one foot wide; for there will be an accumulation against both: and even if these were equal in height, the additional surface will be greatest in the widest body; and the elevation will be greater, because the lateral escape is more difficult.

The circumstances chiefly to be attended to are these:—

The pressure on the centre was much greater than towards the border, and, in general, the height of the water in the tube DE was more than  $\frac{1}{4}$  of the height necessary for producing the velocity when only the central hole was open. When various holes were opened at different distances from the centre, the height of the water in DH continually diminished as the hole was nearer the border. At a certain distance from the border the water at E was level with the surrounding water, so that no pressure was exerted on that hole. But the most unexpected and remarkable circumstance was, that, in great velocities, the holes at the very border, and even to a small distance from it, not only sustained no pressure, but even gave out water; for the water in the tube was lower than the surrounding water. Mr Buat calls this a *non-pressure*. In a case in which the velocity of the stream was three feet, and the pressure on the central hole caused the water in the vertical tube to stand 33 lines or  $\frac{1}{4}$  of an inch above the level of the surrounding smooth water, the action on a hole at the lower corner of the square caused it to stand 12 lines lower than the surrounding water. Now the velocity of the stream in this experiment was 36 inches per second. This requires 21  $\frac{1}{2}$  lines for its productive fall; whereas the pressure on the central hole was 33. This approaches to the pressure on a surface which deflects it wholly. The intermediate holes gave every variation of pressure, and the diminution was more rapid as the holes were nearer the edge; but the law of diminution could not be observed.

This is quite a new and most unexpected circumstance in the action of fluids on solid bodies, and renders the subject more intricate than ever; yet it is by no means inconsistent with the genuine principles of hydrostatics or hydraulics. In as far as Mr Buat's proposition concerning the pressure of moving fluids is true, it is very reasonable to say, that when the lateral velocity with which the fluid tends to escape exceeds the velocity of percussion, the height necessary for producing this velocity must exceed that which would produce the other, and a non-pressure must be observed. And if we consider the forms of the lateral filaments near the edge of the body, we see that the concavity of the curve is turned towards the body, and that the centrifugal forces tend to diminish their pressure on the body. If the middle alone were struck with considerable velocity, the water might even rebound, as is frequently observed. This actual rebounding is here prevented by the surrounding water, which is moving with the same velocity: but the

theory.

Part and perhaps a considerable part) of this apparent non-pressure is undoubtedly produced by the tenacity of the water, which sticks off with it the water lying in the hole. But, at any rate, this is an important fact, and gives great value to these experiments. It gives a key to many curious phenomena in the resistance of fluids; and the theory of Mr Buat deserves a very serious consideration, and is contained in the two following propositions.

1. "If, by any cause whatever, a column of fluid, whether making part of an indefinite fluid, or contained in solid canals, comes to move with a given velocity, the pressure which it exerts laterally before its motion, either on the adjoining fluid or on the sides of the canals, is diminished by the weight of a column having the height necessary for communicating the velocity of the motion."

2. "The pressure on the centre of a plane surface perpendicular to the stream, and wholly immersed in it is  $\frac{1}{2}$  of the weight of a column having the height necessary for communicating the velocity. For 33 is  $\frac{1}{2}$  of 21."

73  
Experiments by  
which it is  
confirmed.

He attempted to ascertain the medium pressure on the whole surface, by opening 625 holes dispersed all over it. With the same velocity of current, he found the height in the tube to be 29 lines, or  $7\frac{1}{2}$  more than the height necessary for producing the velocity. But he justly concluded this to be too great a measure, because the holes were  $\frac{1}{4}$  of an inch from the edge: had there been holes at the very edge, they would have sustained a non-pressure, which would have diminished the height in the tube very considerably. He exposed to the same stream a conical funnel, which raised the water to 34 lines. But this could not be considered as a measure of the pressure on a plane solid surface; for the central water was undoubtedly scooped out, as it were, and the filaments much more deflected than they would have been by a plane surface. Perhaps something of this happened even in every small hole in the former experiments. And this suggests some doubt as to the accuracy of the measurement of the pressure and of the velocity of a current by Mr Pitot's tube. It surely renders some corrections absolutely necessary. It is a fact, that when exposed to a vein of fluid coming through a short passage, the water in the tube stands on a level with that in the reservoir. Now we know that the velocity of this stream does not exceed what would be produced by a fall equal to  $\frac{1}{3}$  of the head of water in the reservoir. Mr Buat made many valuable observations and improvements on this method of experiment, which will be taken notice of in the *HYDRAULICS* and *WATER-WORKS*.

Mr Buat, by a scrupulous attention to all the circumstances, concludes, that the medium pressure on the whole surface is equal to  $\frac{25.5}{21.5}$  of the weight of a column, having the surface for its base, and the productive fall for its height. But we think that there is an uncertainty in this conclusion; because the height of the water in the vertical tube was undoubtedly augmented by an hydrostatical pressure arising from the accumulation of water above the body which was exposed to the stream.

Since the pressures are as the squares of the velocity,

ties, or as the heights  $h$  which produce the velocities, we may express this pressure by the symbol  $\frac{25.5}{21.5} h$ , or

$1.186h$ , or  $m h$ , the value of  $m$  being 1.186. This exceeds considerably the result of the experiments of the French academy. In these it does not appear that  $m$  sensibly exceeds unity. Note, That in these experiments the body was moved through still water; here it is exposed to a stream. These are generally supposed to be equivalent, on the authority of the third law of motion, which makes every action depend on the relative motions. We shall by and by see some causes of difference.

The writers on this subject seem to think their task completed when they have considered the action of the fluid on the anterior part of the body, or that part of it which is before the broadest section, and have paid little or no attention to the hinder part. Yet those who are most interested in the subject, the naval architects, seem to be convinced that it is of no less importance to attend to the form of the hinder part of a ship. And the universal practice of all nations has been to make the hinder part more acute than the fore part. This has undoubtedly been deduced from experience, for it is in direct opposition to any notions which a person would naturally form on this subject. Mr Buat therefore thought it very necessary to examine the action of the water on the hinder part of a body by the same method. And, previous to this examination, in order to acquire some scientific notions of the subject, he made the following very curious and instructive experiment.

Two little conical pipes A B (fig. 21.) were inserted into the upright side of a prismatic vessel. They were an inch long, and their diameters at the inner and outer ends were five and four lines: A was 57 lines under the surface, and B was 73. A glass syphon was made of the shape represented in the figure, and its internal diameter was 12 lines. It was placed with its mouth in the axis, and even with the base of the conical pipe. The pipes being shut, the vessel was filled with water, and it was made to stand on a level in the two legs of the syphon, the upper part being full of air. When the syphon was applied to the pipe A, and the water running freely, it rose 42 lines in the short leg, and sunk as much in the other. When it was applied to the pipe B, the water rose 41 lines in the one leg of the syphon, and sunk as much in the other.

He reasons in this manner from the experiment. The ring comprehended between the end of the syphon and the base of the conical tube being the narrowest part of the orifice, the water issued with the velocity corresponding to the height of the water in the vessel above the orifice, diminished for the contraction. If therefore the cylinder of water immediately before the mouth of the syphon issued with the same velocity, the vessel would be emptied through a height equal to this *head of water (charge)*. If, on the contrary, this cylinder of water, immediately before the mouth of the syphon, were stagnant, the water in it would exert its full pressure on the mouth of the syphon, and the water in the syphon would be level with the water in the vessel. Between these extremes we must find the real state of the case, and we must measure the force of non-pressure by the rise of the water in the syphon.

We see that in both experiments it bears an accurate proportion

**Resistance.**

74

The action of the fluid on the hinder part of a body or ship equally important with the action on the fore part.

75

Experiment on this subject by Buat, Plate XXXVI.

76

and his reasoning upon it.

Resistance proportion to the depth under the surface. For 57: 73 = 32: 41 very nearly. He therefore estimates the non-pressure to be  $\frac{1}{10}$  of the height of the water above the orifice.

77  
seemingly  
inaccurate:

We are disposed to think that the ingenious author has not reasoned accurately from the experiment. In the first place, the force indicated by the experiment, whatever be its origin, is certainly double of what he supposes; for it must be measured by the sum of the rise of the water in one leg, and its depression in the other, the weight of the air in the bend of the syphon being neglected. It is precisely analogous to the force acting on the water oscillating in a syphon, which is acknowledged to be the sum of the elevation and depression. The force indicated by the experiment therefore is  $\frac{1}{10}$  of the height of the water above the orifice. The force exhibited in this experiment bears a still greater proportion to the productive height; for it is certain that the water *did not* issue with the velocity acquired by the fall from the surface, and probably did not exceed  $\frac{1}{2}$  of it. The effect of contraction must have been considerable and uncertain. The velocity should have been measured both by the amplitude of the jet and by the quantity of water discharged. In the next place, we apprehend that much of the effect is produced by the tenacity of the water, which drags along with it the water which would have slowly issued from the syphon, had the other end not dipped into the water of the vessel. We know, that if the horizontal part of the syphon had been continued far enough, and if no retardation were occasioned by friction, the column of water in the upright leg would have accelerated like any heavy body; and when the last of it had arrived at the bottom of that leg, the whole in the horizontal part would be moving with the velocity acquired by falling from the surface. The water of the vessel which issues through the surrounding ring very quickly acquires a much greater velocity than what the water descending in the syphon would acquire in the same time, and it drags this last water along with it both by tenacity and friction, and it drags it out till its action is opposed by the want of equilibrium produced in the syphon, by the elevation in the one leg, and the depression in the other. We imagine that little can be concluded from the experiment with respect to the real non-pressure. Nay, if the sides of the syphon be supposed infinitely thin, so that there would be no curvature of the filaments of the surrounding water at the mouth of the syphon, we do not very distinctly see any source of non-pressure: For we are not altogether satisfied with the proof which Mr Buat offers for this measure of the pressure of a stream of fluid gliding along a surface, and obstructed by friction or any other cause. We imagine that the passing water in the present experiment would be a little retarded by accelerating continually the water descending in the syphon, and renewed again supposing the upper end open; because this water would not of itself acquire more than half this velocity. It however drags it out, till it not only resists with a force equal to the weight of the whole vertical column, but even exceeds it by  $\frac{1}{10}$ . This it is able to do, because the whole pressure by which the water issues from an orifice has been shown (by Daniel Bernoulli) to be equal to twice this weight. We therefore consider this beautiful experiment as chiefly valuable, by giving us

a measure of the tenacity of the water; and we wish Resistance that it were repeated in a variety of depths, in order to discover what relation the force exerted bears to the depth. It would seem that the tenacity, being a certain determinate thing, the proportion of 100 to 112 would not be constant; and that the observed ratio would be made up of two parts, one of them constant, and the other proportional to the depth under the surface.

But still, this experiment is intimately connected with the matter in hand; and this apparent non-pressure on the hinder part of a body exposed to a stream, from whatever causes it proceeds, does operate in the action of water on this hinder part, and must be taken into the account.

We must therefore follow the chevalier de Buat in his discussions on this subject. A prismatic body, having its prow and poop equal and parallel surfaces, and plunged horizontally into a fluid, will require a force to keep it firm in the direction of its axis precisely equal to the difference between the real pressures exerted on its prow and poop. If the fluid is at rest, this difference will be nothing, because the opposite dead pressures of the fluid will be equal: but in a stream, there is superadded to the dead pressure on the prow the active pressure arising from the deflections of the filaments of this fluid.

If the dead pressure on the poop remained in its full intensity by the perfect stagnation of the water behind it, the whole sensible pressure on the body would be the active pressure only on the prow, represented by  $mb$ . If, on the other hand, we could suppose that the water behind the body moved continually away from it (being renewed laterally) with the velocity of the stream, the dead pressure would be entirely removed from its poop, and the whole sensible pressure, or what must be opposed by some external force, would be  $mb + b$ . Neither of these can happen; and the real state of the case must be between these extremes.

The following experiments were tried: The perforated box with its vertical tube was exposed to the stream, the brass plate being turned down the stream. The velocity was again 36 inches per second.

The central hole A alone being opened gave a non-pressure of - - - 17 lines.

A hole B,  $\frac{1}{2}$  of an inch from the edge, gave - - - 15

A hole C, near the surface, - - - 15.7

A hole D, at the lower angle - - - 15.3

Here it appears that there is a very considerable non-pressure, increasing from the centre to the border. This increase undoubtedly proceeds from the greater lateral velocity with which the water is gliding in from the sides. The water behind was by no means stagnant, although moving off with a much smaller velocity than that of the passing stream, and it was visibly removed from the sides, and gradually licked away at its further extremity.

Another box, having a great number of holes, all open, indicated a medium of non-pressure equal to 13 lines.

Another of larger dimensions, but having fewer holes, indicated a non-pressure of 12  $\frac{1}{2}$ .

But the most remarkable, and the most important phenomena, were the following:

The first box was fixed to the side of another box.

**Resistance.** When the velocity is three feet per second, requiring the productive height 21.5 lines, the heights corresponding to the non-pressure on the poop of a thin plane is 14.41 lines (taking in several circumstances of judicious correction, which we have not mentioned), that of a foot cube is 5.83, and that of a box of triple length is 3.31.

Let  $q$  express the variable ratio of these to the height producing the velocity, so that  $q h$  may express the non-pressure in every case; we have,

For a thin plane  $q = 0.67$   
 a cube  $q = 0.271$   
 a box = 3 cubes  $q = 0.153$

It is evident that the value of  $q$  has a dependence on the proportion of the length, and the transverse section of the body. A series of experiments on prismatic bodies showed M. de Buat that the deviation of the filaments was similar in similar bodies, and that this obtained even in dissimilar prisms, when the lengths were as the square-roots of the transverse sections. Although therefore the experiments were not sufficiently numerous for deducing the precise law, it seemed not impossible to derive from them a very useful approximation. By a dexterous comparison he found that if  $l$  expresses the length of the prism, and  $s$  the area of the transverse section, and  $L$  represents the common logarithm of the quantity to which it is prefixed, we shall express the non-pressure pretty accurately by the formula  $\frac{1}{q} = L \frac{V}{2.2}$ .

Hence arises an important remark, that when the height corresponding to the non-pressure is greater than  $21.5$ , and the body is little immersed in the fluid, there will be a void behind it. Thus a surface of a square foot, just immersed in a current of three feet per second, will have a void behind it. A foot square will be in a similar condition when the velocity is 12 feet.

We must be careful to distinguish this non-pressure from the other causes of resistance, which are always necessarily combined with it. It is superadditive to the active impression on the prow, to the static pressure of the accumulation at head of the body, the static pressure arising from the depression behind it, the effects of friction and the effects of tenacity. It is indeed next to impossible to estimate them separately, and many of them are actually combined in the measures now given. Nothing can determine the pure non-pressures till we can ascertain the motions of the filaments.

83 He controverts a maxim universally adopted, that the pressure occasioned by a stream of fluid on a fixed body is the same with that on a body moving with equal velocity in a quiescent fluid. He repeated all these experiments with the perforated box in still water. The general distinction was, that both the pressure and the non-pressure in this case was less, and that the odds was chiefly to be observed near the edges of the surface. The general factor of the pressure of a stream on the anterior surface was  $m = 1.186$ ; but that on a body moving through a still fluid is only  $m = 1$ . He observed no non-pressure even at the very edge of the prow, but, even a sensible pressure. The pressure, therefore, or resistance is more equally diffused over the surface of the prow than the impulse is.—He also found that the resistance diminished in a less ratio than the squares of the velocities, especially in small velocities.

VOL. XVI. Part I.

The non-pressures increased in a greater ratio than the squares of the velocities. The ratio of the velocities to a small velocity of  $2\frac{1}{2}$  inches per second increased geometrically, the value of  $q$  increased arithmetically; and we may determine  $q$  for any velocity  $V$  by this proportion

$$L \frac{55}{2.2} : L \frac{V}{2.2} = 0.5 : q, \text{ and } q = \frac{L \frac{V}{2.2}}{2.8}$$
 That is, let the common logarithm of the velocity, divided by  $2\frac{1}{2}$ , be considered as a common number; divide this common number by  $2.8$ , the quotient is  $q$ , which must be multiplied by the productive height. The product is the pressure.

When Pitot's tube was exposed to the stream, we had  $m = 1$ ; but when it is carried through still water,  $m$  is  $= 1.22$ . When it was turned from the stream, we had  $q = 0.157$ ; but when carried through still water  $q$  is  $= 0.138$ . A remarkable experiment.

When the tube was moved laterally through the water and sup-  
 84 ports his opinion by a remarkable experiment.  
 He does not give the detail of the experiment, and only inserts the result in his table.

As a body exposed to a stream deflects the fluid, heaps it up, and increases its velocity; so a body moved through a still fluid turns it aside, causes it to swell up before it, and gives it a real motion alongside of it in the opposite direction. And as the body exposed to a stream has a quantity of fluid almost stagnant both before and behind; so a body moved through a still fluid carries before it and drags after it a quantity of fluid, which accompanies it with nearly an equal velocity. This addition to the quantity of matter in motion must make a diminution of its velocity; and this forms a very considerable part of the observed resistance.

85 We cannot, however, help remarking that it would require very distinct and strong proof indeed to overturn the common opinion, which is founded on our most certain and simple conceptions of motion, and on a law of nature to which we have never observed an exception. M. de Buat's experiments, tho' most judiciously contrived, and executed with scrupulous care, are by no means of this kind. They were, of absolute necessity, very complicated; and many circumstances, impossible to avoid or to appreciate, rendered the observation, or at least the comparison, of the velocities, very uncertain.

86 We can see but two circumstances which do not admit of an easy or immediate comparison in the two states of the problem. When a body is exposed to a stream in our experiments, in order to have an impulse made on it, there is a force tending to move the body backwards, independent of the real impulse or pressure occasioned by the deflection of the stream. We cannot have a stream except in consequence of a sloping surface. Suppose a body floating on this stream. It will not only sail down along with the stream, but it will sail down the stream, and will therefore go faster along the canal than the stream does; for it is floating on an inclined plane; and if we examine it by the laws of hydrostatics, we shall find, that besides its own tendency to slide down this inclined plane, there is an odds of hydrostatical pressure, which pushes it down this plane. It will therefore go along the canal faster than the stream. For this acceleration depends on the difference of pressure at the two ends, and will be more remarkable

Q

remarkable

**Resistance.** markable as the body is larger, and especially as it is longer. This may be distinctly observed. All floating bodies go into the stream of the river, because there they find the smallest obstruction to the acquisition of this motion along the inclined plane; and when a number of bodies are thus floating down the stream, the largest and longest outstrip the rest. A log of wood floating down in this manner may be observed to make its way very fast among the chips and saw-dust which float alongside of it.

Now when, in the course of our experiments, a body is supported against the action of a stream, and the impulse is measured by the force employed to support it, it is plain that part of this force is employed to act against that tendency which the body has to outstrip the stream. This does not appear in our experiment, when we move a body with the velocity of this stream through still water having a horizontal surface.

The other distinguishing circumstance is, that the retardations of a stream arising from friction are found to be nearly as the velocities. When, therefore, a stream moving in a limited canal is checked by a body put in its way, the diminution of velocity occasioned by the friction of the stream having already produced its effect, the impulse is not affected by it; but when the body puts the still water in motion, the friction of the bottom produces some effect, by retarding the recess of the water. This, however, must be next to nothing.

The chief difference will arise from its being almost impossible to make an exact comparison of the velocities: for when a body is moved against the stream, the relative velocity is the same in all the filaments. But when we expose a body to a stream, the velocity of the different filaments is not the same; because it decreases from the middle of the stream to the sides.

M. Buat found the total sensible resistance of a plate 12 inches square, and measured, not by the height of water in the tube of the perforated box, but by weights acting on the arm of a balance, having its centre 15 inches under the surface of a stream moving three feet per second, to be 19.46 pounds; that of a cube of the same dimensions was 15.22; and that of a prism three feet long was 13.87; that of a prism six feet long was 14.27. The three first agree extremely well with the determination of  $m$  and  $q$ , by the experiments with the perforated box. The total resistance of the last was undoubtedly much increased by friction, and by the retrograde force of so long a prism floating in an inclined stream. This last by computation is 0.273 pounds; this added to  $h(m+q)$ , which is 13.59, gives 13.86, leaving 0.46 for the effect of friction.

If the same resistances be computed on the supposition that the body moves in still water, in which case we have  $m=1$ , and  $q$  for a thin plate is 0.433, and if  $q$  be computed for the lengths of the other two bodies by the formula  $\frac{1}{q} = L 1.42 + \frac{l}{\sqrt{r}}$ , we shall get for

the resistances 14.94; 12.22; and 11.49.

Hence M. Buat concludes, that the resistances in these two states are nearly in the ratio of 13 to 10. This, he thinks, will account for the difference observed in the experiments of different authors.

M. Buat next endeavours to ascertain the quantity of water which is made to adhere in some degree to a

body which is carried along thro' still water, or which remains nearly stagnant in the midst of a stream. He takes the sum of the motions in the direction of the stream, viz. the sum of the actual motions of all those particles which have lost part of their motion, and he divides this sum by the general velocity of the stream. The quotient is equivalent to a certain quantity of water perfectly stagnant round the body. Without being able to determine this with precision, he observes, that it augments as the resistance diminishes; for in the case of a longer body, the filaments are observed to converge to a greater distance behind the body. The stagnant mass a-head of the body is more constant; for the deflection and resistance at the prow are observed not to be affected by the length of the body. M. Buat, by a very nice analysis of many circumstances, comes to this conclusion, that the whole quantity of fluid, which in this manner accompanies the solid body, remains the same whatever is the velocity. He might have deduced it at once, from the consideration that the curves described by the filaments are the same in all velocities.

He then relates a number of experiments made to ascertain the absolute quantity thus made to accompany the body. These were made by causing pendulums to oscillate in fluids. Newton had determined the resistances to such oscillation by the diminution of the arches of vibration. M. Buat determines the quantity of dragged fluid by the increase of their duration; for this stagnation or dragging is in fact adding a quantity of matter to be moved, without any addition to the moving force. It was ingeniously observed by Newton, that the time of oscillation was not sensibly affected by the resistance of the fluid: a compensation, almost complete, being made by the diminution of the arches of vibration; and experiment confirmed this. If, therefore, a great augmentation of the time of vibration be observed, it must be ascribed to the additional quantity of matter which is thus dragged into motion, and it may be employed for its measurement. Thus let  $a$  be the length of a pendulum swinging seconds in vacuo, and  $l$  the length of a second's pendulum swinging in a fluid. Let  $p$  be the weight of the body in the fluid, and  $P$  the weight of the fluid displaced by it;  $P+p$  will express its weight in vacuo, and  $\frac{P+p}{p}$  will be the ratio

of these weights. We shall therefore have  $\frac{P+p}{p} =$

$$\frac{a}{l} \text{ and } l = \frac{ap}{P+p}$$

Let  $nP$  express the sum of the fluid displaced, and the fluid dragged along,  $n$  being a number greater than unity, to be determined by experiment. The mass in motion is no longer  $P+p$ , but  $P+nP$ , while its weight in the fluid is still  $p$ . Therefore we must have

$$l = \frac{ap}{nP+p} = \frac{a}{n + \frac{p}{P}}, \text{ and } n = \frac{1}{\frac{P}{p} + 1} \left( \frac{a}{l} - 1 \right)$$

A prodigious number of experiments made by M. Buat on spheres vibrating in water gave values of  $n$ , which were very constant, namely, from 1.5 to 1.7; and by considering the circumstances which accompanied the vibrations of  $n$  (which he found to arise chiefly from the curvature of the path described by the ball)

87  
M. Buat's  
calculation  
of resistance,

88  
and of the  
quantity of  
water adhering to a  
body moving  
in still  
water, &c.

Resistance. ball), he states the mean value of the number  $n$  at 1,583. So that a sphere in motion drags along with it about  $\frac{1}{6}$  of its own bulk of fluid with a velocity equal to its own.

He made similar experiments with prisms, pyramids, and other bodies, and found a complete confirmation of his assertion, that prisms of equal lengths and sections, though dissimilar, dragged equal quantities of fluid; that similar prisms and prisms not similar, but whose length was as the square root of their sections, dragged quantities proportional to their bulks.

He found a general value of  $n$  for prismatic bodies, which alone may be considered as a valuable truth; namely, that  $n = 0,705 \frac{V^2}{T} + 1,13$ .

From all these circumstances, we see an intimate connexion between the pressures, non-pressures, and the fluid dragged along with the body. Indeed this is immediately deducible from the first principles; for what M. Boust calls the *dragged fluid* is in fact a certain portion of the whole change of motion produced in the direction of the bodies motion.

It was found, that with respect to thin planes, spheres, and pyramidal bodies of equal bases, the resistances were inversely as the quantities of fluid dragged along.

The intelligent reader will readily observe, that these views of the Chevalier Boust are not so much discoveries of new principles as they are classifications of consequences, which may all be deduced from the general principles employed by D'Alembert and other mathematicians. But they greatly assist us in forming notions of different parts of the procedure of nature in the mutual action of fluids and solids on each other. This must be very acceptable in a subject which it is by no means probable that we shall be able to investigate with mathematical precision. We have given an account of these last observations, that we may omit nothing of consequence that has been written on the subject; and we take this opportunity of recommending the *Hydraulique* of M. Boust as a most ingenious work, containing more original, ingenious, and practically useful thoughts, than all the performances we have met with. His doctrine of the *principle of uniform motion of fluids in pipes and open canals*, will be of immense service to all engineers, and enable them to determine with sufficient precision the most important questions in their profession; questions which at present they are hardly able to guess at. See *RIVERS and WATER-WORKS*.

89  
Change of  
resistance  
produced  
by the void  
behind a  
body

The only circumstance which we have not noticed in detail, is the change of resistance produced by the void or tendency to a void, which obtains behind the body; and we omitted a particular discussion, merely because we could say nothing sufficiently precise on the subject. Persons not accustomed to the discussions in the physico-mathematical sciences, are apt to entertain doubts or false notions connected with this circumstance, which we shall attempt to remove; and with this we shall conclude this long and unsatisfactory dissertation.

90  
explained.

If a fluid were perfectly incompressible, and were contained in a vessel incapable of extension, it is impossible that any void could be formed behind the body; and in this case it is not very easy to see how motion could be performed in it. A sphere moved in such a medium could not advance the smallest distance, unless some particles of the fluid, in filling up the space left by it, moved with a velocity next to infinite. Some

degree of compressibility, however small, seems necessary. If this be insensible, it may be rigidly demonstrated, that an external force of compression will make no sensible change in the internal motions, or in the resistances. This indeed is not obvious, but is an immediate consequence of the *quadruplex* pressure of fluids. As much as the pressure is augmented by the external compressions on one side of a body, so much is it augmented on the other side; and the same must be said of every particle. Nothing more is necessary for securing the same motions by the same partial and internal forces; and this is fully verified by experiment. Water remains equally fluid under any compressions. In some of Sir Isaac Newton's experiments balls of four inches diameter were made so light as to preponderate in water only three grains. These balls descended in the same manner as they would have descended in a fluid where the resistance was equal in every part; yet, when they were near the bottom of a vessel nine feet deep, the compression round them was at least 2400 times the moving force; whereas, when near the top of the vessel, it was not above 30 or 60 times.

But in a fluid sensibly compressible, or which is not confined, a void may be left behind the body. Its motion may be so swift that the surrounding pressure may not suffice for filling up the deserted space; and, in this case, a statical pressure will be added to the resistance. This may be the case in a vessel or pond of water having an open surface exposed to the finite or limited pressure of the atmosphere. The question now is, whether the resistance will be increased by an increase of external pressure? Supposing a sphere moving near the surface of water, and another moving equally fast at four times the depth. If the motion be so swift that a void is formed in both cases, there is no doubt but that the sphere which moves at the greatest depth is most resisted by the pressure of the water. If there is no void in either case, then, because the quadruple depth would cause the water to flow in with only a double velocity, it would seem that the resistance would be greater; and indeed the water flowing in laterally with a double velocity produces a quadruple non-pressure.— But, on the other hand, the pressure at a small depth may be insufficient for preventing a void, while that below effectually prevents it; and this was observed in some experiments of Chevalier de Borda. The effect, therefore, of greater immersion, or of greater compression, in an elastic fluid, does not follow a precise ratio of the pressure, but depends partly on absolute quantities. It cannot, therefore, be stated by any very simple formula what increase or diminution of resistance will result from a greater depth; and it is chiefly on this account that experiments made with models of ships and mills are not conclusive with respect to the performance of a large machine of the same proportions, without corrections, sometimes pretty intricate. We assert, however, with great confidence, that this is of all methods the most exact, and infinitely more certain than any thing that can be deduced from the most elaborate calculation from theory. If the resistances at all depths be equal, the proportionality of the total resistance to the body is exact, and perfectly conformable to observation. It is only in great velocities where the depth has any material influence, and the influence is not near so considerable as we should, at first sight, suppose; for, in estimating the effect of immersion, which has a relation

**Resistance.** to the difference of pressure, we must always take in the pressure of the atmosphere; and thus the pressure at 33 feet deep is not 33 times the pressure at one foot deep, but only double, or twice as great. The atmospheric pressure is omitted only when the resisted plane is at the very surface. D'Ulloa, in his *Examen Maritime*, has introduced an equation expressing this relation; but, except with very limited conditions, it will mislead us prodigiously. To give a general notion of its foundation, let AB (fig. 23.) be the section of a plane moving through a fluid in the direction CD, with a known velocity. The fluid will be heaped up before it above its natural level CD, because the water will not be pushed before it like a solid body, but will be pushed aside. And it cannot acquire a lateral motion any other way than by an accumulation, which will diffuse itself in all directions by the law of undulatory motion. The water will also be left lower behind the plane, because time *must* elapse before the pressure of the water behind can make it fill the space. We may acquire some notion of the extent of both the accumulation and depression in this way. There is a certain

depth CF ( $= \frac{1}{2\phi}$ , where  $v$  is the velocity, and  $\phi$  the accelerating power of gravity) under the surface, such that water would flow through a hole at F with the velocity of the plane's motion. Draw a horizontal line FG. The water will certainly touch the plane in G, and we may suppose that it touches it no higher up. Therefore there will be a hollow, such as CGE. The elevation HE will be regulated by considerations nearly similar. ED must be equal to the velocity of the plane, and HE must be its productive height. Thus, if the velocity of the plane be one foot *per* second, HE and EG will be  $\frac{1}{6}$  of an inch. This is sufficient (though not exact) for giving us a notion of the thing. We see that from this must arise a pressure in the direction DC, viz. the pressure of the whole column HG.

Something of the same kind will happen although the plane AB be wholly immersed, and this even to some depth. We see such elevations in a swift running stream, where there are large stones at the bottom.—This occasions an excess of pressure in the direction opposite to the plane's motion; and we see that there must, in every case, be a relation between the velocity and this excess of pressure. This D'Ulloa expresses by an equation. But it is very exceptionable, not taking properly into the account the comparative facility with which the water can heap up and diffuse itself. It must always heap up till it acquires a sufficient head of water to produce a lateral and progressive diffusion sufficient for the purpose. It is evident, that a smaller elevation will suffice when the body is more immersed, because the check or impulse given by the body below is propagated, not vertically only, but in every direction; and therefore the elevation is not confined to that part of the surface which is immediately above the moving body, but extends so much farther laterally as the centre of agitation is deeper: Thus, the elevation necessary for the passage of the body is so much smaller; and it is the *height* only of this accumulation or wave which determines the backward pressure on the body. D'Ulloa's equation may happen to quadrate with two experiments at different depths, without being nearly just; for *any* two points may be in a curve, without exhibiting its

equation. Three points will do it with some approach to precision; but four, at least, are necessary for giving any notion of its nature. D'Ulloa has given only two experiments, which we mentioned in another place.

We may here observe, that it is this circumstance which immediately produces the great resistance to the motion of a body through a fluid in a narrow canal.—The fluid cannot pass the body, unless the area of the section be sufficiently extensive. A narrow canal prevents the extension sideways. The water must therefore heap up, till the section and velocity of diffusion are sufficiently enlarged, and thus a great backward pressure is produced. (See the second series of Experiments by the French Academicians; see also Franklin's *Essays*.) It is important; and will be considered in another place.

Thus have we attempted to give our readers some account of one of the most interesting problems in the whole of mechanical philosophy. We are sorry that so little advantage can be derived from the united efforts of the first mathematicians of Europe, and that there is so little hope of greatly improving our scientific knowledge of the subject. What we have delivered will, however, enable our readers to peruse the writings of those who have applied the theories to practical purposes. Such, for instance, are the treatises of John Bernoulli, of Bouguer, and of Euler, on the construction and working of ships, and the occasional dissertations of different authors on water-mills. In this last application the ordinary theory is not without its value, for the impulses are nearly perpendicular, in which case they do not materially deviate from the duplicate proportion of the sine of incidence. But even here this theory, applied as it commonly is, misleads us exceedingly. The impulse on one float may be accurately enough stated by it; but the authors have not been attentive to the motion of the water after it has made its impulse; and the impulse on the next float is stated the same as if the parallel filaments of water, which were not stopped by the preceding float, did impinge on the opposite part of the second, in the same manner, and with the same obliquity and energy, as if it were detached from the rest. But this does not in the least resemble the real process of nature.

Suppose the floats B, C, D, H (fig. 24.) of a wheel immersed in a stream whose surface moves in the direction AK, and that this surface meets the float B in E. The part BE alone is supposed to be impelled; whereas the water, checked by the float, heaps up on it to  $e$ .—Then drawing the horizontal line BE, the part CF of the next float is supposed to be all that is impelled by the parallel filaments of the stream; whereas the water bends round the lower edge of the float B by the surrounding pressure, and rises on the float  $e$  all the way to  $f$ . In like manner, the float D, instead of receiving an impulse on the very small portion DG, is impelled all the way from D to  $g$ , not much below the surface of the stream. The surfaces impelled at once, therefore, greatly exceed what this slovenly application of the theory supposes, and the whole impulse is much greater; but this is a fault in the application, and not in the theory. It will not be a very difficult thing to acquire a knowledge of the motion of the water which has passed the preceding float, which, though not accurate, will yet approximate considerably to the truth; and then

**Resolution** than the ordinary theory will furnish maxims of construction which will be very serviceable. This will be attempted in its proper place; and we shall endeavour, in our treatment of all the practical questions, to derive useful information from all that has been delivered on the present occasion.

**RESOLUTION** of IDEAS. See LOGIC, Part I. c. 3.

**RESOLUTION**, in music. To *resolve* a discord or dissonance, says Rousseau, is to carry it according to rule into a consonance in the subsequent chord. There is for that purpose a procedure prescribed, both for the fundamental bass of the dissonant chord, and for the part by which the dissonance is formed.

There is no possible manner of resolving a dissonance which is not derived from an operation of cadence: it is then by the kind of cadence which we wish to form, that the motion of the fundamental bass is determined, (see CADENCE). With respect to the part by which the dissonance is formed, it ought neither to continue in its place, nor to move by disjointed gradations; but to rise or descend diatonically, according to the nature of the dissonance. Theorists say, that major dissonances ought to rise, and minor to descend; which is not however without exception, since in particular chords of harmony, a seventh, although major, ought not to rise, but to descend, unless in that chord which is, very incorrectly, called *the chord of the seventh redundant*. It is better then to say, that the seventh and all its derivative dissonances ought to descend; and that the sixth superadded, and all its derivative dissonances, should rise. This is a rule truly general, and without any exception. It is the same case with the rule of resolving dissonances. There are some dissonances which cannot be prepared; but there is by no means one which ought not to be resolved.

With respect to the sensible note, improperly called a *major dissonance*, if it ought to ascend, this is less on account of the rule for resolving dissonances, than on account of that which prescribes a diatonic procedure, and prefers the shortest road; and in reality, there are cases, as that of the interrupted cadence, in which this sensible note does not ascend.

In chords by supposition, one single chord often produces two dissonances; as the seventh and ninth, the ninth and fourth, &c. Then these two dissonances ought to have been prepared, and both must likewise be resolved; it is because regard should be paid to every thing which is discordant, not only in the fundamental, but even in the continued bass.

**RESOLUTION**, in chemistry, the reduction of a mixed body into its component parts or first principles, as far as can be done by a proper analysis.

**RESOLUTION**, in medicine, the disappearing of any tumor without coming to suppuration or forming an abscess.

**RESOLVENTS**, in medicine, such as are proper for dissipating tumors, without allowing them to come to suppuration.

**RESONANCE**, **RESOUNDING**, in music, &c, a sound returned by the air enclosed in the bodies of stringed instruments, such as lutes, &c. or even in the bodies of wind-instruments, as flutes, &c.

**RESPIRATION**, the act of respiring or breathing the air. See ANATOMY, N° 118. BLOOD, N° 29. ME-

DICINE, N° 104. PHYSIOLOGY, Sect. I. and PUTREFACTION, *passim*.

**RESPIRATION** of Fibres. See ICHTHYOLOGY, N° 7, 8, 9.

**RESPITE**, in law, signifies a delay, forbearance, or prolongation of time, granted to any one for the payment of a debt or the like. See **REPRIEVE**.

**RESPONDENT**, in the schools, one who maintains a thesis in any art or science; who is thus called from his being to answer all the objections proposed by the opponent.

**RESPONDENTIA**. See **BOTTOMRY**.

**RESPONSE**, an answer or reply. A word chiefly used in speaking of the answers made by the people to the priest, in the litany, the psalms, &c.

**RESSORT**, a French word, sometimes used by English authors to signify the jurisdiction of a court, and particularly one from which there is no appeal.— Thus it is said, that the house of lords judge *en dernier ressort*, or in the last resort.

**REST**, the continuance of a body in the same place, or its continual application or contiguity to the same parts of the ambient or contiguous bodies; and therefore is opposed to motion. See the article **MOTION**.

**REST**, in poetry, is a short pause of the voice in reading, being the same with the caesura, which in Alexandrine verses, falls on the sixth syllable; but in verses of 10 or 11 syllables, on the fourth. See **POETRY**, Part III.

**REST-HARROW**, or **CAMMOCK**, the *Oenanthe Avenfis*. A decoction of this plant has been much recommended to horses labouring under a stoppage of urine. It is the pest of some corn-fields; but in its younger state, before the plant has acquired its thorns, it is a most acceptable food to sheep.

**RESTAURATION**, the act of re-establishing, setting a thing or person in its former good state.

**RESTIO**, in botany; a genus of the triandria order, belonging to the diccra class of plants. The male calyx is an ovate spike of membranaceous scales; the corolla is proper, hexapetalous, and persistent. The female calyx and corolla are as in the male; the germen is roundish, and sex-fulcated; there are three erect and persistent styles; the capsule is roundish, with six plaits, and is rostrated and trilocular; the seeds are oblong and cylindrical.

**RESTITUTION**, in a moral and legal sense, is restoring a person to his right, or returning something unjustly taken or detained from him.

**Restitution of Medals**, or *Restituted Medals*, is a term used by antiquaries for such medals as were struck by the emperors, to retrieve the memory of their predecessors.

Hence, in several medals, we find the letters **REST**. This practice was first begun by Claudius, by his striking afresh several medals of Augustus. Nero did the same; and Titus, after his father's example, struck restitutions of most of his predecessors. Gallienus struck a general restitution of all the preceding emperors on two medals; the one bearing an altar, the other an eagle, without the **REST**.

**RESTIVE**, or **RESTY**, in the mane a stubborn unruly, ill-broken horse, that stops, or runs back, instead of advancing forward.

**RESTORATION**,

**Respiration**  
↑  
**Respite**

Restoration  
||  
Resurrection.

**RESTORATION**, the same with *restoration*. See **RESTAURATION**.

In England, the return of King Charles II. in 1660, is, by way of eminence, called the *Restoration*; and the 29th of May is kept as an anniversary festival, in commemoration of that event, by which the regal and episcopal government was restored.

**RESTORATIVE**, in medicine, a remedy proper for restoring and retrieving the strength and vigour both of the body and animal spirits.

All under this class, says Quincy, are rather *nourimental* than medicinal; and are more administered to repair the wastes of the constitution, than to alter and rectify its disorders.

**RESTRICTION**, among logicians, is limiting a term, so as to make it signify less than it usually does.

**RESTRINGENT**, in medicine, the same with *astrigent*. See **ASTRINGENTS**.

**RESULT**, what is gathered from a conference, inquiry, meditation, or the like; or the conclusion and effect thereof.

**Definition.** **RESURRECTION**, in theology, is a rising again from the state of the dead; and is that event, the belief of which constitutes one of the principal articles in the Christian creed.

**Plan of the article.** In treating of this object of our faith, it has been usual to mention, first, the resurrection of our blessed Lord, with the character of the witnesses, and the authenticity of the gospel history by which it has been proved, and from which, as a consequence, ours is inferred. But as most of the arguments for his resurrection are contained in the gospels, and as merely to repeat them would afford, we hope, but little information to most of our readers, we mean here to take a view of the several grounds on which the belief of a future existence is supposed to be founded; to collect together some of the sentiments of authors and nations concerning the place where departed spirits reside; concerning the nature of their present state; concerning the kinds of their future destination; that we may afterwards see how far their notions differ and agree with what we consider as the doctrines of Scripture.

<sup>3</sup> The notion of a future state unknown to some obscure tribes. Of a future state, there have sometimes been found a few wandering and obscure tribes who seemed to entertain no notion at all; though it should be remarked, that some of these were likewise observed in so low a degree of savage barbarity as not to be acquainted with the use of the bow, the dart, or the sling, and as not knowing how to wield a club, or to throw a stone, as a weapon of defence \*.

\* See Robertson's *Hist. of America*.

<sup>4</sup> Has been almost universal.

<sup>5</sup> The origin of this notion derived by some from primeval revelation.

Wherever the human mind has been cultivated, or properly speaking, begun to be cultivated, the opinion has likewise generally prevailed that human existence is not confined to the present scene; nay, so very general has this notion been found among mankind, that many are puzzled how to account for what they suppose to be almost next to its universality.

To explain the phenomenon, some have imagined that it is a notion derived by tradition from primeval revelation. They suppose that the first parent of mankind, as a moral agent accountable for his conduct, was informed by his Maker of every thing which it was of importance for him to know; that he must have been acquainted with this doctrine of a future state in particular; and that he could hardly fail to communicate a

matter so interesting to his posterity. They suppose, too, that the history of the translation of Enoch must have made a great noise in the world, and that the remembrance of it must have been long retained and widely diffused; and they find in the book of Job plain intimations of a resurrection from the dead, which, from the manner in which they are introduced, they think that very ancient patriarch must have received through this channel.

It is not thought to be any objection to these suppositions, that the Most High, when delivering his laws from the top of Mount Sinai, did not enforce them by the awful sanctions of a future state. The intelligent reader of the Scriptures knows that the sanctions of a future state belong to a different and more universal dispensation than was that of Moses; that the primeval revelation related to that dispensation; and that the Jewish law, with its temporal sanctions, was introduced only to preserve the knowledge and worship of the true God among a people too gross in their conceptions to have been properly influenced by the view of future rewards and punishments, of such a nature as eye hath not seen, nor ear heard, neither hath it entered into the heart of man to conceive. He feels at the same time, everywhere scattered through the Old Testament, plain indications of the Mosaic economy, being no more than preparatory to the bringing in of a better hope; and he thinks it evident, that such Jews as understood any thing of the nature of that better hope, must have been convinced, that, however the *ceremonial rites* of their religion might be sufficiently guarded by temporal sanctions, the *fundamental principles* of all religion and virtue are supported by rewards and punishments to be dispensed in a state beyond the grave. See **PROPHECY** and **THEOLOGY**.

That the progenitors of the human race must have been inspired by their Creator with the knowledge of support of their immortality, and of every thing necessary to their everlasting welfare, cannot, we should think, be questioned by any one who believes that the world had a beginning, and that it is under the government of goodness and justice. The progress from sense to science is so slow, that however capable we may suppose the earliest inhabitants of this earth to have been of making philosophical discoveries, we cannot believe that the Father of mercies left his helpless creature to discover for himself his future existence. Death, when first presented to him, must have been a ghastly object; and had he been left without any hope of redemption from it, he would undoubtedly have sunk into listless despondency.

But a prospect of immortality is so pleasing to the human mind, that if it was communicated to the first man, it would of course be cherished by his posterity; and there is no difficulty in conceiving how it might be handed down by tradition to very remote ages, among such of his descendants as were not scattered over the face of the earth in small and savage tribes.— In the course of its progress, it would frequently be new-modelled by the ever active imagination; and at last many absurd and fantastic circumstances would doubtless be combined with the original truth, that death puts not an end to human existence.

But though we are firmly convinced that the first principles of useful knowledge, and among them the doctrine of a future state, were communicated to man

Resurrection.

<sup>6</sup> The usual objections to this opinion of no force.

by his Maker; and though this doctrine, in large and permanent societies, might certainly be conveyed more or less pure to late posterity through the channel of tradition—we are far from attributing so much to tradition as some writers are disposed to do, or thinking it the only source from which mankind could derive the belief of their existence beyond the grave. In small tribes of savages such a tradition could hardly be preserved; and yet some indistinct notions of a future state have been found among tribes who are said to have lost all traditional notions even of the being of a God.

8  
Others imagine the notion might be conjectured from natural phenomena;

9  
as from dreaming, &c.

Others, therefore, are inclined to believe that, independent of any traditions, mankind might be led by certain phenomena to form some conjectures of a future state. They observe, that although a few individuals perhaps may, yet it seldom happens that the whole individuals of any nation are exempted from dreaming. They observe, too, and this observation is founded on experience, that the images of the dead are from the remaining impressions of memory frequently summoned up in the fancy, and that it appears from all the languages of rude nations, who pay the greatest attention to their dreams, and who speak of seeing the dead in their visions, that these images (A) have always been taken by them for realities; nay, some of the learned, and the celebrated Baxter is of the number, are disposed to doubt whether these appearances be not something more than illusions of the brain: But whether they really be so or not, one thing is certain, that all nations in all countries, in the darkest ages and the most remote periods are accustomed to dream; and whether sleeping or waking, in the stillness of the night, in the gloom of solitude, in the fondness of friendship, in the ravings of love, the delirium of fever, and the anguish of remorse, to see and converse with the shades of the departed, and Lucianus† has remarked, that even the inferior animals are not exempted from such illusions of

tion; and it is on this general principle that necromancers and dreamers have in all ages established their trade, that the stories of goblins have at all times so very easily procured belief, and that

Resurrec-

The village matron, round the blazing hearth,  
Suspends the infant audience with her tales,  
Breathing astonishment! Of witching rhymes  
And evil spirits; of the deathbed call  
Of him who sobb'd the widow and devour'd  
The orphan's portion; of unquiet souls  
Ris'n from the grave to ease the heavy guilt  
Of deeds in life conceal'd; of shapes that walk  
At dead of night, and clank their chains, and wave  
The torch of hell around the murderer's head.

AIKENSIDE.

Mankind in general would willingly dispense with these troublesome visits of the dead. To prevent the return of the *numbi* or the ghost, some nations of Africa, use many superstitious rites\*; and Kolben tells us, that the frightened Hottentots leave in the hut where a person has died all the utensils and furniture, lest the angry ghost, incensed at their avarice, should haunt them in their dreams, and infect them in the night. Divines and moralists have laboured to show that these are merely imaginary terrors: but God and nature seem to have determined that they shall produce the same effects upon certain minds as if they were real; and that while there is any sensibility in the heart, while there is any remembrance of the past, and any conjuring power in the fancy; the ignorant, the benighted, the timid, shall often meet with the goblins of darkness, the spectres of the tomb, the apparitions that hover round the grave, and the forms of the dead in the midnight dream. See SPECTRE.

From these phenomena, which have been so common in all countries and in all ages, what would mankind naturally infer? Would they not infer, that there is something in the nature of man that survives death, and that there is a future state of existence beyond the grave? Are not still many specimens of this reasoning preserved in the ancient poets? and is it not thus that Achilles† reasons after imagining that he saw the ghost of his friend Patroclus?

10  
Probable  
inferences  
from  
dreams, &c.

'Tis true, 'tis certain, man, though dead, retains  
Part of himself; the immortal mind remains;  
The form subsists without the body's aid,  
Ærial semblance, and an empty shade.  
This might my friend, so late in battle lost,  
Stood at my side a pensive plaintive ghost;  
Ev'n now familiar as in life he came,  
Alas! how different, yet how like the same. POPE.

† Hom. Iliad,  
Lib. XXIII.  
l. 103.

Lucianus||, a studious observer of nature, though so friendly to the soul's immortality, acknowledges frankly that these phantoms often terrify the mind, haunt us in our sleep, and meet us while awake. He confesses, too, that by such appearances mankind have been led

Lib. III.

These powers of fancy extend wide over animal crea-

(A) These images were called by the Greeks *Ειδωλα Ονειροειρη*; and among the Romans they had various names, as *umbræ*, *lucuræ*, *manes*, *larvæ*, and were sometimes called *occursacula noctium*, *hustorum formidamina*, *sepulchrorum terriculamenta*, *anima errantes*, which are all comprehended under the species *mortuorum*.

Resurrection. to believe the future existence of the soul ; but, aware of the consequences,

— Ne forte animas Acheronte reamur  
Effugere, aut umbras inter vivos volitare,

he endeavours to explain these curious phenomena on some of the odd and fantastic principles of the Epicureans. In doing this, however, he pretends not to deny that these images appear to be real; but, tendentially acknowledges that

-They strike and strike

The airy soul, as when we are awake,  
With stroke so lively, that we think we view  
The absent dead, and think the images true.

We here see how the belief of the soul's immortality came to be general among mankind. But for this information we are much more indebted to the poets, who have given us faithful transcripts of nature, than to the philosophers who have wished to entertain us with their own theories, or to those laborious men of erudition, who have dreaded as much to examine the source of an ancient report as the friends of Ulysses to approach the coast of Cimmerian darkness. With them tradition is the ultimate boundary of research; and as gorgons, chimeras, and hydras, have come down to us by tradition; so they, with great sagacity, suspect, that tradition must likewise be at the bottom of the soul's immortality, and occasion the visions and phantoms of the dead.

To tradition we have allowed all that it can justly claim : but we cannot allow it to be the only source of this opinion : and we have felt the highest indignation upon hearing men of learning and genius affirm, from a false zeal for the honour of revelation, that mankind, without this instruction, could never have acquired the art of building huts to screen them from the cold, or have learned the method of propagating their species ! The reader must not here suppose that we allude to Polydore Virgil (a). We have in our eye persons now alive, with whom we have conversed on the subject, and who (terrified at the length to which some philosophers have carried the doctrine of instincts, and others the reasoning powers of the mind) have contended, with the utmost earnestness, that we know nothing—not even the functions of our animal nature—but by tradition or written revelation.

<sup>12</sup>  
 opinions of Having now seen the source of the opinion concern-  
 ing the future existence of the soul, and pointed out  
 the natural phenomena by which mankind were led to  
 embrace it, we come next to review the arguments by  
 which the philoposophers attempted to confirm it.

Pythagoras believed, with the rest of his country, that annihilation was never the end, and that nonentity was never the beginning, of any thing that is. His general doctrine upon this subject was shortly expressed in very few words, *Omnia mutantur, nihil interit*. He afterwards learned from Egyptian priests that the soul migrates into new bodies; and being, it seems, a person of a most extraordinary and astonishing memory, he found there was some truth in the story: for after misting, he began to remember that he was Euphorbus, the son of Panthrus, that was slain by Menelaus in the Trojan war; and upon a jaunt to Peloponnesus, recollected the shield which he had worn at the time of the siege, in one of the temples of Juno at Argos! That none might question the truth of his assertion, his followers presently arranged his life by the famous argument, the *transmigration* of Egyptian origin.

101. **A** Pythagoras taught that human souls are frequently thrust into brute shapes, and, as some imagined, by way of punishment. It occurred to Plato, that all bodies even the human are a sort of prison; and that, in consequence of this confinement, the soul was subjected to the rage of desire, appetite, and passion, and to all the wretched sufferings of life. To escape from this misery, he supposed that desire and passion belong to a soul that is purely animal residing in the body. But he was perplexed with another difficulty; for as he thought highly of the goodness of Deity, he could not imagine how he should ascribe to an inferior creature. He supposed, therefore, that even in this state the present body the soul had existed in one of them which it still retains; but that even in this state, as it had felt something of impure desire, and was prone to indulge the vicious appetite, and contract the stains of pollution, for which it was confined in the present body as a house of correction to be purged and improve its morals.

To prove this ideal pre-existence of the idea of the idea and mode  
availed himself of an opinion that was not only of proving it.  
time, that coincided with the idea of the idea and mode  
and that was partly founded on a idea of idea and mode  
obligation. His thought that idea of the idea and mode  
are co-eternal (the idea of the idea and mode) and that  
orders of idea of the idea and mode are idea of the idea and mode  
brute as idea of the idea and mode of the idea and mode,  
or, last of all, idea of the idea and mode of the idea and mode,  
or emanations of idea of the idea and mode, and that all these faculties  
are more or less idea of the idea and mode and confined, according to  
those organs and systems with which they are connected.  
Knows not (the idea of the idea and mode) his doctrines).

Know first, that heav'n and earth's compacted frame,  
 And all the wat'ry world, and the starry flame,  
 And all the rad'ant lights, one common soul  
 And all the powers, and feeds, and animates the whole.

**This**

(b) This writer allots part of a chapter to show, "*Qui primum instituerit artem meretriciam*," as being in his opinion, a traditionary practice. See Lib. III. cap. 17. *De Rerum Inventoribus*.

(c) The Deity was conceived by the ancients sometimes as a solid, when inferior souls were called *πτοσπασμῆ*, i. e. fragments or parts broken off from him; and sometimes as a fluid, when they were considered as *ἀπορροῖ*, or emanations: but from none of these hypotheses did they reason consequentially. Their *πτοσπασμῆ* were often after death re-united to the Deity; and their *ἀπορροῖ* often remained separate and distinct for a long while, without flowing back as they ought to have done, and mingling with the great ocean of spirit.

Refursec-  
tion.

This active mind, infus'd through all the space,  
Unites and mingles with the mighty mass:  
Hence men and beasts the breath of life obtain,  
And birds of air, and monsters of the main;  
The ethereal vigour is in all the same,  
And every soul is fill'd with equal flame;  
As much as earthy limbs, and gross alloy  
Of mortal members, subject to decay,  
Blunt not the beams of heav'n and edge of day (D)

DAVID.

Besides this hypothesis, that in some measure was common to others, Plato had an argument peculiarly his own. Happening to peep into the region of metaphysics, he was somewhat surpris'd on observing the ideas which we derive from reflection and contemplation, and supposing that they could not have entered by the senses, he naturally, though not very judiciously, concluded, that we must have received them in some state of prior existence.

As, according to him, the soul was eternal, as well as the matter which composed the body, and as their union was only temporary and accidental, he might have been inclin'd that the death of the soul was not to be the consequence of their separation. But, some have oppos'd; and he was not. He had recourse to a new hypothesis. As the soul, he said, was an active principle, and a self-moving, it did not depend for its continuance on any other, and therefore would always continue to exist, though the body were reduced to the general mass out of which it was formed. See METAPHYSICS, Book III. Chap. IV.

Plato had borrowed any of his doctrines from the ancient Egyptians, we pretend not to say. We only observe a striking similarity, in some respects, between his and theirs. In Plato's philosophy, the sun, moon, and stars were supposed beings, and a sort of divinities that originally had sprung from the great fountain of light and truth, and our earthly bodies a sort of dun-geons, in which our miserable souls are benighted and debas'd by gross appetites, and passions. In the Egyptian philosophy, the Supreme Being was call'd Oromasdes, or the Father of Light, and was light itself, and represented by a bull, a subordinate divinity, and the same with the sun, was the deity of very great power was Arimanez, the god of darkness, who pervaded over matter, and was the origin of all evil (see Hermetism).

VOL. XVI. Part I.

The ancient Gnostics, who derived their tenets from this source, believed, with Pythagoras and Plato, in a great number of subordinate genii; and said, that Demurgus, the god of matter and the soul or spirit of this world, had contriv'd the bodies of men and brutes; and in the former particularly, as in so many prisons, had confin'd a number of celestial spirits, that by exposing them to the low desires of appetite and passion, he might seduce them from their allegiance to the God of light, and render them more submissive to himself. From these prisons the Supreme Being was continually making attempts to rescue them; and in the mean time was frequently sending divine messengers to enlighten and instruct them, and to render them capable of ascending to the regions of light and happiness, to which they had belonged (E).

The Stoics attempted to simplify this system, which appears evidently to have pervaded Egypt and the east, and which would seem to be no more than variously modified by Orpheus, Pythagoras, Plato and others of the more northerly and western nations. None of them allowed a creation out of nothing; and the shaping and modelling of matter into forms was variously explained, according as they happened to be most addicted to superstition, to morals, or to physics. Some ascribed these operations to ancient Time, Chaos, and Darkness, and explained the future changes of nature by the genealogies of these deities; some observing attraction and repulsion, or at least a sort of agreement and discordance among bodies, were inclin'd to ascribe them to Friendship and Hatred, or Love and Antipathy; some observing, that while one body rose another descended, made Levity and Gravity primary agents; and some taking notice that living bodies sprung from corruption, were dispos'd to confer the same powers on Moisture and Heat.

The physical hypotheses were what had most charms Of the for the Stoics. From their system immaterial beings were openly excluded; all things were regulated by physical laws or inexorable fate; and all things originated in the *Το Ε*, or the *First One*, which was probably suggested by the *Monas* of Pythagoras. This *Το Ε* appears to have been a *materia prima* devoid of all the qualities of body. In their language it was an *Αεϋρον* or *first principle*, not subject to change. When it was invested with the properties of body, it then became

R

a

(D) The general doctrine, as it is set forth in the verses of Virgil, is the same with that not only of Pythagoras, but of the Stoics.

(E) Plato made the stars the native regions of inferior souls; and when these were thoroughly purified below, returned them home again: and therefore, says Virgil, according to his doctrine,

That bees have portions of ethereal thought,  
Endu'd with particles of heav'nly fire;  
For God the whole created mass inspires:  
Thro' heav'n, and earth, and ocean's depth, he throws,  
His influence round, and kindles as he goes.  
Hence flocks, and herds, and men, and beasts, and fowls,  
With breath are quicken'd, and attract their souls:  
Hence take the forms his prescience did ordain,  
And into him at length resolve again.  
No room is left for death, they mount the sky,  
AND TO THEIR OWN CONGENIAL PLANETS FLY.

Dryden.

Resurrec-  
tion

a *resurrexer* of an *element*; and then, so far as respected its qualities, especially its forms, it was subject to changes almost perpetual. The gods themselves and the souls of men were in this system only modifications of matter (r). Man was composed of their four elements, Fire, Air, Water, and Earth; and upon dissolution, every part returned to the element from which it had come, as the water of a vessel swimming in the sea unites with the ocean when the vessel is broken. This system, it is plain, cannot possibly admit of any separate consciousness of existence (s). The foundation of all the systems of Democritus and Epicurus, and of those who undertook to explain things upon physical principles (u). The chief merit of the Epicurean system appears to be this: Afford us a theory which would seem from the whimsical and the absurd reasoning of Lucretius, that they had a tendency to lead mankind from extravagant hypotheses to something that was similar to observation.

What Aristotle thought of the separate existence of the soul after death is not very certain. The soul he calls an *Enlaxia*; and if the reader can divine the meaning of the word, he perhaps can divine the meaning of the *Stagyrite*, and will then be a better diviner than we. At other times he says, that the soul is something divine; that it resembles the element of the stars; that it is something of a fiery nature; that it is the vicegerent of God in the body; and that the acuteness of the senses, the powers of the intellect, with the various kinds of appetites and passions, depend entirely on the qualities of the blood (1).

Another opinion of very old date was that of the late ingenious Mr Hunter. According to him, the living principle resides in the blood. This opinion, which is mentioned by Moses, was adopted by Critias and others of the ancients. Harvey likewise embraced it. But Mr Hunter, who always wished to be thought an original, inclines to stand at the head of the opinion, and supports it by experiments similar to those of the famed Taliacotius in mending noses. Should any of our readers wish to extract the soul's immortality from such an opinion, we must refer them to the many resources of ingenuity, sophistry, and logic.

Among the Jews, the belief of a future and separate existence of a long time was deemed no essential article of their creed. Some thought that the soul was a spark

in the moving of the heart; some imagined that it was the breath, and that upon the dissolution of the body it naturally vanished into soft air. The Sadducees denied the existence of either angel or spirit. Many believed the doctrine of ghosts, and were accustomed to invoke them at the grave. It is hence that we hear the prophets complaining that they were seeking from the living God unto dead men. Some imagined that there was a pre-existence of souls; and, in the case of a blind man, asked our Saviour, whether the man or his parents had sinned that he was born blind? Others inclined to a revolution of soul and body, and thought that our Saviour was either Elias or one of the old prophets returned; and a great many new-modelled notions of the soul's immortality according to certain passages in Scripture. The inspired mother of Simeon said, "The Lord killeth and maketh alive: he bringeth down to the grave, and bringeth up." Hailsh had exclaimed, "Thy dead shall live; together with my dead body shall they arise: Awake, and sing, ye that dwell in the dust: for thy dew is as the dew of herbs, and the earth shall cast out the dead." Daniel had declared, that many of them that sleep in the dust of the earth shall awake to everlasting life, and shall not have their reward of contempt. In the vision of the valley of dry bones, Ezekiel had seen that the bones of the Lord's people should be gathered together, and the sinews and the flesh come upon them, and the hair covered them above, and the spirit came into the bodies, and they lived and stood upon their feet. A similar passage of Job led them to suppose, that the same instant and future period, a particular resurrection, called the *Just* or the *Later day*, was appointed by God for the general resurrection of all the dead, and for raising them from their graves: "I know (says Job) my Redeemer liveth, and that he shall stand at the latter day upon the earth: and though after my skin worms shall destroy this tabernacle, in my flesh shall I see God."

Whether these passages were fulfilled, or not, is a matter of great importance to their true and original meaning. It is our business to enquire, whether the passages are to be understood, that the resurrection is a general resurrection, or a particular resurrection. Martin, speaking of the resurrection, says to our Lord, "I know that the dead shall rise in the resurrection at the last day." The resurrection appears

Resurrec-

and others.20  
Of the  
Jews.

(r) The *Axy* of the Stoics appears to be the same as the *Enlaxia* of Aristotle. (s) Yet without regarding the inconsistency of the Stoics, believed, that the soul continued separate long after death; though all in general seemed to be in favour of rewards and punishments.

(u) In his *Physical Cosmogony*, Plato differed from the Stoics; but he had another sort of cosmogony; in which all things appear to have sprung from the *One*, or the *Monad*, which is wholly composed of, metaphysical entities, as ideas of forms, numbers, and mathematical figures. These kinds of notions were common both to him and Pythagoras; and were originally borrowed from Egypt, where calculation and geometry were half deified. See PLATONISM.

(1) The immortal Harvey has collected these different opinions of the Stagyrists in Exercit. 52. *De Generatione Animalium*.

(k) At present some are for allowing only those of their own nation to share in the benefits of this resurrection; and some are not even for allowing them, except they be men of piety and virtue. To render this resurrection probable, the rabbins say, with some of the Mahometans, that there is a certain bone in the body which resists putrefaction, and serves as a seed for the next body\*. What that bone is, is of no great moment. \* See Phas any bone, we believe, in the skeleton will answer the purpose equally well. With respect to the manner of rising, this resurrection, the learned Hody has quoted several opinions of the Jews, and, among others, that of the Chal-

dec

Resurrec-  
tion.

to have been a general opinion among the Pharisees; for although it was a notion of the sect of the Sadducees that there was no resurrection, neither angel nor spirit, yet the Pharisees, we are told, confessed both: And this assertion is plainly confirmed by St Paul himself when his countrymen accused him before Felix, "I confess unto thee (says this eminent apostle), that after the way which they call hereby so worship I the God of my fathers, believing all things which are written in the law and in the prophets, and having hope toward God, which they themselves also allow, that there shall be a resurrection of the dead, both of the just and unjust."

21  
Of the  
Christians.

This resurrection of the dead to judgment, though not perhaps in the same sense in which the Jews conceived it, is now generally and almost universally (u) maintained by Christians (w). Yet the Christians differ considerably with respect to the nature of the human soul. Some imagine, that this spirit is naturally mortal, and that it is propagated along with the body from the loins of the parents. In support of this opinion, it has been observed, that a great number of insects and plants transfer their lives to their posterity; and die soon after the act of propagation; that after this act the vital principle is in the most vigorous of plants and animals always found to be much exhausted; and that Tertullian a father of the church, in attempting some experiments of the mind, became subject to a momentary blindness, and felt a portion of his soul go out of him (x).

Others imagine, that immortality was only conditionally forfeited by man; that Adam forfeited this immortality by his disobedience; and that Christ has restored it to the human race again by his sufferings and death: so that mankind are here all died, so in Christ, they are all made alive; and that now the sting of death is taken away, and the victory over our souls from the grave.

Others again represented the human soul as naturally immortal, and that death and the grave at death is only a sleep; and that the soul is only a figure; and that the resurrection of this figure, which means

fin, has our Lord saved us. In this sense Adam died Resurrec-  
tion on the very day in which he had sinned; or he died literally in 1000 years, which with the Lord are as one day. To these arguments their opponents reply, What then is the victory over death and the grave? You must still have recourse to a new figure, and betake yourselves to the second death; though, after all, where is your grave? To this it is answered, That the soul of itself is naturally immortal, and that it depends not either for its existence or the exercise of its faculties upon the body, than the properties of matter, as figure, magnitude, and motion, can produce nothing that is like to perception, memory, and consciousness. This is true, reject their opponents; but besides these few properties of matter, which are only the objects of that philosophy which has lately and properly been termed *mechanical*, the chemical philosophy has discovered other properties of matter; has found that matter is of various kinds; that it very often does not act mechanically; that it acquires many new properties by combination; and that no man, still farther experiment and observation, should venture to assert how far the soul is or is not dependent on its present organized system. The others, proceeding on their hypothesis, maintain that the soul, as being immaterial, is not divisible; and though the body of a frog may live without the head for a whole day; though the body of a tortoise may live without the head for a whole month; though a human limb may for some minutes after amputation continue to perform a vital motion, independent of a brain, a stomach, or a heart; and though the parts of a plant, a polype, or a worm, may survive their separation and become living wholes\*, yet the soul, they observe, is not to be compared with the vital principles of plants and animals, nor ought to be divided on reasons so slender as those of analogy. Even granting, they say, that the soul were not naturally immortal of itself; yet the justice of God, which is not remarkable for its equal distribution of rewards and punishments in the present world, is bound to make some amends in the next. And to this again their opponents answer, as to the equal distribution of justice in a future world, of that we are assured on much bet-

R 2

ter

the paraphrase of the Canticles, according to the prophet Solomon had said, "When the dead shall revive, it shall come to pass that the Mount of Olives shall be left, and all the dead of Israel shall come out from thence; and the just too that shall be raising shall come forth by the way of the caverns under the earth, and shall come forth out of the Mount of Olives." He has likewise quoted Saunderson's Voyage to the Holy Land, in which, we are told that many of the Jews by the prophet Isaiah, are to rise up in the valley of Jehoshaphat; and that in the *rolling* or *devolution* of the earth, all the dead must scrape their way thither with their nails.

(L) The sect of the Quakers explain it differently.  
(M) The last quoted author (*Resurrection of the same Body, asserted from the traditions of the Heathens, Hds, the ancient Jews, and the primitive Church*) has endeavored to show that this doctrine, in the same sense as we understand it, has been asserted by the ancient Magi; and by the present heathen Gauris of Persia, the relics of the ancient Magi; by some of the ancient Arabians; by some of the Bauans of India; by the present inhabitants of the island of Ceylon, of Java, of Pegu, of Transtiana; by some amongst the Chinese; by the Arderians in Guinea; and by the ancient Prussians. The proofs which he brings, it must be confessed, are not however always very satisfactory. It appears, even from his own account, that some of these had derived their notions from certain Christians, Mahometans, or Jews. But the reader may judge of the great accuracy of his ideas from his bringing old Pythagoras and the Stoics, and even Democritus and Epicurus, in support of the same or a similar opinion.

(N) In illo ipso voluptatis ultime actu quo generis virus expellitur, nome aliquid de anima quoque sentimus exire, atque adeo marcellinus ei devigilemus cum luce detrimento.

Religious.

yet grounds than any of your's: our Lord has declared it in express terms; and whether the soul be immortal or not, we can easily believe what he said is true; as we know him whom we have trusted.

These, with Plato, suppose that the soul is here as in prison; though how or at what time it should first have come into this dungeon they have not determined. They have only agreed, that upon its enlargement all its faculties are to receive an increase of power; and "having already equipped it with consciousness, activity, and perception, in order to put it into so complete a capacity, that it may not be misery in a separate state," they have not required them to admit the least sensation of resurrection; which accordingly is said to have been a part of Baxter's creed (o).

A third opinion, which extends likewise to every species of plant and animal, is, that all souls were created at once with bodies of ether; that these bodies, occupying only a very small space, were packed up in their first progenitors, and there left to be afterwards evolved and clothed with matter of a grosser kind by acts of generation and consequent nutrition. For the proof of this theory we are referred to the small animals seen through the microscope, and likewise to those which are supposed to escape even microscopic observation; but, above all, to the eggs of insects, which, though scarcely perceptible, yet contain in embryo a future caterpillar and all its coats, and within these a future butterfly with its legs and wings. These philosophers can perhaps account for the general taint of original sin in some other way than has hitherto been done. We have only to add, that on their scheme the resurrection is not a matter that seems to be indifferent.

The next thing that falls to be considered is the place of the dead. From a natural enough association of ideas, an opinion had very early prevailed, that the spirit continued near to the body; and the offerings therefore intended for the dead were by most nations presented at the grave; and that on which the departed spirit is supposed to rest is always placed near the grave in China.

From the dreams of the night and the natural tendency of the fancy to work and to summon up spectres when the world around us is involved in darkness, it has also been imagined, that these spirits delight in the night and shadow of death (p); or have been prohibited from enjoying the exhilarating beams of the sun; and hence we are told,

That in the dismal regions of the dead

Th' infernal king once rais'd his horrid throne

Leap'd from his throne, left Neptune's realm

His dark dominions open to the day

And pour in light.

The nations, therefore, who have practiced general sepulture, and who have had no species of writing, the same picture is on

place it in the west (q), where the night begins and the day ends. That part of the world which, in the division of his father's dominions, fell to Pluto the infernal god; and where, according to Lactantius, Saturn holds the empire of darkness, the Friendly Islanders have placed to the westward of a certain island which they call *Tajee*; some tribes of American Indians, in a country beyond the western mountains; and Homer, somewhere to the westward of Greece at the boundaries of the ocean,

Where in a lonely land and gloomy cells

The dusky nation of Cimmeria dwells;

The sun ne'er views th' uncomfortable seats

Whom radiant he advances nor retreats.

Whom sleep, whom endless night invades,

Clouds the dull air, and wraps them round in shades.

Another opinion entertained by the Greeks and some

other nations was, that the place of departed spirits is

under the earth. This opinion is frequently mentioned

in Homer, in Virgil, and alluded to by the Jewish pro-

phets. As for the prophets, we know the circumstance

from which they borrowed it: it was borrowed from

those subterraneous vaults where their kings were bur-

ied; and which have been described by modern travel-

lers. In the sides of these caverns there is ranged a

great number of cells; and in these cells the mighty lay

in a sort of state, with their weapons of war and their

swords at their heads. To these kinds of Egyptian co-

meteries Ezekiel alludes, when he says, "that they shall

not lie with the mighty that are fallen of the ancient

cificed, who are gone down to hell with their weapons of

war, and they have laid their swords under their heads.

And Isaiah, when thus speaking of the palace of Ba-

bylon. "Thou shalt be brought down to hell, to the

sides of the pit. Hell from beneath shall move to

thee, to meet thee at thy coming: it shall arise and be

dead for thee, even all the chief ones of the earth: it

hath raised up from their thrones the kings of the

nations. All the kings of the nations shall be of

them, lie in glory; every one in his own house: they had

many of the ancient kings of the world, and they had

only, that the dead lie not in a common receptacle, or in

certain hidden and secret places, but in the air.

Orpheus, Origen, and some others of the fathers, in the air.

with the ancient Egyptians, and others, and the learn-

ed of the world, imagined that the souls of the dead

were in the air, and that they were in the air, and

that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

and that they were in the air, and that they were in the air,

35  
Virgil's  
purgatory.

years, if the body was not honoured with funeral rites. Among the Scandinavians, a natural death was attended with infamy, while a violent death, particularly in battle, gave a title to sit in the halls of Odin, and to quaff beer from the skulls of enemies. Among the Tlascalans, it was only the great that were permitted to animate birds and the nobler quadrupeds; the lower ranks were transformed into warts, into paltry beetles, and such mean animals. Among the Mexicans, those who were drowned, who died of wounds, or such like diseases, were supposed to be the children that had been sacrificed to the gods; and in a cool and delightful place they were indulged in delicious repasts, and were permitted to those who died of other diseases, were the centre or centre of the earth, and were under the dominion of the gods of darkness." "The soldiers who died in battle, or in captivity among their enemies, and the women who died in labour, went to the house of the sun, who was considered as the prince of glory. In his mansions they led a life of endless delight. Every day the soldiers, on the first appearance of his rays, hailed his birth with rejoicings and with dasciags, and the music of instruments and voices. At his meridian they met with the women, and in like festivity accompanied him to his setting. After four years of this glorious life, they went to animate clouds, and birds of beautiful feathers and of sweet song; but always at liberty to rise again, if they pleased, to heaven, or descend to the earth, to warble their songs, and to suck flowers \*."

These sentiments of a future state, conceived in a savage and a rude period, could not long prevail among an enlightened and civilized people. When the times of rapine and violence therefore began to cease; when societies regulated by certain laws began to be established; when martial prowess was less requisite, and the qualities of the heart had begun to give an importance to the character, the future state was also modelled on a different plan. In the *Aeneid* of Virgil, an author of a highly cultivated mind, and of polished manners, it becomes a place of the most impartial and unerring justice; every one now receives a sentence suited to the actions of his past life, and a god is made to preside in judgment;

Who hears and judges each committed crime,  
Inquires into the manner, place, and time;  
The conscious wretch must all his acts reveal,  
Loth to confess, unable to conceal,  
From the first moment of his vital breath,  
To the last hour of unrepenting death.

The spirits of the dead no longer wander as in the less enlightened period of Homer; they are dismissed to a place of torment, or are sent to regions of bliss: indifferent characters are confined to a limbus; and those who are too wicked for hell, but too much polluted with the stains of vice to enter heaven without preparation, are for some time detained in a purgatory.

For there are various penances enjoined,  
And some are hung to bleach upon the wind;  
Some plung'd in waters, others purg'd in fires,  
Till all the dregs are drain'd, and rust exposes;  
Till nothing left of their habitual stains,  
But the pure ether of the soul remains.

When thus purified, they become fitted to receive the rewards of their past virtues, and now enter into those regions of happiness and joy.

36  
His hea-  
ven.

With ether vested, and a purple sky,  
The blissful seats of happy souls below,  
Stars of their own, and their own suns they know;  
Where patriots live, who, for their country's good,  
In fighting fields were prodigal of blood.  
Priests of unblemish'd lives here make abode,  
And poets worthy their inspiring god;  
And searching wits, of more mechanic parts,  
Who grac'd their age with new-invented arts;  
Those who to worth their bounty did extend;  
And those who knew that bounty to commend.

These good men are engaged in various amusements, according to the taste and genius of each. Orpheus is still playing on his harp, and the warriors are still delighted with their weapons, their horses, and their arms. The place of torment is at some distance.

37  
His hell.

A gaping gulf, which to the centre lies,  
And twice as deep as earth is distant from the skies;  
From hence are heard the groans of wretched souls,  
Of sounding hammers, and of dragging chains;  
Here, those who brother's blood have shed, and  
Expel their parents, and usurp the throne;  
Defraud their clients, and to meet fold,  
Sit brooding on uncharitable plans,  
Who dare not give, and even to their kind,  
To their poor kindred, or a wandering stranger,  
Vast is the throng of these unhappy souls,  
Of lustful youths for too long time,  
Hosts of deserters, who their country's  
And basely broke their faith, and  
All these within the dragon's den,  
Despairing pardon, and expiating pain.

The souls of babes, of madmen, and of others, seem to be placed in a separate region, or a quarter distinct from the others. In a purgatory, or a place of torment, they are confined for some time, and then are sent to a place of bliss. Some have fancied a number of heavens, corresponding to some of their principal virtues, and have filled each of these heavens respectively with all the scenes of happiness and misery, which friendship and hatred, admiration, contempt, or enmity, could suggest. But having already observed the progress of the human mind in forming the grand and leading ideas of a future state, we mean not to descend to the modifications which may have occurred to particular nations, sects, or individuals.

The belief of Christians respecting futurity demands the state of the dead, as being founded on a different principle, namely, on express revelations from heaven. From many express declarations in Scripture, all Christians seem to be agreed, that there is a heaven appointed for the

39

in Scrip-  
ture.

Resurrec-  
tion.

our Lord foretels that the third day after his death he shall rise from the grave. Here no place was reserved for deception. The sect of the Pharisees and the chief priests are openly warned and put upon their guard; and, very fortunately for the cause of Christianity, this singular prediction was not heard with scorn, or indeed, if with scorn, it was only affected. We know from the sentiments expressed in the council, that our Lord was secretly dreaded by the rulers; that his miracles were far from being discredited; and that his predictions, in their private opinion, were not to be despised. The means accordingly which they employed to prevent him in the very appearance, the completion of his mission, were admirably calculated to remove the scruples of the most wary and sceptical inquirers, if they were only to search after truth. At the next morning, the palace, when the scheme of Caiaphas was put in execution, and when it was deemed expedient by the council that he should die, to save the nation from the jealousy of the Romans; as a proof of their steady loyalty to Rome he was apprehended, was tried as an enemy to her government, was at last condemned upon false evidence, and suspended on a cross until they were fully satisfied of his death. Even after his death, the spear of a soldier was thrust into his side; and the water that gushed out with the blood is a proof to those who are acquainted with the structure and economy of living bodies, that he must have been some time dead.

50  
and above  
all by his  
own resur-  
rection.

After he was taken down from the cross, a seal was put on the door of the sepulchre in which he was laid, as the best check against secret fraud; and a guard of soldiers was stationed around it, as the best security against open violence. In spite, however, of all these precautions, the prediction was accomplished; the angel of God, descending from heaven with a countenance like lightning, and with raiment white as snow; the watch shake, and become as dead men; the earth quakes; the stone is rolled from the mouth of the sepulchre; the angel sits on it, and our Lord comes forth.

It was in vain for the Jews to allege that his disciples came in the night, and stole him away, while the watch were asleep. One must smile at these puerile assertions. How came the disciples to know that the watch were asleep; or what excuse had the watch for sleeping, and incurring a punishment which they have to be capital in the Roman law? and how came they in the name of wonder, to be brought as an evidence for those transactions that happened at the time when they were asleep?

Whatever credit may be given by those who believe this ill-framed story, it is past dispute that it was among the Jewish rulers at the time that our Lord rose. Not long after our Saviour's resurrection, the rulers were called before the council, and the charges against their death for teaching in the name of Jesus, and the violence upon that occasion was so provoking, that the council that the threat would have been instantly put in execution, had not Gamaliel, a doctor of the law of high reputation, put them in mind of other impostors who had perished in their attempts to mislead the people; and concluded a very sensible speech, with these remarkable words: "And now, I say unto you, refrain from these men, and let them alone; for if this counsel, or this work, be of men, it will come to nought; but if it be

of God, ye cannot overthrow it, lest haply ye be found even to fight against God." This advice the council followed. But is it possible that Gamaliel could have given it, or the council paid the least regard to it, had the story of the disciples stealing the body been then credited? Surely some among them would have observed, that a work or counsel, founded on imposture and fraud, could not be supposed to be of God, and they would unquestionably have slain the apostles.

The story of stealing the body is indeed one of the most senseless fictions that ever was invented in support of a bad cause. Our Lord was on earth 40 days after he arose. He appeared frequently to his disciples. He ate and drank in their presence; and when some of them doubted, he bade them handle him and see that he was not a spectre, showed the mark of the spear in his side, and the prints of the nails in his feet and hands. Besides thus appearing to his disciples, he was seen by more than 500 brethren at one time; all of whom, as well as the apostles, must necessarily have known him previous to his rising, and could not therefore mistake that he was the person who was once dead, but was then alive. Yet for 40 days in general, who had not seen him previous to his death, and could not therefore identify his person after the resurrection? And yet many other persons that were known to him before his resurrection, did not identify him after it. They received him as a stranger, and he had to defend himself from them. That then they should be so ready to believe that he was the same person who was once dead, and who had been seen by more than 500 brethren at one time, and who had been seen by many other persons that were known to him before his resurrection, and who had not identified him after it, is a most unreasonable supposition. The story of stealing the body is a most senseless fiction, and the council would not have been so ready to believe it, had they not been so ready to believe that the person who was once dead, and who had been seen by more than 500 brethren at one time, and who had been seen by many other persons that were known to him before his resurrection, and who had not identified him after it, was the same person who was once dead, and who had been seen by more than 500 brethren at one time, and who had been seen by many other persons that were known to him before his resurrection, and who had not identified him after it.

We must not be so ready to believe that the person who was once dead, and who had been seen by more than 500 brethren at one time, and who had been seen by many other persons that were known to him before his resurrection, and who had not identified him after it, was the same person who was once dead, and who had been seen by more than 500 brethren at one time, and who had been seen by many other persons that were known to him before his resurrection, and who had not identified him after it. The story of stealing the body is a most senseless fiction, and the council would not have been so ready to believe it, had they not been so ready to believe that the person who was once dead, and who had been seen by more than 500 brethren at one time, and who had been seen by many other persons that were known to him before his resurrection, and who had not identified him after it, was the same person who was once dead, and who had been seen by more than 500 brethren at one time, and who had been seen by many other persons that were known to him before his resurrection, and who had not identified him after it. The story of stealing the body is a most senseless fiction, and the council would not have been so ready to believe it, had they not been so ready to believe that the person who was once dead, and who had been seen by more than 500 brethren at one time, and who had been seen by many other persons that were known to him before his resurrection, and who had not identified him after it, was the same person who was once dead, and who had been seen by more than 500 brethren at one time, and who had been seen by many other persons that were known to him before his resurrection, and who had not identified him after it.

Some of the objectors to it have also maintained, that possibly there is nothing material without us, that there is nothing mental within us, and that possibly the whole world is ideas. This mode of arguing we pretend not to explain; it is thought by some to proceed entirely from a perverseness of mind or disposition, while in books of

Resurrec-  
tion.

Resurrec-  
tion  
||  
Retarda-  
tion.

that the same bodies which have been accomplices in our vices and virtues, should also share in our rewards and punishments. Now, granting they will, shall one set of particles be bound for the crimes, or be entitled to receive the rewards, of the animal system, from its first commencement to its dissolution? or shall every particle rise up successively, and receive its dividend of rewards and punishments for the vices and virtues that belonged to the system during the time that they were in union with the sentient principle? and is the hand that fell in defending a father to be (as is supposed in some of the eastern countries) rewarded in heaven, while the other that struck him when the son became wicked, is punished into torments?

Finding this hypothesis supported by neither Scripture nor reason, they next appeal to the strictest facts. And they, it is confessed, are for the resurrection of the very same flesh. But this notion is directly contrary to the Scriptures, which have said, that flesh and blood are not to inherit the kingdom of God.

55  
State after  
the resur-  
rection.

But whatever be the bodies with which the dead are to be raised at the general resurrection, all mankind must appear in judgment, and receive sentence according to the deeds done in the body, without regard, so far as we know, to their actions and conduct in the middle state. After this sentence, the righteous are to enter into celestial and eternal joys, and the wicked to suffer the punishments of Hell. These punishments some have supposed to be everlasting; others think, that after some temporary punishment, the souls of the wicked are to be annihilated; and others imagine, that after doing purgatorial penance for a while in hell, they are to be again received into favour; inclining to explain the denunciations of the Almighty as a child would do the threatenings of his mother, or a lover the affected chidings of his mistress (A).

RESUSCITATION, the same with resurrection and revivification. See the preceding article and RE-ANIMATION.

The term *resuscitation*, however, is more particularly used by chemists for the reproducing a mixed body from its ashes; an art to which many have pretended, as to reproduce plants, &c. from their ashes.

RETAIL, in commerce, is the selling of goods in small parcels, in opposition to wholesale. See COMMERCE.

RETAINER, a servant who does not continually dwell in the house of his master, but only attends upon special occasions.

RETAINING FEE, the first fee given to a serjeant or counsellor at law, in order to make him stand, and prevent his pleading on the contrary side.

RETALIATION, among civilians, the act of returning like for like.

RETARDATION, in physics, the act of diminishing the velocity of a moving body. See QUANTITY, MECHANICS, PNEUMATICS, and PROPAGATION.

RETE MIRABILE, in anatomy, a small plexus or network of vessels in the brain, surrounding the pituitary gland.

Rete  
||  
Reticulum.

RETENTION is defined by Mr Locke to be, a faculty of the mind, whereby it keeps or retains those simple ideas it has once received, by sensation or reflection. See METAPHYSICS, Part I. Chap. II.

RETENTION is also used, in medicine, &c. for the state of contraction in the solids or vascular parts of the body, which makes them hold fast their proper contents. In this sense, retention is opposed to evacuation and excretion.

RETICULAR BODY (*corpus reticulare*), in anatomy, a very fine membrane, perforated, in the manner of a net, with a multitude of foramina. It is placed immediately under the cuticle; and when that is separated from the cutis, whether by art or accident, this adheres firmly to it, and is scarce possible to be parted from it, seeming rather to be its inner superficies than a distinct substance. In regard to this, we are to observe, first, the places in which it is found, being all those in which the sense of feeling is most acute, as in the palms of the hands, the extremities of the fingers, and on the soles of the feet. The tongue, however, is the part where it is most accurately to be observed, it is more easily distinguishable there than anywhere else, and its nature and structure are more evidently seen there.

Its colour in the Europeans is white; but in the negroes and other black nations it is black; in the tawny it is yellowish: the skin itself in both is white, and the blackness and yellowness depend upon the colour of this membrane.

The uses of the *corpus reticulare* are, first, to support the structure of the other parts of the skin, and to keep them in their situation; secondly, to give the apertures give passage to the humors, and to the papillae and excretory ducts, and to keep them in a certain and determinate situation, and not be removed from their places, and thirdly, there is a covering of the surface of the skin, and a covering for the sense of feeling.

Reticular, in Latin, means having a net or plying web, or a form applied by the Romans to the parts of their houses of constructing their buildings, or the city of Salina (see SALINA) and also to be seen remains of some walls, evidently of Roman origin from the same. The structure consists of small pieces of baked earth and lozenge-wise, and disposed with great regularity in the angles, so as to exhibit to the eye the appearance of net diamonds, and was called *reticular*, from its resemblance to fishing-nets. The Romans always concealed it under a regular coating of other matter; and Mr Huet informs us, that this was the only specimen of which he saw in all his travels through Sicily, Malta, and Lipari. It appears to be the remains of some baths, which

(A) The French convention, whose principles are equally new, daring, and destructive of all that is decent or of good report, have decided this question in a very summary way, by decreeing death to be an eternal sleep, a decree equally absurd in itself and fatal in its consequences. Since this article went to the press, however, we have learned, from the most respectable authority, that wild and absurd as the opinion is, it has been industriously propagated in this country, and that in some places it has gained ground. The consequences of this, were it to become general, must indeed be baneful beyond all conception; and we shall afterwards take occasion to expose the opinion and its nefarious consequences at greater length than it is now possible to do in this place. See THEOLOGY.

Retreat  
||  
Return.

that are weak, or in driving them ill-pointed, or otherwise amiss.

**RETREAT**, in a military sense. An army or body of men are said to retreat when they turn their backs upon the enemy, or are retiring from the ground they occupied: hence every march in withdrawing from the enemy is called a *retreat*.

That which is done in sight of an active enemy, who pursues with a superior force, is the most important part of the subject; and is, with reason, looked upon as the glory of the profession. It is a manœuvre the most delicate, and the properest to display the presence, genius, courage, and address, of an officer who commands. The historians of all ages testify it; and historians have never been so lavish of eulogiums as on the subject of the brilliant retreats of our heroes. If it is important, it is no less difficult to regulate, on account of the variety of circumstances, each of which demands different principles, and an almost endless detail. Hence a good retreat is esteemed, by experienced officers, the masterpiece of a general. He should therefore be well acquainted with the situation of the country through which he intends to make it, and careful that nothing is omitted to make it safe and honourable. See **WAR**.

**RETREAT**, is also a beat of the drum, at the firing of the evening gun; at which the drum-major, with all the drums of the battalion, except such as are upon duty, beats from the camp-colours on the right to those on the left, on the parade of encampment: the drums of all the guards beat also; the trumpets at the same time sounding at the head of their respective troops. This is to warn the soldiers to forbear firing, and the sentinels to challenge, till the break of day that the reveille is beat. The retreat is likewise called *setting the watch*.

**RETRENCHMENT** literally signifies something cut off or taken from a thing; in which sense it is the same with subtraction, diminution, &c.

**RETRENCHMENT**, in the art of war, any kind of work raised to cover a post, and fortify it against the enemy, such as fascines loaded with earth, gabions, barrels of earth, sand bags, and generally all things that can cover the men and stop the enemy. See **FORTIFICATION** and **WAR**.

**RETRIBUTION**, a handsome present, gratuity, or acknowledgment, given instead of a formal salary or hire, to persons employed in affairs that do not so immediately fall under estimation, nor within the ordinary commerce in money.

**RETROMINGENTS**, in natural history, a class or division of animals, whose characteristic is, that they stale or make water backwards, both male and female.

**RETURN** (*returna* or *retorna*), in law, is used in divers senses. 1. Return of writs by sheriffs and bailiffs is a certificate made by them to the court, of what they have done in relation to the execution of the writ directed to them. This is wrote on the back of the writ by the officer, who thus sends the writ back to the court from whence it issued, in order that it may be filed. 2. Return of a commission, is a certificate or answer sent to the court from whence the commission issues, concerning what has been done by the commissioners. 3. Returns, or days in bank, are certain days in each term, appointed for the return of writs, &c. Thus Hillary term has four returns, viz. in the king's-

Return  
||  
Retzia.

bench, on the day next after the octave, or eighth day after Hillary day: on the day next after the fifteenth day from St Hillary; on the day after Purification; and on the next after the octave of the Purification. In the common pleas, in eight days of St Hillary: from the day of St Hillary, in fifteen days: on the day after the Purification: in eight days of the Purification. Easter term has five returns, viz. in the king's-bench, on the day next after the fifteenth day from Easter: on the day next after the three weeks from Easter: on the day next after one month from Easter: on the day next after five weeks from Easter: and on the day next after the day following Ascension-day. In the common pleas, in fifteen days from the feast of Easter: in three weeks from the feast of Easter: in one month from Easter-day: in five weeks from Easter day: on the day after the Ascension-day. Trinity term has four returns, viz. on the day following the second day after Trinity: on the day following the eighth day after Trinity: on the day next after the fifteenth day from Trinity: on the day next after three weeks from Trinity. In the common pleas, on the day after Trinity: in eight days of Trinity: in fifteen days from Trinity: in three weeks from Trinity. Michaelmas term has six returns, viz. on the day next after three weeks from St Michael: on the day next after one month of St Michael: on the day following the second day after All-souls: on the day next after the second day after St Martin: on the day following the octave of St Martin. In the common pleas, in three weeks from St Michael: in one month from St Michael: on the day after All-souls: on the day after St Martin: in fifteen days from the octave of St Martin. It is to be observed, that, as in the king's-bench, the returns are to be made on *bank days*, and that in each term, care must be taken, not to make the writs out of that court, extending to a *bank day*; such as Sunday, and All-souls, &c. In Easter term, the Purification in Hilary, the octave in Easter, and Midsummer-day, except in the first day of Trinity term.

**RETURNS**, in a military sense, are of various sorts, but all tending to explain the state of the army, regiment, or company; namely, how many capable of doing duty, on duty, sick in quarters, barracks, infirmary, or hospital; prisoners, absent with or without leave; total effective; wanting to complete the establishments, &c.

**RETUSARI**, an island in Russia, is a long slip of *Gene's Terra* land, or rather sand, through the middle of which runs a ridge of granite. It is 20 miles from Petersburg by water, four from the shore of Ingria, and nine from the coast of Carolia. It is about 10 miles in circumference, and was overspread with firs and pines when Peter first conquered it from the Swedes. It contains at present about 30,000 inhabitants, including the sailors and garrison, the former of whom amount to about 12,000, the latter to 1500 men. The island affords a small quantity of pasture, produces vegetables, and a few fruits, such as apples, currants, gooseberries, and strawberries, which thrive in this northern climate.

**RETZ** (Cardinal de.) See **GONDI**.

**RETZIA**, in botany; a genus of the monogynia order, belonging to the pentandria class of plants, and

Reutlingen to the 29th natural order, *Campanaceæ*. The capsule is bilocular, the corolla cylindrical, and villous without; the stigma bifid.

REUTLINGEN, a handsome, free, and imperial town of Germany, in the circle of Suabia, and duchy of Wirtemberg; seated in a plain on the river Eschez, near the Neckar, adorned with handsome public buildings, and has a well frequented college. E. Long. 9. 10. N. Lat. 48. 31.

REVE, REEVE, or *Greve* the bailiff of a franchise, or manor, thus called, especially in the west of England. Hence shire-reeve, sherriff, port-greve, &c.

REVEILLE, a beat of drum about break of day, to give notice that it is time for the soldiers to arise, and that the sentries are to forbear challenging.

REVEL, a port town of Livonia, situated at the south entrance of the gulf of Finland, partly in a plain and partly on a mountain; 133 miles south-west of Petersburg, and 85 south-east of Abo. It is a place of great trade, and holds two fairs yearly, which are visited by merchants from all countries, but particularly by those of England and Holland. It is a strong and a rich place, with a capital harbour. It is surrounded with high walls and deep ditches, and defended by a castle and stout bastions. It was confirmed to the Swedes at the peace of Oliva, conquered by Peter the Great in 1710, and ceded to Russia in 1721. The conquest of it was again attempted by the Swedes in 1790. The duke of Sudermania, with the Swedish fleet, attempted to carry the harbour; but after an obstinate engagement with the Russian fleet, he was obliged to give it up; but it was but for a very short time. He retired about 10 leagues from the harbour, to where the Swedish fleet had sustained, and to prevent a further attack before any relief could be afforded to the Russians. As soon as he had retired, the Russian fleet was discovered, ready to dispute with the Swedes the entrance. Upon a council being held by the Duke, it was resolved to attack the Russians; and the signals being given, the fleet bore down for the attack, which was maintained for near six hours with the utmost fury; at length the Swedes broke the Russian line, which threw them into much confusion; when the Swedes, taking the advantage of the general confusion into which the Russians were thrown, followed them with their whole force into the harbour, where the conflict and carnage were dreadful on both sides, though the Swedes certainly had the worst of it; at the same time that their skill and bravery is indisputable.

This valuable place was again confirmed to Russia by the peace. The government of Revel or Elthonia is one of the divisions of the Russian empire, containing five districts. 1. Revel, on the Baltic sea. 2. Baltic-port, about 40 versts westward from Revel. 3. Hapsal, or Hapsal, a maritime town. 4. Weissenstein, on the rivulet Saïda, about 80 versts from Revel. 5. Wefenberg, about 100 versts from Revel, at about an equal distance from that town and Narva.

REVELATION, the act of revealing, or making a thing public that was before unknown; it is also used for the discoveries made by God to his prophets, and by them to the world; and more particularly for the books of the Old and New Testament. See BIBLE,

CHRISTIANITY, MIRACLE, RELIGION, and THEOLOGY.

The principal tests of the truth of any revelation, are the tendency of its practical doctrines; its consistency with itself, and with the known attributes of God; and some satisfactory evidence that it cannot have been derived from a human source.

Before any man can receive a written book as a revelation from God, he must be convinced that God exists, and that he is possessed of almighty power, infinite wisdom, and perfect justice. Now should a book teaching absurd or immoral doctrines (as many chapters of the Koran do, and as all the traditionary systems of Paganism did), pretend to be revealed by a God of wisdom and justice, we may safely reject its pretensions without farther examination than what is necessary to satisfy us that we have not misunderstood its doctrine. Should a book claiming this high origin, enjoin in one part of it, and forbid in another, the same thing to be done under the same circumstances, we may reject it with contempt and indignation; because a being of infinite wisdom can never act capriciously or absurdly. Still, however, as it is impossible for us to know how far the powers of men may reach in the investigation or discovery of useful truth, some farther evidence is necessary to prove a doctrine of divine origin, than its mere consistency with itself, and with the principles of morality; and this evidence can be nothing but the power of working miracles exhibited by him by whom it was originally revealed. In every revelation confirmed by this evidence, many doctrines are to be looked for which human reason cannot fully comprehend; and these are to be believed on the testimony of God, and suffered to produce their practical consequences. At this kind of belief the shallow infidel may smile contemptuously; but it has a place in arts and sciences as well as in religion. Whoever avails himself of the demonstrations of Newton, Bernoulli, and others, respecting the resistance of fluids, and applies these conclusions to the art of ship-building, is as implicit a believer, if he understand not the principles of fluxions, as any Christian; and yet no man will say that his faith is not productive of important practical consequences. He believes, however, in man, while the Christian believes in God; and therefore he cannot pretend that his faith rests on a surer foundation.

Mr Locke, in laying down the distinct provinces of reason and faith, observes, 1. That the same truths may be discovered by revelation which are discoverable to us by reason. 2. That no revelation can be admitted against the clear evidence of reason. 3. That there are many things of which we have but imperfect notions, or none at all; and others, of whose past, present, or future existence, by the natural use of our faculties we cannot have the least knowledge; and these, being beyond the discovery of our faculties, and above reason, when revealed, become the proper object of our faith. He then adds, that our reason is not injured or disturbed, but assisted and improved, by new discoveries of truth coming from the fountain of knowledge. Whatever God has revealed is certainly true; but whether it be a divine revelation or not, reason must judge, which can never permit the mind to respect a greater evidence to embrace what is less evi-

Revelation  
Revenue.

dent. There can be no evidence that any traditional revelation is of divine original, in the words we receive it, and the sense we understand it, so clear and so certain as that of the principles of reason: and, therefore nothing that is contrary to the clear and self-evident dictates of reason, has a right to be urged or assented to as a matter of faith, wherein reason has nothing to do.

REVELATION of St. John. See APOCALYPSE.

REVELS, entertainments of dancing, masking, acting comedies, farces, &c. anciently very frequent in the inns of court and in noblemen's houses, but now much disused. The officer who has the direction of the revels at court is called the *Master of the Revels*.

REVENGE, means the return of injury for injury, and differs materially from that sudden resentment which rises in the mind immediately on being injured; which, so far from being culpable when restrained within due bounds, is absolutely necessary for self-preservation. Revenge, on the contrary, is a cool and deliberate wickedness, and is often executed years after the offence was given; and the desire of it is generally the effect of littleness, weakness, and vice; while, to do right, and to suffer wrong, is an argument of a great soul, that scorns to stoop to suggested revenges.

Revenge is but a frailty incident  
To craz'd and sickly minds; the poor content  
Of little souls, unable to surmount  
An injury, too weak to bear affront. *Dryden.*

Revenge is generally the concomitant of savage minds, of minds implacable, and capable of the most horrid barbarities; unable to set any limits to their displeasure, they can confine their anger within no bounds of reason.

—Cruel revenge, which still we find  
The weakest frailty of a feeble mind.  
Degenerous passion, and for man too base,  
It seats its empire in the savage race.

*Juvenal.*

The institution of law prevents the execution of private revenge, and the growth of civilization shows its impropriety. Though in modern times a species of revenge is sanctioned by what is called the law of honour, which evades the law of the land indeed, but which is equally mean and disgraceful as the other kinds, and is of consequence equally baneful. See ANGER, DUALING, and RESENTMENT.

REVENUE, the annual income a person receives from the rent of his lands, houses, interest of money in the stocks, &c.

Royal REVENUE, that which the British constitution hath vested in the royal person, in order to support his dignity and maintain his power; being a portion which each subject contributes of his property, in order to secure the remainder. This revenue is either ordinary or extraordinary.

1. The king's ordinary revenue is such as has either subsisted time out of mind in the crown; or else has been granted by parliament, by way of purchase or exchange for such of the king's inherent hereditary revenues as were found inconvenient to the subject. In saying that it has subsisted time out of mind in the crown, we do not mean that the king is at pre-

sent in the actual possession of the whole of his revenue. Much (nay the greatest part) of it is at this day in the hands of subjects; to whom it has been granted out from time to time by the kings of England: which has rendered the crown in some measure dependent on the people for its ordinary support and subsistence. So that we must be obliged to recount, as part of the royal revenue, what lords of manors and other subjects frequently look upon to be their own absolute rights; because they and their ancestors are and have been vested in them for ages, though in reality originally derived from the grants of our ancient princes.

1. The first of the king's ordinary revenues, which may be taken notice of, is of an ecclesiastical kind (as are also the three succeeding ones), viz. the custody of the temporalities of bishops. See TEMPORALITIES.

2. The king is entitled to a CORODY, as the law calls it, out of every bishopric; that is, to send one of his chaplains to be maintained by the bishop, or to have a pension allowed him till the bishop promotes him to a benefice. This is also in the nature of an acknowledgement to the king, as founder of the see, since he had formerly the same corody or pension from every abbey or priory of royal foundation. It is supposed to be now fallen into total disuse; though Sir Matthew Hale says, that it is one of common right, and that no prescription will discharge it.

3. The king is also entitled to all the tithes arising in extraparochial places; though perhaps it may be doubted how far this article, as well as the last, may be properly reckoned a part of the king's own revenue; since a corody supports only one chaplain, and these extraparochial tithes are held under a supplied trust that the king will distribute them for the good of the clergy in general.

4. The next branch consists in the TENTHS, or tenths of all spiritual preferments, or the TENTHS.

5. The next branch of the king's ordinary revenue (which, as well as the subsequent branches, is of a lay or temporal nature) consists in the rents and profits of the demesne lands of the crown. These demesne lands, *terre domaniale* regis, being either the share reserved to the crown in the original distribution of landed property, or such as came to it afterwards by forfeiture, or other means, were anciently very large and extensive; comprising divers manors, honours, and lordships; the tenants of which had very peculiar privileges, when we speak of the tenure in ancient demesne. At present they are contracted within a very narrow compass, having been almost entirely granted away to private subjects. This has occasioned the parliament frequently to interpose; and particularly after King William III. had greatly impoverished the crown, an act passed, whereby all future grants or leases from the crown for any longer term than 31 years or three lives, are declared to be void; except with regard to houses, which may be granted for 50 years. And no reversionary lease can be made, so as to exceed, together with the estate in being, the same term of three lives or 31 years; that is, when there is a subsisting lease, of which there are 20 years still to come, the king cannot grant a future interest, to commence after the expiration of the former, for any longer term than 11 years.

**Revenue.** years. The tenant must also be made liable to be punished for committing waste; and the usual rent must be reserved, or, where there has usually been no rent, one-third of the clear yearly value. The misfortune is, that this act was made too late, after almost every valuable possession of the crown had been granted away for ever, or else upon very long leases; but may be of benefit to posterity, when those leases come to expire.

6. Hitherto might have been referred the advantages which were used to arise to the king from the profits of his military tenures, to which most lands in the kingdom were subject, till the statute 12 Car. II. c. 24. which in great measure abolished them all. Hitherto also might have been referred the profitable prerogative of purveyance and pre-emption: which was a right enjoyed by the crown of buying up provisions and other necessaries, by the intervention of the king's purveyors, for the use of his royal household, at an appraised valuation, in preference to all others, and even without consent of the owner: and also of forcibly impressing the carriages and horses of the subject, to do the king's business on the public roads, in the conveyance of timber, baggage, and the like, however inconvenient to the proprietor, upon paying him a settled price. A prerogative which prevailed pretty generally throughout Europe during the scarcity of gold and silver, and the high valuation of money consequential thereupon. In those early times, the king's household (as well as those of inferior lords) were supported by specific renders of corn, and other victuals, from the tenants of the respective demesnes; and there was also a continual market kept at the palace-gate to furnish viands for the royal table. And this answered all purposes, in those early times, so long as the king's court continued in any certain place. But when it removed from one part of the kingdom to another (as was formerly very frequently done), it was found necessary to send purveyors beforehand, to get together a sufficient quantity of provisions and other necessaries for the household, and lest the usual demand should raise them to an exorbitant price, the powers before-mentioned were vested in these purveyors, who in process of time very greatly abused their authority, and became a great oppression to the subject, though of little advantage to the crown: ready money in open market (when the royal residence was more permanent, and specie began to be plenty) being found upon experience to be the best provider of any. Wherefore, by degrees, the powers of purveyance have declined, in foreign countries as well as our own; and particularly were abolished in Sweden by Gustavus Adolphus, towards the beginning of the last century. And, with us in England having fallen into disuse during the suspension of monarchy, King Charles, at his restoration, consented, by the same statute, to resign entirely those branches of his revenue and power: and the parliament, in part of recompense, settled on him, his heirs, and successors, for ever, the hereditary excise of 15d. per barrel on all beer and ale sold in the kingdom, and a proportionable sum for certain other liquors. So that this hereditary excise now forms the sixth branch of his majesty's ordinary revenue.

7. A seventh branch might also be computed to have

VOL. XVI. Part I.

arisen from wine licences; or the rents payable to the crown by such persons as are licensed to sell wine by retail throughout Britain, except in a few privileged places. These were first settled on the crown by the statute 12 Car. II. c. 25. and, together with the hereditary excise, made up the equivalent in value for the loss sustained by the prerogative in the abolition of the military tenures, and the right of pre-emption and purveyance; but this revenue was abolished by the statute 30 Geo. II. c. 19. and an annual sum of upwards of 7000l. ~~per annum~~, issuing out of the new stamp-duties imposed on wine licences, was settled on the crown in its stead.

8. An eighth branch of the king's ordinary revenue is usually reckoned to consist in the profits arising from his forests. See FOREST. These consist principally in the amercements or fines levied for offences against the forest laws. But as few, if any, courts of this kind for levying amercements have been held since 1632, 8 Char. I. and as, from the accounts given of the proceedings in that court by our histories and law-books, nobody would wish to see them again revived, it is needless to pursue this inquiry any farther.

9. The profits arising from the king's ordinary courts of justice make a ninth branch of his revenue. And these consist not only in fines imposed upon offenders, forfeitures of recognizances, and amercements levied upon defaulters; but also in certain fees due to the crown in a variety of legal matters, as, for setting the great seal to charters, original writs, and other forensic proceedings, and for permitting fines to be levied of lands in order to bar entails, or otherwise to ensure their title. As none of these can be done without the immediate intervention of the king, by himself or his officers, the law allows him certain perquisites and profits, as a recompense for the trouble he undertakes for the public. These in process of time, have been almost all granted out to private persons, or else appropriated to certain particular uses: so that, though our law proceedings are still loaded with their payment, very little of them is now returned into the king's exchequer; for a part of whose royal maintenance they were originally intended. All future grants of them, however, by the statute 1 Ann. St. 2. c. 7. are to endure for no longer time than the prince's life who grants them.

10. A tenth branch of the king's ordinary revenue, said to be grounded on the consideration of his guarding and protecting the seas from pirates and robbers, is the right to *royal fish*, which are whale and sturgeon: and these, when either thrown ashore, or caught near the coasts, are the property of the king, on account of their superior excellence. Indeed, our ancestors seem to have entertained a very high notion of the importance of this right; it being the prerogative of the kings of Denmark and the dukes of Normandy; and from one of these it was probably derived to our princes.

11. Another maritime revenue, and founded partly upon the same reason, is that of *SHIPWRECKS*. See WRECK.

12. A twelfth branch of the royal revenue, the right to mines, has its original from the king's prerogative of coinage, in order to supply him with materials; and therefore

*Revenue.* therefore those mines which are properly royal, and to which the king is entitled when found, are only those of silver and gold. See *MINE*.

13. To the same original may in part be referred the revenue of treasure-trove. See *TREASURE-TROVE*.

14. Waifs. See *WAIF*.

15. Estrays. See *ESTRAY*.

Besides the particular reasons, given in the different articles, why the king should have the several revenues of royal fish, shipwrecks, treasure-trove, waifs, and estrays, there is also one general reason which holds for them all; and that is, because they are *bona vacantia*, or goods in which no one else can claim a property. And, therefore, by the law of nature, they belonged to the first occupant or finder; and so continued under the imperial law. But, in settling the modern constitutions of most of the governments in Europe, it was thought proper (to prevent that strife and contention which the mere title of occupancy is apt to create and continue, and to provide for the support of public authority in a manner the least burdensome to individuals) that these rights should be annexed to the supreme power by the positive laws of the state. And so it came to pass, that, as Bracton expresses it, "hæc, quæ nullius in bonis sunt, et olim fuerunt inventoris de jure naturali, jam efficiuntur principis de jure gentium."

16. The next branch of the king's ordinary revenue consists in forfeitures of lands and goods for offences; *bona confiscata*, as they are called by the civilians, because they belonged to the *fiscus* or imperial treasury; or, as our lawyers term them, *foris facta*, that is, such whereof the property is gone away or departed from the owner. The true reason and only substantial ground of any forfeiture for crimes, consist in this: that all property is derived from society, being one of those civil rights which are conferred upon individuals, in exchange for that degree of natural freedom which every man must sacrifice when he enters into social communities. If, therefore, a member of any national community violates the fundamental contract of his association, by transgressing the municipal law, he forfeits his right to such privileges as he claims by that contract; and the state may very justly resume that portion of property, or any part of it, which the laws have before assigned him. Hence, in every offence of an atrocious kind, the laws of England have exacted a total confiscation of the moveables or personal estate; and, in many cases, a perpetual, in others only a temporary, loss of the offender's immoveables or landed property; and have vested them both in the king, who is the person supposed to be offended, being the one visible magistrate in whom the majesty of the public resides. See *FORFEITURE* and *DEODAND*.

17. Another branch of the king's ordinary revenue arises from escheats of lands, which happen upon the defect of heirs to succeed to the inheritance; whereupon they in general revert to and vest in the king, who is esteemed, in the eye of the law, the original proprietor of all lands in the kingdom.

18. The last branch of the king's ordinary revenue consists in the custody of idiots, from whence we shall be naturally led to consider also the custody of lunatics. See *IDIOT* and *LUNATIC*.

This may suffice for a short view of the king's ordi-

*Revenue.* nary revenue, or the proper patrimony of the crown; which was very large formerly, and capable of being increased to a magnitude truly formidable: for there are very few estates in the kingdom that have not, at some period or other since the Norman conquest, been vested in the hands of the king, by forfeiture, escheat, or otherwise. But fortunately for the liberty of the subject, this hereditary landed revenue, by a series of improvident management, is sunk almost to nothing; and the casual profits, arising from the other branches of the *census regalis*, are likewise almost all of them alienated from the crown. In order to supply the deficiencies of which, we are now obliged to have recourse to new methods of raising money, unknown to our early ancestors; which methods constitute—

II. The king's extraordinary revenue. For, the public patrimony being got into the hands of private subjects, it is but reasonable that private contributions should supply the public service. Which, though it may perhaps fall harder upon some individuals, whose ancestors have had no share in the general plunder, than upon others, yet, taking the nation throughout, it amounts to nearly the same; provided the gain by the extraordinary should appear to be no greater than the loss by the ordinary revenue. And perhaps, if every gentleman in the kingdom was to be stripped of such of his lands as were formerly the property of the crown, was to be again subject to the inconveniences of purveyance and pre-emption, the oppression of forest laws, and the slavery of feudal tenures; and was to resign into the king's hands all his royal franchises of waifs, wrecks, estrays, treasure-trove, mines, deodands, forfeitures, and the like; he would find himself a greater loser than by paying his *quota* to such taxes as are necessary to the support of government. The thing, therefore, to be wished and aimed at is a land of liberty, is by no means the total abolition of taxes, which would draw after it very pernicious consequences, and the very supposition of which is the height of political absurdity. For as the true idea of government and magistracy will be found to consist in this, that some few men are deputed by many others to preside over public affairs, so that individuals may the better be enabled to attend their private concerns; it is necessary that those individuals should be bound to contribute a portion of their private gains, in order to support that government, and reward that magistracy, which protects them in the enjoyment of their respective properties. But the things to be aimed at are wisdom and moderation, not only in granting, but also in the method of raising, the necessary supplies; by contriving to do both in such a manner as may be most conducive to the national welfare, and at the same time most consistent with economy and the liberty of the subject; who, when properly taxed, contributes only, as was before observed, some part of his property in order to enjoy the rest.

These extraordinary grants are usually called by the synonymous names of *aids*, *subsidies*, and *supplies*; and are granted by the commons of Great Britain, in parliament assembled. See *PARLIAMENT* and *TAX*.

The clear nett produce of the several branches of the revenue, after all charges of collecting and management paid, amounted in the year 1786 to about 15,397,000*l.* sterling, while the expenditure was found

**Revenue** found to be about 14,477,000l. How these immense sums are appropriated, is next to be considered. And this is, first and principally, to the payment of the interest of the national debt. See *NATIONAL DEBT AND FUNDS*.

The respective produces of the several taxes were originally separate and distinct funds; being securities for the sums advanced on each several tax, and for them only. But at last it became necessary, in order to avoid confusion, as they multiplied yearly, to reduce the number of these separate funds, by uniting and blending them together; superadding the faith of parliament for the general security of the whole. So that there are now only three capital funds of any account; the *aggregate* fund, and the *general* fund, so called from such union and addition; and the *South-Sea* fund, being the produce of the taxes appropriated to pay the interest of such part of the national debt as was advanced by that company and its annuitants. Whereby the separate funds, which were thus united, are become mutual securities for each other; and the whole produce of them, thus aggregated, liable to pay such interest or annuities as were formerly charged upon each distinct fund: the faith of the legislature being moreover engaged to supply any casual deficiencies.

The customs, excises, and other taxes, which are to support these funds, depending on contingencies, upon exports, imports, and consumptions, must necessarily be of a very uncertain amount: but they have always been considerably more than was sufficient to answer the charge upon them. The surplusses, therefore, of the three great national funds, the *aggregate*, *general*, and *South-Sea* fund, over and above the interest and annuities charged upon them, are directed by statute 3 Geo. III. c. 7. to be carried together, and to attend the disposition of parliament; and are usually denominated the *sinking fund*, because originally destined to sink and lower the national debt. To this have been since added many other entire duties, granted in subsequent years; and the annual interest of the sums borrowed on their respective credits is charged on, and payable out of, the produce of the sinking fund. However, the nett surplusses and savings, after all deductions paid, amount annually to a very considerable sum. For as the interest on the national debt has been at several times reduced (by the consent of the proprietors, who had their option either to lower their interest or be paid their principal), the savings from the appropriated revenues must needs be extremely large.

But, before any part of the aggregate fund (the surplusses whereof are one of the chief ingredients that form the sinking fund) can be applied to diminish the principal of the public debt, it stands mortgaged by parliament to raise an annual sum for the maintenance of the king's household and the civil list. For this purpose, in the late reigns, the produce of certain branches of the excise and customs, the post-office, the duty on wine licenses, the revenues of the remaining crown lands, the profits arising from courts of justice, (which articles include all the hereditary revenues of the crown), and also a clear annuity of 120,000l. in money, were settled on the king for life, for the support of his majesty's household, and the honour and dignity of the crown. And, as the amount of these several branches was uncertain, (though in the last reign they were computed to have sometimes raised almost

a million), if they did not arise annually to 800,000l. the parliament engaged to make up the deficiency. But his present majesty having, soon after his accession, spontaneously signified his consent that his own hereditary revenues might be so disposed of as might best conduce to the utility and satisfaction of the public, and having graciously accepted a limited sum, the said hereditary and other revenues are now carried into, and made a part of, the aggregate fund; and the aggregate fund is charged with the payment of the whole annuity to the crown. The limited annuity accepted by his present majesty was at first 800,000l. but it has been since augmented to 900,000l. The expences themselves, being put under the same care and management as the other branches of the public patrimony, produce more and are better collected than heretofore; and the public is a gainer of upwards of 100,000l. per annum by this disinterested bounty of his majesty.

The sinking fund, though long talked of as the last resource of the nation, proved very inadequate to the purpose for which it was established. Ministers found pretences for diverting it into other channels; and the diminution of the national debt proceeded slowly during the intervals of peace, whilst each succeeding war increased it with great rapidity. To remedy this evil, and restore the public credit, to which the late war had given a considerable shock, Mr Pitt conceived a plan for diminishing the debt by a fund, which should be rendered unalienable to any other purpose. In the session 1786, he moved that the annual surplus of the revenue above the expenditure should be raised, by additional taxes, from 900,000l. to one million sterling, and that certain commissioners should be vested with the full power of disposing of this sum in the purchase of stock (see *FUNDS*), for the public, in their own names. These commissioners should receive the annual million by quarterly payments of 250,000, to be issued out of the exchequer before any other money, except the interest of the national debt itself; by these provisions, the fund would be secured, and no deficiencies in the national revenues could affect it, but such must be separately provided for by parliament.

The accumulated compound interest on a million yearly, together with the annuities that would fall into that fund, would, he said, in 28 years amount to such a sum as would leave a surplus of four millions annually, to be applied, if necessary, to the exigencies of the state. In appointing the commissioners, he should, he said, endeavour to choose persons of such weight and character as corresponded with the importance of the commission they were to execute. The speaker of the house of commons, the chancellor of the exchequer, the master of the rolls, the governor and deputy governor of the bank of England, and the accountant-general of the high court of chancery, were persons who, from their several situations, he should think highly proper to be of the number.

To the principle of this bill no objection was made, though several specious but ill-founded ones were urged against the sufficiency of the mode which the chancellor of the exchequer had adopted for the accomplishment of so great and so desirable an end. He had made it a clause in his bill, that the accumulating million should never be applied but to the purchase of stock. To this clause Mr Fox objected, and moved that the commi-

Revenue  
Reverie.

sioners therein named should be empowered to accept so much of any future loan as they should have cash belonging to the public to pay for. This, he said, would relieve that distress the country would otherwise be under, when, on account of a war, it might be necessary to raise a new loan: whenever that should be the case, his opinion was, that the minister should not only raise taxes sufficiently productive to pay the interest of the loan, but also sufficient to make good to the sinking fund whatsoever had been taken from it.

If, therefore, for instance, at any future period a loan of six millions was proposed, and there was at that time one million in the hands of the commissioners, in such case they should take a million of the loan, and the *bonus* or *douceur* thereupon should be received by them for the public. Thus government would only have five millions to borrow instead of six; and from such a mode of proceeding, he said, it was evident great benefit would arise to the public.

This clause was received by Mr Pitt with the strongest marks of approbation, as was likewise another, moved by Mr Pulteney, enabling the commissioners named in the bill to continue purchasing stock for the public when it is above par, unless otherwise directed by parliament. With these additional clauses the bill was read a third time on the 15th of May, and carried up to the lords, where it also passed without meeting with any material opposition, and afterwards received the royal assent.

The operation of this bill surpassed perhaps the minister's most sanguine expectation. The fund was ably managed, and judiciously applied; and in 1793 the commissioners had extinguished some millions of the public debt. The war, however, into which the nation was that year involved, and of which there is yet no certain prospect of a near end, has made it necessary to borrow additional sums, so large, that many years of peace must elapse before the operation of the fund can contribute sensibly to the relief of the people. The clear produce of the taxes raised on the people of this country was, in the year 1792, very near 17,000,000*l.*; and it must henceforth, from the accumulation of the debt, and the enormous expence of the present war, be necessarily rendered greater.

REVENUE, in hunting, a fleshy lump formed chiefly by a cluster of whitish worms on the head of the deer, supposed to occasion the casting of their horns by gnawing them at the root.

REVERBERATION, in physics, the act of a body repelling or reflecting another after its impinging thereon.

REVERBERATION, in chemistry, denotes a kind of circulation of the flame by means of a reverberatory furnace.

REVERBERATORY, or *REVERBERATING Furnace*. See *CHEMISTRY Index at Furnace*, and *FURNACE*.

REVEREND, a title of respect given to ecclesiastics.—The religious abroad are called *reverend fathers*, and abbesses, prioresses, &c. *reverend mothers*. In England, bishops are *right reverend*, and archbishops *most reverend*. In France, before the Revolution, their bishops, archbishops, and abbots, were all alike *most reverend*. In Scotland the clergy individually are *reverend*, a synod is *very reverend*, and the general assembly is *venerable*.

REVERIE, the same with delirium, raving, or distraction. It is used also for any ridiculous, extra-

vagant imagination, action, or proposition, a chimera, or vision. But the most ordinary use of the word among English writers, is for a deep disorderly musing or meditation.

REVERSAL of JUDGMENT, in law. A judgment may be falsified, reversed, or voided, in the first place, *without a writ of error*, for matters foreign to or *dehors* the record, that is, not apparent upon the face of it; so that they cannot be assigned for error in the superior court, which can only judge from what appears in the record itself; and therefore, if the whole record be not certified, or not truly certified, by the inferior court, the party injured thereby (in both civil and criminal cases) may allege a diminution of the record, and cause it to be rectified. Thus, if any judgment whatever be given by persons who had no good commission to proceed against the person condemned, it is void; and may be falsified by showing the special matter, without writ of error. As, where a commission issues to A and B, and twelve others, or any two of them, of which A or B shall be one, to take and try indictments; and any of the other twelve proceed without the interposition or presence of either A or B; in this case all proceedings, trials, convictions, and judgments, are void for want of a proper authority in the commissioners, and may be falsified upon bare inspection, without the trouble of a writ of error; it being a high misdemeanour in the judges so proceeding, and little (if any thing) short of murder in them all, in case the person so attainted be executed and suffer death. So likewise if a man purchases land of another; and afterwards the vender is, either by outlawry or his own confession, convicted and attainted of treason or felony previous to the sale or alienation; whereby such land becomes liable to forfeiture or escheat: now, upon any trial, the purchaser is at liberty, without bringing any writ of error, to falsify not only the time of the felony or treason supposed, but the very point of the felony or treason itself; and is not concluded by the confession or the outlawry of the vender, though the vender himself is concluded, and not suffered now to deny the fact, which he has by confession or flight acknowledged. But if such attainder of the vender was by verdict, on the oath of his peers, the alienee cannot be received to falsify or contradict the *fact* of the crime committed; though he is at liberty to prove a mistake in *time*, or that the offence was committed after the alienation, and not before.

Secondly, A judgment may be reversed, by writ of error which lies from all inferior criminal jurisdictions to the court of king's-bench, and from the king's-bench to the house of peers; and may be brought for notorious mistakes in the judgment or other parts of the record: as where a man is found guilty of perjury, and receives the judgment of felony, or for other less palpable errors; such as any irregularity, omission, or want of form in the process of outlawry, or proclamations; the want of a proper addition to the defendant's name, according to the statute of additions; for not properly naming the sheriff or other officer of the court, or not duly describing where his county-court was held: for laying an offence, committed in the time of the late king, to be done against the peace of the present; and for many other similar causes, which (though allowed out of tenderness to life and liberty) are not much to the credit or advancement of the national justice.—These writs of error, to reverse judgments in case of misdemeanours,

Reversal

**Reversal** misdemeanours, are not to be allowed of course, but on sufficient probable cause shown to the attorney-general; and then they are understood to be grantable of common right, and *ex debito justitiae*. But writs of error to reverse attainders in capital cases are only allowed *ex gratia*: and not without express warrant under the king's sign-manual, or at least by the consent of the attorney-general. These therefore can rarely be brought by the party himself, especially where he is attainted for an offence against the state: but they may be brought by his heir or executor after his death, in more favourable times; which may be some consolation to his family. But the easier and more effectual way is,

• Lastly, To reverse the attainder by act of parliament. This may be and hath been frequently done upon motives of compassion, or perhaps the zeal of the times, after a sudden revolution in the government, without examining too closely into the truth or validity of the errors assigned. And sometimes, though the crime be universally acknowledged and confessed, yet the merits of the criminal's family shall after his death obtain a restitution in blood, honours, and estate, or some or one of them, by act of parliament; which (so far as it extends) has all the effect of reversing the attainder, without casting any reflections upon the justice of the preceding sentence. See **ATTAINDER**.

The effect of falsifying or reversing an outlawry is, that the party shall be in the same plight as if he had appeared upon the *capias*: and, if it be before plea pleaded, he shall be put to plead to the indictment; if, after conviction, he shall receive the sentence of the law; for all the other proceedings, except only the process of outlawry for his non-appearance, remain good and effectual as before. But when judgment, pronounced upon conviction, is falsified or reversed, all former proceedings are absolutely set aside, and the party stands as if he had never been at all accused; restored in his credit, his capacity, his blood, and his estates: with regard to which last, though they be granted away by the crown, yet the owner may enter upon the grantee, with as little ceremony as he might enter upon a disseisor.— But he still remains liable to another prosecution for the same offence: for, the first being erroneous, he never was in jeopardy thereby.

**REVERSE** of a medal, coin, &c. denotes the second or back side, in opposition to the head or principal figure.

**REVERSION**, in Scots law. See Law, N° clxix. 1—3.

**REVERSION**, in the law of England, has two significations; the one of which is an estate left, which continues during a particular estate in being; and the other is the returning of the land, &c. after the particular estate is ended; and it is further said to be an interest in lands, when the possession of it fails, or where the estate which was for a time parted with, returns to the granters, or their heirs. But, according to the usual definition of a reversion, it is the residue of an estate left in the grantor after a particular estate granted away ceases, continuing in the grantor of such an estate.

The difference between a remainder and a reversion consists in this, that the remainder may belong to any man except the grantor; whereas the reversion returns to him who conveyed the lands, &c.

In order to render the doctrine of reversions easy, we shall give the following table; which shows the present value of one pound, to be received at the end of any number of years not exceeding 40; discounting at the rate of 5, 4, and 3 per cent. compound interest.

Years	Value at 5 per ct.	Value at 4 per ct.	Value at 3 per ct.
1	.9524	.9615	.9709
2	.9070	.9245	.9426
3	.8638	.8898	.9151
4	.8227	.8548	.8885
5	.7835	.8219	.8626
6	.7462	.7903	.8375
7	.7107	.7599	.8131
8	.6768	.7307	.7894
9	.6446	.7026	.7664
10	.6139	.6756	.7441
11	.5847	.6496	.7224
12	.5568	.6246	.7014
13	.5303	.6006	.6809
14	.5051	.5775	.6611
15	.4810	.5553	.6419
16	.4581	.5339	.6232
17	.4363	.5134	.6050
18	.4155	.4936	.5874
19	.3957	.4746	.5703
20	.3769	.4564	.5537
21	.3589	.4388	.5375
22	.3418	.4219	.5219
23	.3255	.4057	.5067
24	.3100	.3901	.4919
25	.2953	.3757	.4776
26	.2812	.3607	.4637
27	.2678	.3468	.4502
28	.2551	.3335	.4371
29	.2429	.3206	.4243
30	.2314	.3083	.4120
31	.2204	.2965	.4000
32	.2099	.2851	.3883
33	.1999	.2741	.3770
34	.1903	.2636	.3660
35	.1813	.2534	.3554
36	.1726	.2437	.3450
37	.1644	.2343	.3350
38	.1566	.2253	.3252
39	.1491	.2166	.3158
40	.1420	.2083	.3066

The use of the preceding table.—To find the present value of any sum to be received at the end of a given term of years, discounting at the rate of 3, 4, or 5 per cent. compound interest. Find by the above table the present value of 1l. to be received at the end of the given term; which multiply by the number of pounds proposed, (cutting off four figures from the product on account of the decimals) then the result will be the value sought: For example, the present value of 10,000l.

Revivification.   
 Re-union.   
 to be received 10 years hence, and the rate of interest 5 per cent. is equal to  $.6139 \times 10,0000 = 6139.0000$ . or 6139l. Again, the present value of 10,000l. due in ten years, the rate of interest being 3 per cent. is  $.7441 \times 10,000 = 7441$ .

*Reversion of Series*, in algebra, a kind of reversed operation of an infinite series. See *SERIES*.

**REVIVIFICATION**, in chemistry, a term generally applied to the distillation of quicksilver from cinnabar.

**COMMISSION OF REVIEW**, is a commission sometimes granted, in extraordinary cases, to revise the sentence of the court of delegates, when it is apprehended they have been led into a material error. This commission the king may grant, although the statutes 24 and 25 Hen. VIII. declare the sentence of the delegates definitive: because the pope, as supreme head by the canon law, used to grant such commission of review; and such authority as the pope heretofore exerted is now annexed to the crown by statutes 26 Hen. VIII. c. 1. and 1 Eliz. c. 1. But it is not matter of right, which the subject may demand *ex debito justitiæ*; but merely a matter of favour, and which therefore is often denied.

**REVIEW**, is the drawing out all or part of the army in line of battle, to be viewed by the king, or a general, that they may know the condition of the troops.

At all reviews, the officers should be properly armed, ready in their exercise, salute well, in good time, and with a good air; their uniform genteel, &c. The men should be clean and well dressed; their accoutrements well put on; very well sized in their ranks; the sergeants expert in their duty, drummers perfect in their beatings, and the fifers play correct. The manual exercise must be performed in good time, and with life; and the men carry their arms well; march, wheel, and form with exactness. All manœuvres must be performed with the utmost regularity, both in quick and slow time. The firings are generally 36 rounds; viz. by companies; by grand divisions; by subdivisions; obliquely, advancing, retreating; by files; in the square; street firings, advancing and retreating; and lastly, a volley. The intention of a review is, to know the condition of the troops: see that they are complete and perform their exercise and evolutions well.

**REVIEW** is also applied to Literary Journals, which give a periodical view of the state of literature;—as the Monthly Review, the Critical Review, the British Critic, and Analytical Review, &c.

**RE-UNION ISLAND**, an island in the South sea, discovered by the French on the 16th December 1773; lying, according to M. de Pages, in latitude  $48^{\circ} 21''$ , and longitude  $66^{\circ} 47''$ , the variation of the needle being  $30^{\circ}$  always towards north-west. The road and harbour are extremely good, and the latter from 16 to 8 fathoms deep at the very shore. The coast on each side is lofty, but green, with an abrupt descent, and swarms with a species of bustards. The penguins and sea-lions, which swarmed on the sands, were nowise alarmed at the approach of those who landed; from whence M. de Pages concluded that the country was wholly uninhabited. The soil produces a kind of grass, about five inches long, with a broad black leaf, and seemingly of a rich quality—but there was no vestige of a tree or

human habitation. See *Travels round the World* by M. de Pages, Vol. III. chap. viii. and ix.

**REVOLUTION**, in politics, signifies a change in the constitution of a state; and is a word of different import from *revolt*, with which it is sometimes confounded. When a people withdraw their obedience from their governors for any particular reason, without overturning the government, or waging an offensive war against it, they are in a state of revolt; when they overturn the government and form a new one for themselves, they effect a *revolution*.

That which is termed *the revolution* in Britain is the change which, in 1688, took place in consequence of the forced abdication of King James II. when the Protestant succession was established, and the constitution restored to its primitive purity. Of this important transaction, which confirmed the rights and liberties of Britons, we have endeavoured to give an impartial account under another article (see *BRITAIN*, N<sup>o</sup> 281, &c.) Of the rise and progress of the American revolution, which is still fresh in the memory of our readers, a large detail is given under the article *AMERICA*: But there are two other revolutions yet depending, of which some account will be expected in this place.

The Polish revolution, which, in all its circumstances, was perhaps the least exceptionable of any in the records of history, we have already traced to the period when the amiable king, over-awed by the arms of Russia, was obliged to undo his patriotic work, and give his sanction to the restoration of the old and wretched government (see *POLAND*). Since that period, Kosciusko's army has been completely defeated, himself made a prisoner, Warsaw taken, and the whole kingdom subdued by the powers combined against it. What will be the consequence of this success, may perhaps be conceived, but the rumours of the day are various. At one time we are told, that Poland is to be no longer an independent state, but to be divided among the three great powers which formerly wrested from it some of its most valuable provinces. At another time, we hear of the disinterested intimation of the empress, to restore the king to his original authority; although she has, in the mean time, driven him from his capital, where she herself exercises sovereign power. And a third report says, that Stanislaus is to retire with a large pension, and a Russian prince to step into his throne. The first of these rumours we think much more probable than the other two: especially as it seems confirmed by the following letter sent from Grodno, on the 18th of January, by the unfortunate king to the British ambassador.

"MY DEAR GARDINER—The characters with which you and I have been invested seem to be now almost at an end. I do not expect to see you again, but it is of importance to me to bid you farewell; and this I do from the bottom of my heart. You will preserve a place in my heart till death; and I hope that at last we shall meet again, in a place where upright minds, according to my opinion, will be for ever united.

"Every thing belonging to the usual etiquette has been so much deranged and interrupted by my sad fate, that most probably neither you nor I will be able to fulfil the diplomatic customs.

"But be assured, that I love and honour your king and

Revolution and nation. This you will apprise them of. Be assured also, that I wish you should preserve an affection towards your friend. If I am able to speak to you no more, my picture will speak to you for me! (Signed) STANISLAUS AUGUSTUS, KING."

This shows, at least, the fate of the king; and leaving that of the kingdom to be ascertained by time, we proceed to fulfil a promise which we made respecting another revolution, to which all the nations of Europe are still looking with anxiety and alarm.

5  
French.

When treating of France under a former article, we stated a few of the more striking historical facts which led to the commencement of the revolution; and we now come to trace the series of transactions which have marked its terrible career. In doing this, we shall compress our ideas as much as possible; and out of the endless variety of materials of which the public are in possession, we shall endeavour to extract a short and, if possible, a tolerably clear detail. For this purpose, however, it will be necessary that we begin, by stating the internal situation of France at the period immediately preceding the revolution, along with the more obvious political circumstances which contributed to the production of that event. The moral history of man is always more important than the mere recital of any physical occurrences that may take place in his lot. It is not the fall of a mighty monarch and the dispersion of his family; it is not the convulsion of empires, and the oceans of human blood which have been shed, that render the French revolution peculiarly interesting. Such events, however deplorable, are far from being without example in the history of mankind. In the populous regions of the east, where superstition and slavery have always prevailed, they are regarded as forming a part of the ordinary course of human affairs; because an intrepid and skilful usurper finds it easy to intimidate or ensnare millions of weak and credulous men. In Europe the case is very different; no adventurer can advance far without encountering thousands as artful and as daring as himself. Events are not the result either of blind hazard or of individual skill; conspiracies or plots produce little effect. Like other arts, the art of government has been brought to much perfection; and an established constitution can only be shaken by the strong convulsion produced by national passions and efforts. The wonderful spectacle which we are now to contemplate, is that of a mild and polished people becoming in an instant sanguinary and fierce; a well established government, celebrated for its dexterity and skill, overturned almost without a struggle; a whole nation apparently uniting to destroy every institution which antiquity had hallowed or education taught them to respect; a superstitious people treating the religion of their fathers with contempt; a long enslaved people, whose very chains had become dear to them, occupied in their public councils in the discussion of refined, and even visionary schemes of freedom: in short, 25,000,000 of persons suddenly treading under foot every sentiment and every prejudice that they themselves had once regarded as sacred and venerable.

6  
France was formerly under a barbarous aristocracy.

Like the other nations of Europe, France was anciently governed by a barbarous aristocracy, whose different members were feebly united by the authority of a succession of kings destitute of power or influence. The nobles, within their own territories, enjoyed privi-

leges entirely royal: they made peace and war; they coined money; they were judges on the last resort; their vassals were their slaves, whom they bought and sold along with the lands; the inhabitants of cities, although freemen, were depressed and poor, depending for protection upon some tyrannical baron in their neighbourhood. At length, however, by the progress of the arts, the cities rose into considerable importance, and their inhabitants, along with such freemen of low rank as resided in the country, were considered as entitled to a representation in the states-general of the kingdom, under the appellation of *tiers état*, or *third estate*; the clergy and the nobles forming the two first estates. But the sovereign, having speedily become despotic, the meetings of the states-general were laid aside. This absolute authority, on the part of the crown, was not acquired, as it was in England by the house of Tudor, by abolishing the pernicious privileges of the nobles and elevating the commons; but by skilful encroachments, by daring exertions of prerogative, and the use of a powerful military force. In France, therefore, the monarch was absolute, yet the nobles retained all their feudal privileges, and the ecclesiastical hierarchy did the same. The following was, in a few words, the state of that country during these two last centuries.

The kingdom of France, previous to the revolution, was never reduced to one homogeneous mass. It consisted of a variety of separate provinces acquired by different means; some by marriage, some by legacy, and others by conquest. Each province retained its ancient laws and privileges, whether political or civil, as expressed in their capitularies or conditions by which they were originally acquired. In one part of his dominions the French monarch was a count, in another he was a duke, and in others he was a king; the only bond which united his vast empire being the strong military force by which it was overawed. Each province had its barriers; and the intercourse between one province and another was often more restrained by local usages than the intercourse of either with a foreign country. Some of the provinces, such as Bretagne and Dauphiné, even retained the right of assembling periodically their provincial states; but these formed no barrier against the power of the court.

The clergy formed the first estate of the kingdom in point of precedence. They amounted to 130,000. The higher orders of them enjoyed immense revenues; but the *curés* or great body of acting clergy seldom possessed more than about 28l. sterling a-year, and their *vicaires* about half that sum. A few of their dignified clergy were men of great piety, who resided constantly in their dioceses, and attended to the duties of their office; but by far the greater number of them passed their lives at Paris and Versailles, immersed in all the intrigues and dissipation of a gay and corrupted court and capital. They were almost exclusively selected from among the younger branches of the families of the most powerful nobility, and accounted it a kind of dishonour to the order of bishops for any person of low rank to be admitted into it. The lower clergy, on the contrary, were persons of mean birth, and had little chance of preferment. At the same time, we find several respectable exceptions to this last rule. The clergy, as a body, independent of the tithes, possessed a revenue arising from their property in lands, amounting

French  
Revolution.

9  
The nobi-  
lity the se-  
cond.

to four or five millions sterling annually; at the same time they were exempt from taxation. The crown had of late years attempted to break through this privilege. To avoid the danger, the clergy presented to the court a free gift of a sum of money somewhat short of a million sterling every five years.

The nobility was nominally the second order of the state, but it was in reality the first. The nobles amounted to no less than 200,000 in number. The title and rank descended to all the children of the family, but the property to the eldest alone. Hence vast multitudes of them were dependent upon the bounty of the court. They regarded the useful and commercial arts as dishonourable, and even the liberal professions of the law and physic as in a great measure beneath their dignity, disdaining to intermarry with the families of their professors. The feudal system in its purity was extremely favourable to the production of respectable qualities in the minds of those who belonged to the order of the nobles; but the introduction of commerce has rendered its decline equally unfavourable to that class of men. Instead of the ancient patriarchal attachment between the feudal chieftain and his vassals, the nobility had become greedy landlords in the provinces, that they might appear in splendour at court and the capital. There, lost in intrigue, sensuality, and vanity, their characters became frivolous and contemptible. Such of the French noblesse, however, as remained in the provinces, regarded with indignation this degradation of their order, and still retained a proud sense of honour and of courage, which has always rendered them respectable. The order of the nobles was exempted from the payment of taxes, although the property of some of them was immense. The estates of the prince of Condé, for example, were worth 200,000*l.* a year, and those of the duke of Orleans, nearly twice as much. The crown had indeed imposed some trifling taxes upon the noblesse, which however, they in a great measure contrived to elude.

10  
The parlia-  
ment the  
third,

Next to the nobles, and as a privileged order possessing a secondary kind of nobility of their own, we may mention the parliaments. These were large bodies of men, in different provinces, appointed as courts of law for the administration of justice. In consequence of the corruption of the officers of state, the members purchased their places, which they held for life; but the son was usually preferred when he offered to purchase his father's place. In consequence of this last circumstance, the practising lawyers had little chance of ever becoming judges. Courts thus constituted consisted of a motley mixture of old and young, learned and ignorant, men. Justice was ill administered. The judges allowed their votes in depending causes to be openly solicited by the parties or their friends. No wise man ever entered into a litigation against a member of one of these parliaments; no lawyer would undertake to plead his cause; it never came to a successful issue, and usually never came to any issue at all. After the states-general had fallen into disuse, the parliaments acquired a certain degree of political consequence, and formed the only check upon the absolute power of the crown. The laws, or royal edicts, before being put in force, were always sent to be registered in the books of the parliaments. Taking advantage of this, in favourable times and circumstances, they often delayed or refused to register the royal edicts, and presented remonstrances

against them. This was done under a kind of legal fiction: for they pretended that the obnoxious edict being injurious to the public happiness, could not be the will of the king, but must either be a forgery or an imposition by the ministers. These objections were got the better of, either by a positive order from the king, or by his coming in person and ordering the edict to be registered. The parliaments, however, often carried their opposition very far, even to the ruin of themselves and their families as individuals. This rendered them extremely popular with the nation, and enabled them to embarrass a weak administration. After all, however, the opposition of the parliaments was so feeble, that it was never thought worth while to abolish them entirely till towards the end of the reign of Louis XV. but they were restored as a popular measure at the beginning of the reign of Louis XVI.

The *tiers état*, or commons, formed the lowest order of the state in France, and they were depressed and miserable in the extreme. To form a conception of their situation, it is necessary to observe that they bore the whole pecuniary burdens of the state: They alone were liable to taxation. An extensive and ambitious court; an army of 300,000 men in time of peace, and of twice that number in war; a considerable marine establishment, public roads and works, were all supported exclusively by the lowest of the people. To add to the evil, the revenues were ill collected. They were let out to farmers-general at a certain sum, over and above which they not only acquired immense fortunes to themselves, but were enabled to advance enormous presents to those favourites or mistresses of the king or the minister, by means of whom they procured their places. To raise all this money from the people, they were guilty of the cruellest oppression, having it in their power to obtain whatever revenue they pleased, and executing them in the severest manner. For this purpose they kept in pay an army of clerks, jobbers, scouts, and spies, amounting to 30,000 men. These men were indeed detested by the king, whom they deceived and kept in poverty; by the people, whom they oppressed; and by the ancient nobility, as a vile, sordid upstart. But the court of France could never contrive to manage without them. The parliaments could be called out by the intendants of the provinces in what they called *cortes* to stand upon the high roads for a certain number of days in the year, which was a source of severe oppression, as the intendant had the choice of the time and place of their employment, and was not bound to accept of any contribution in money. They were moreover subject to the nobles in a thousand ways. The nobles retained all their ancient manorial or patrimonial jurisdictions. The common people being anciently slaves, had obtained their freedom upon different conditions. In many places they and their posterity remained bound to pay a perpetual tribute to their feudal lords. Such tributes formed a considerable part of the revenue of many of the provincial nobles. No man could be an officer of the army, by a late regulation, who did not produce proofs of nobility for four generations. The parliaments, although originally of the *tiers état*, attempted also to introduce a rule that none but the noblesse should be admitted into their order. In such a situation, it will not be accounted surprising that the common people of France were extremely superstitious

**French Revolution.** tions and ignorant. They were however, passionately devoted to their monarch, and whatever concerned him. In 1754, when Louis XV. was taken ill at Metz, the whole nation was truly in a kind of despair. The courier and his horse that brought the news of his recovery to Paris were both almost suffocated by the embraces of the people.

**12** Despotic power of the king. We have said that the French monarch was despotic. His power was supported by his army and by a watchful police, having in pay an infinite host of spies and other servants. In France no man was safe. The secrets of private families were searched into. Nothing was unknown to the jealous inquisition of the police. Men were seized by *lettres de cachet* when they least expected it, and their families had no means of discovering their fate. The sentence of a court at law against a nobleman was usually reversed by the minister. No book was published without the license of a censor-general appointed by the court, and the minister was accountable to none but the king. No account was given of the expenditure of the public money. Enormous gratifications and pensions were given as the reward of the most infamous services. The supreme power of the state was usually lodged with a favourite mistress, and she was sometimes a woman taken from public prostitution. This was not indeed the case under Louis XVI. but it was nevertheless one of the misfortunes of his life that he was far from being absolute in his own family. Still however, with all its faults, the French court was the most splendid and polished in Europe. It was more the resort of men of talents and of every kind, and there they met with more instruction than anywhere else. The court was the centre of their productions, but they met with more attention from men of fortune and rank, and for a century past the French court was the law to Europe in all questions of literature, and of every polite accomplishment. The elegance that prevailed at court diffused itself through the nation; and amidst much internal corruption, the appearance of happiness and of luxury and vanity.

**13** Splendour of the court, &c. **14** Causes of the revolution. Such as it was, the government had stood for ages, and might have continued, had not a concurrence of causes contributed to its overthrow. The inferior orders of clergy, excluded from all chance of preferment, regarded their superiors with jealousy and envy, and were ready to join the laity of their own rank in any popular commotion. The inferior provincial noblesse beheld with contempt and indignation the vices and the power of the courtiers, and the higher nobility wished to diminish the power of the crown. The practising lawyers, almost entirely excluded from the chance of becoming judges, wished eagerly for a change of affairs, not doubting that their talents and professional skill would render them necessary amidst any alterations that could occur. Accordingly they were the first instruments in producing the revolution, and have been its most active supporters. The moneyed interest wished eagerly for the downfall of the ancient nobility. As for the great mass of the common people, they were too ignorant, too superstitiously attached to old establishments, and too much depressed, to have any conception of the nature of political liberty, or any hope of obtaining it. We have already stated the leading circum-

**French Revolution.** stances which led to the French revolution (see FRANCE, N° 184, &c.); but there were other circumstances which contributed in an equal degree both to its commencement and its progress.

For 40 years the principles of liberty had been disseminated with eagerness in France by some men of great talents, as Rousseau, Helvetius, and Raynal, to whom the celebrated Montesquieu had led the way. Besides these, there was in France a vast multitude of what were called *men of letters*, or persons who gave this account of the manner in which they spent their time. All these were deeply engaged on the side of some kind of political reform. The men of letters in Paris alone are said to have amounted to 20,000. One of the last acts of the administration of the archbishop of Thoulouse was, on the 5th July 1788, to publish a resolution of the king in council, inviting all his subjects to give him their advice with regard to the state of affairs. This was considered as a concession of an unlimited liberty of the press; and it is scarcely possible to form an idea of the infinite variety of political publications which from that period diffused among the people a dissatisfaction with the order of things in which they had hitherto lived.

The established religion of France had for some time past been gradually undermined. It had been solemnly assaulted by philosophers in various elaborate performances; and men of wit, among whom Voltaire took the lead, had attacked it with the dangerous weapon of ridicule. The Roman Catholic religion is much exposed in this respect, in consequence of the multitude of false miracles and legendary tales with which its history abounds. Without discriminating betwixt the respectable principles on which it rests, and the superstitious follies by which it has been defaced, the French nation learned to laugh at the whole, and rejected instead of reforming the religion of their fathers. Thus the first order in the state had already begun to be regarded as useless, and the minds of men were prepared for important changes.

The immense population of the city of Paris, amounting to upwards of 800,000 souls, rendered it an important engine in the hands of the conductors of the revolution. An overgrown capital has always proved dangerous to a government that is or attempts to be despotic, as appears from the history of ancient Babylon and Rome, as well as of modern Constantinople, of London under Charles I. and Paris under several of its kings.

We cannot avoid here mentioning a physical event, which assisted not a little in producing many of the convulsions attending the revolution, a general scarcity of grain, which occurred about that period. On Sunday the 13th of July 1788, about nine in the morning, without any eclipse, a dreadful darkness suddenly overspread several parts of France. It was the prelude of such a tempest as is unexampled in the temperate climates of Europe. Wind, rain, hail, and thunder seemed to contend in impetuosity; but the hail was the great instrument of ruin. Instead of the rich prospects of an early autumn, the face of nature in the space of an hour presented the dreary aspect of universal winter. The soil was converted into a morass, the standing corn beaten into a quagmire, the vines broken to pieces, the fruit trees demolished, and unmelted hail lying in heaps like rocks of solid ice. Even the robust

French Revolution, 1789. The assembly was thereafter opened by a short speech from the throne, in which the king congratulated himself upon thus meeting his people assembled; alluded to the national debt, and the taxes, which were severely felt because unequally levied: he took notice of the general discontent and spirit of innovation which prevailed, but declared his confidence in the wisdom of the assembly for remedying every evil. "May a happy union (added he) reign in this assembly; and may this epocha become ever memorable for the happiness and prosperity of the country. It is the wish of my heart; it is the most ardent desire of my prayers; it is, in short, the price which I expect from the sincerity of my intentions and my love for my people."

M. Barretin, the keeper of the seals, next addressed the assembly in a congratulatory and uninteresting speech. He was followed by the popular minister M. Neckar, who spoke for three hours. Though much applauded on account of the clear financial details which his speech contained, he encountered a certain degree of censure from all parties, on account of the cautious ambiguity which he observed with regard to the future proceedings of the states-general.

19  
Their debility and inactivity.

Next day the three orders assembled separately. The deputies of the *tiers état* amounted to 600 in number, and those of the nobles and clergy to 300 each. During their first sittings much time was spent in unimportant debates about trifling points of form; but the first important question, that necessarily became the subject of their discussion, was the verification of the powers, or production of the commissions of the deputies, and investigation of their authenticity. The *tiers état* held of this as a pretext for raising a controversy, whether the states-general should be in one or in three separate chambers? They refused to permit the nobles and the clergy to sit along with them in the common hall for the purpose of verifying their powers in one common assembly. On the 11th of the clergy 114 members voted for the continuance of this ceremony in the general assembly; and 133 against it. But in the more haughty order of the nobles, the resolution for the verification in their own assembly was carried by a majority of 188 against 47. The commons said no regard to this. They were conducted by bold and skillful leaders, who discerned the importance of the point in contest, and resolved not to abandon it. Aware of the exigencies of the state, they knew that the crown was nearly verging upon bankruptcy; and that such were the deficiencies of the revenue that only a short delay was necessary to accomplish the absolute dissolution of the government. They suffered five weeks to pass away therefore in total inactivity. During this period proposals were made on the part of the ministry for a pacification between the three orders, and conferences were opened by commissioners from each. But no art could seduce the commons from their original purpose, or prevail with them to enter upon the business of the state.

20  
Popularity of the *Tiers Etat*, or commons.

The nation had expected much from the assembling of the states-general, and learnt the news of their inaction with no small degree of concern. The *tiers état* was naturally popular, and the public censure could not readily devolve upon that favourite order. Moreover, from the first period of their assembling the commons made every effort to augment their own natural popu-

larity. They admitted all persons promiscuously into the galleries, and even into the body of their hall. No restraint was attempted to be laid upon the most vehement marks of popular applause or censure. Lists of the voters names were publicly taken and sent to Paris upon every remarkable occasion; and the members suddenly found themselves become, according to their political sentiments, the objects of general execration or applause. The new and bold notions of liberty that were daily advanced by the leaders of the *tiers état* were received with acclamation by their hearers. The capital became interested in the issue of every debate; and the political fervour was eagerly imbibed by the nation with that vivacity which is so peculiar to the French. The commons accused the nobles of obstinately impeding the business of the state, by refusing to verify their powers in one common assembly. The accusation was swallowed by the multitude, who saw not, or were unwilling to see, that the attack was made by their own favourite order. In the mean time the nobles became rapidly more and more unpopular. Their persons were insulted, new publications daily came forth, and were greedily bought up, which reviled their whole order, and represented them as an useless or pernicious body of men, whose existence ought not to be tolerated in a free state. Whoever adhered to them was branded with the odious appellation of *Arifocrate*. The clergy, from the influence of the parish *curés* or parsons, seemed ready to desert their cause. They were even opposed by a minority of their own body, which derived lustre from having at its head the duke of Orleans, the first prince of the blood. Still, however, the majority of the nobles remained firm; well aware, that if they once consented to sit in the same assembly, and to vote promiscuously, with the ambitious and more numerous body of the commons, their whole order, and all its splendid privileges, must speedily be overthrown.

21  
Taking advantage of this popularity, they seize the legislative authority; The leaders of the commons saw the change that was taking place in the minds of men; and they at length regarded the period as arrived when they ought to emerge from their inactivity, and execute the daring project of seizing the legislative authority in their country. They declared that the representatives of the nobles and the clergy were only the deputies of particular incorporations whom they would allow to sit and vote along with themselves; but who had no title in a collective capacity to act as the legislators of France. For conducting business with more facility, they appointed 20 committees. In consequence of a proposal by the Abbé Sieyès, a final message was sent to the privileged orders, requiring their attendance as individuals, and intimating that the commons, as the deputies of 96 out of every hundred of their countrymen, were about to assume the exclusive power of legislation. None of the nobles obeyed this summons; but three *curés*, Messrs Cefve, Ballard, and Jalot, presented their commissions, and were received with loud acclamations. They were next day followed by five more, among whom were Messrs Gregoire, Dillon, and Bodinau. After some debate concerning the appellation which they ought to assume, the commons, with such of the clergy as had joined them, solemnly voted themselves the sovereign legislators of their country under the name of the *National Assembly*. The result of the vote was no sooner declared, that the hall resounded

of the troops, offering to be responsible for the public peace, and to proceed in a body to Paris to encounter personally every danger that might occur. But they were coolly told, that the king was the best judge of the mode of employing the troops, and that the presence of the assembly was necessary at Versailles. From a sovereign who doubtless recollected the proceedings of the long parliament of England, a different reply could not in reason be expected. On receiving it, however, it was instantly decreed, on the motion of the marquis de la Fayette, that the late ministry had *carried with them the confidence of the assembly, that the troops ought to be removed; that the ministry are, and shall be responsible to the people for their conduct; that the assembly persisted in all its former decrees; and that as it had taken the public debt under the protection of the nation, no power in France was entitled to pronounce the infamous word bankruptcy.*

The city of Paris was thrown into deep consternation by the news of M. Neckar's retreat. His bust, and that of the duke d'Orleans were dressed in mourning, and carried through the streets. The royal Alлемand, a German regiment, broke in pieces the busts, and dispersed the populace. The prince De Lambescq, grand ecuyer of France, was ordered to advance with his regiment of cavalry, and take post at the Thuilleries. Being a man of a violent temper, and enraged by the appearances of disapprobation which were visible around him, he furiously cut down with his sword a poor old man who was walking peaceably in the gardens. The consequences of this act of inhumanity were such as might have been expected; a shout of execration instantly arose; the cry *to arms* was heard; the military were assaulted on all sides; the French guards joined their countrymen, and compelled the Germans, overpowered by numbers, and unsupported by the rest of the army, to retire.

All order was now at an end, and as night approached an universal terror diffused itself through the city. Bands of robbers were collecting; and from them or from the foreign soldiery a general pillage was expected. The night passed away in consternation and tumult. It was found in the morning that the hospital of St Lazare was already plundered. The alarm bells were rung; the citizens assembled at the Hotel de Ville, and adopted a proposal that was there made, of enrolling themselves as a militia for general defence, under the appellation of the *national guard*. This day and the succeeding night were spent in tolerable quietness, without any attempt on the part of the army. On the morning of the memorable 14th of July, it was discovered that the troops encamped in the Champs Elisees had moved off, and an immediate assault was expected. The national guard now amounted to 150,000 men; but they were in general destitute of arms. They had assumed a green cockade; but on recollecting that this was the livery of the count d'Artois, they adopted one of red, blue, and white. M. de la Salle was named commander in chief, officers were chosen, and detachments sent around in quest of arms. In the Hotel des Invalides upwards of 30,000 stand of arms were found, along with 20 pieces of cannon; a variety of weapons was also procured from the *garde meuble de la couronne*, and from the shops of armourers, cutlers, &c.

The celebrated fortress of the Bastille was an object

of much jealousy to the Parisians. At 11 o'clock in the morning, M. de la Rosiere, at the head of a numerous deputation, waited upon M. de Launay the governor, who promised, along with the officers of his garrison, that they would not fire upon the city unless they should be attacked. But a report was soon spread through Paris, that M. de Launay had, in a short time; thereafter, admitted into the fortress a multitude of persons, and then treacherously massacred them. The cause of this piece of perfidy has never been explained. The fact itself has been denied; but it was attested at the time by the duke of Dorset, the British ambassador at the court of France. The effect of the report was, that a sudden resolution was adopted of assaulting the Bastille; an immense and furious multitude rushed into its outer, and soon forced their way into its inner courts, where they received and returned a severe fire for the space of an hour. The French guards, who were now embodied into the national guard, conducted the attack with skill and coolness: they dragged three waggons loaded with straw to the foot of the walls, and there set them on fire; the smoke of these broke the aim of the garrison, while it gave no disturbance to the more distant assailants. The besieging multitude pressed the attack with incredible obstinacy and vigour for the space of four hours; the garrison was in confusion; the officers forced the cannon in person, and fired their muskets in the ranks; the governor, in despair, thrice attempted to blow up the fortress. A capitulation, when at last fought, was refused to the garrison, and an unconditional surrender was demanded. The governor, and M. de Lofne, Salomon, a French gentleman of distinguished humanity and integrity, became victims of popular fury in spite of every effort that could be made for their protection. On the 15th the guards succeeded in procuring the surrender of the fortress. Only seven prisoners were found in the fortress. A guard was placed in it, and the keys were given to the celebrated M. Brissot de Warville, who had previously had inhabited one of its towers.

The remaining part of the day was spent at Paris in a mixture of terror and alarm. In the pocket of the governor of the fortress, a letter was found encouraging him to resist to the last, and to expect success; signed by M. de Launay, the governor, the merchants, and the citizens of the city. This piece of treachery was discovered by a French officer; and his bloody head was carried through the city on a pole, along with that of M. de Launay. At the approach of night a body of troops advanced towards the city, at the Barriere d'Enfer. The new national guard hurried thither, preceded by a train of artillery, and the troops withdrew upon the first fire: barricades were everywhere formed, the alarm bells were rung, and a general illumination continued during the whole of this night of confusion.

In the mean time, it was obvious that the new ministry were entering upon a difficult scene of action, where one false step might lead to ruin, and where their own plan of conduct ought to be maturely digested. Marshal Broglie was made minister of war, the baron de Breteuil president of finance, M. de la Galaziere comptroller-general, M. de la Porte intendant of the war department, and M. Foulon intendant of the navy;

nisty ap-  
pointed.

The whole of the late ministry escaped excepting M. Foulon.

French Revolution, 1789.

46

Fate of M. Poulon, one of the late ministry, and his son-in-law Berthier.

His character, it may well be imagined, was extremely unpopular; for he is said to have asserted, that he would "make the people of Paris eat hay." He had retired to the country, but was seized by his own vassals, and brought to Paris with a bundle of hay tied to his back. In spite of every effort made by Mr. M. Bailly and Fayette to procure him a fair trial at least, he was carried to the *Place de Grève*, and hanged at a lamp-post by the enraged multitude. His son-in-law M. Berthier, attempting to defend himself against a similar fate, fell, covered with wounds. These events were carried round on poles; and thus the people became habituated to the sight of blood and murder: they were even taught by popular songs to glorify in such actions, and particularly by the well-known song *Cu-ira*.

47  
M. Neckar returns, and the immediate consequences of it.

48

In consequence of an invitation from the King, M. Neckar returned to France. He was received by the assembly with great applause, and in Paris with still more solemnity and triumph. He here, however, committed a political error that made some noise. In denouncing the late excesses and murders, and taking notice of the arrest of M. Bezenval, an officer of the Swiss guards, he requested of the electors at the Hotel de Ville, in a solemn harangue, that the past should be forgotten; that proscriptions should cease, and a general amnesty be proclaimed. In a moment of enthusiasm this was agreed to, and the electors decreed what unquestionably exceeded their powers. The districts of Paris were instantly in commotion; the electors alarmed, declared that they only meant that "henceforth the people would punish no man but according to law;" and, at the same time, to prove that they themselves were free from ambition, they formally renounced all their own powers. The assembly took up the question. Mess. Lally, Tolendal, Mounier, Clermont Tonnerre, Garat junior, and others, declared that no person ought to be arrested without a formal accusation: While Mess. Mirabeau, Robespierre, Barnave, and Gleizen, alleged on the contrary, that the people were entitled to lay hold of any man who had publicly appeared at the head of their enemies. The debate ended, by admitting the explanation of the doctors, and by a declaration that it was the duty of the assembly to see justice executed in all cases.

48  
The commo-  
tions,  
&c. of the  
capital  
reach to the  
provinces.

ably to see justice executed in all cases.

The commotions and enthusiasm of the capital were speedily communicated to the provinces. In every quarter the people seized upon all the arms that could be found, and the military uniformly refused to act against them. Many acts of outrage were committed in Brittany, at Strasburg, and the Lyonnais, and elsewhere, in which the nobility were the sufferers. The mischiefs that occurred were usually magnified at a distance; but that very circumstance was an additional evil. For example: It was stated in the National Assembly that M. de Mesmay, lord of Quintin, invited a number of patriots, among whom were the officers of a neighbouring garrison, to a splendid entertainment at his house to celebrate the happy union of the three orders: That in the midst of the feast he makes of the house contrived to withdraw unnoticed, and to set fire to a train previously laid which communicated with a quantity of gunpowder in the cellars, in consequence of which the whole company, by a sudden explosion, were blown into the air. It was found upon inquiry.

that there was not one word of truth in the whole story. But before this inquiry could be made, all France had resounded with accounts of the pretended bloody tragedy; and the whole nobility of the kingdom suffered in a less or greater degree, from the prejudices excited by this unhappy report, the origin of which has never been well explained. It would be vain to state all the idle rumours to which at this time the blind credulity of the multitude gave currency. At one time the aristocrats were cutting down the green corn, at another time they were burying flour in common sewers, and sending leaves into the Seine. One report was no sooner proved to be false than another arose, and the whole nation was agitated by suspicion and alarm. The National Assembly were engaged in framing their celebrated declaration of the rights of man, which was to form the basis of the new constitution, when the alarming accounts, received from all quarters, of the state of anarchy into which the kingdom was falling, obliged them suddenly to turn their attention to objects of practical necessity. The privileged orders found themselves become the objects of universal jealousy and hatred; and that something must be done to save their families and property, which were in danger on every side with popular violence, they began signalling the popular tumults as their greatest enemies. To save something they resolved to sacrifice a portion of their

On the afternoon of the 17th of August, the Viscount de vicount de Noailles, seconded by the Duke of Angoulême, opened out of the most important laws of the French Revolution, or in the history of the Revolution. These noblemen stated, that the true aim of the Revolution was the welfare of the people, who growed weary of the oppression of public contributions and of the

Are carried prisoners to Paris.

set out at two o'clock a prisoner in the custody of the mob. Two gentlemen were selected from his body-guard, and, with all the parade of an execution, beheaded in the court of his palace. Their heads were stuck upon spears, and led the procession; whilst the royal captives who followed in the train, and beheld this spectacle, were conducted so slowly, that a short journey of twelve miles was protracted to six hours. The king, the queen, and their children, were lodged in the old palace of the Louvre, whilst monarchs went to reside at the Luxembourg. The day was terminated, and the evening spent in triumph by the French.

68  
Triumph of the popular party.

The removal of the king to Paris was a triumph by the popular party. The nobles considered it as completely ruining their hopes; and even many men of talents, such as Mirabeau and Lally Tollendal, whom we cannot regard as friends to the popular cause in its efforts, regarded every prospect of attaining a happy constitutional freedom as at an end, as the national representation must be for ever exposed to the insults, and overawed by the influence, of a turbulent capital. Many members of the assembly took refuge in foreign countries, and used every effort to excite the other nations of Europe to hostility against France. As the duke of Orleans had been regarded as a chief agent in promoting the late disturbances, the marquis de la Fayette waited upon him, and insisted upon his leaving the kingdom for a time. The duke was overawed, and, on pretence of public business, went to England, where he remained for several months.

69  
The assembly holds its first session at Paris.

On the 19th of October, the national assembly held its first session in Paris. The king was closely guarded in his own palace; and no apparent opposition now stood in the way to prevent the popular party from giving to their country such a constitution as they might judge expedient. Much, however, was yet to be done, and many difficulties remained, resulting from the habits of men educated under a very different order of things. Two days after the assembly came to Paris, a baker was publicly executed by the mob, upon a false accusation of having concealed a quantity of bread. While the assembly was at a distance, events of this nature had been little attended to, and the leading party avoided attempting to check these ebullitions of popular violence, from which they had derived so much advantage; but that party was now all-powerful, and to grant an offence committed against the law was regarded as an insult upon the sovereignty of the national assembly. Two leaders of the mob were therefore tried and publicly executed, and a severe law was passed, of the nature of the British riot act, authorizing the magistrates to act by military force against any multitude of persons that should refuse to disperse, and the peace of the capital was secured for several months; but in the country at large, no small degree of anxiety and trouble still subsisted. The same suspicious temper which had prevailed at Paris, agitated the provinces with the dread of plots and monopolies of grain. Add to this, that the nobles in the country were by no means satisfied with the liberality with which their representatives had on the 4th of August, voted away their privileges and their property. This produced violent jealousies between the peasants and their lords,

and gradually conveyed to every corner of the kingdom the political ferment which had commenced at Paris. French Revolution, 1789.

The national assembly being now, however, in tolerable security, proceeded in the arduous attempt of forming a free constitution for the great empire of France. The abbé Sieyès presented a plan for dividing the kingdom into 83 departments, of about 324 square leagues, and of each department into several districts, and each district was subdivided into cantons of four square leagues in extent. Thus the whole of the ancient divisions of the kingdom into governments, generalities, and bailiwicks, was in an instant obliterated. An attempt was also made to simplify in an equal degree the relative situation of individuals in civil life, by a decree which put an end to all distinction of rank and immunities, so far as any privilege whatever was concerned. At the same time, a bold and most important measure was adopted, which has since proved the origin of those terrible efforts which France has been enabled to make against the rest of Europe. This was the confiscation of the whole of the lands belonging to the church, for the purpose of supplying the exigencies of the state. In this confiscation, all regard to justice was thrown aside. The lands of the church were as certainly the property of the church as the property of him who occupies it. The state may have had a right to appropriate to itself the church lands upon the death of the incumbents; but it might with equal justice, and perhaps greater propriety, have seized the enormous revenues of the dukes of Orleans, as have confiscated a single acre belonging to the most just and virtuous of his own consent. This nefarious measure was proposed by the bishop of Autun, M. Talleyrand, a man of no religion, who had been promoted to the bench in a most irregular manner, for no other purpose. The mode in which the measure was carried into effect was by issuing assignments to the owners, which assignments were to be received by the owners, the payment of taxes, or for the redemption of the lands when set up for sale. The assignments were all the same time made for the redemption of the lands for the future to be paid by the state, and the state was to be repaid by the sale of the lands. A decree was passed that the property of the church in the kingdom was to be sold for the redemption of the church lands.

Nothing remarkable now occurred for some time. The Assembly proceeded to organize the kingdom by the establishment of municipalities, and by reforming the jurisprudence of the country. It is to be observed, however, that when the parliament of Paris was abolished,

lished, the Chatelet, being the second court in that city, was retained for the purpose of trying those persons who had become most obnoxious by their attachment to the royal cause. This court had the spirit to acquit the Baron de Bezenval, Marshal Broglie, and the Prince de Lambesq. But having incurred much popular odium on this account, they were guilty of the unworthy meanness of condemning to death the Marquis de Favres, for a pretended conspiracy (of which no tolerable proof was ever brought) to massacre La Fayette, Bailly, and Neckar, and to convey the king to Peronne.

1790.

During the whole of this winter the king had been very strictly watched by numerous guards placed about his palace, inasmuch that the other nations of Europe considered him as in a state of captivity. To remove this impression, if possible, and to make it appear as if a voluntary agent in the measures that had lately been adopted, was now regarded as a matter of some importance. Every effort was therefore made to prevail with him to come to the assembly suddenly, and as it were, of his own voluntary choice, there to declare his adherence to the measures which had lately been adopted. For some time he resisted this proposal; but at length, on the 20th of February, he did suddenly appear before the national assembly, where he complained of the attempts that had been made to shake the new constitution. He declared his wish "that it should be universally known that the monarch and the representatives of the nation were united, and their wishes were the same; that he would defend the constitution of the state; that, in conjunction with the nation, he would carry into effect the sentiments of his heart; that he was a man of things which the circumstances of the moment had introduced." This declaration was received with great applause, and in no small degree, and it was the tendency of looking for aid from the nation, which they had always been too

71

the  
the  
and their  
lands con-  
fiscated.

the 14th of February, monastic establishments were suppressed, and their lands confiscated; but the prelates and monks were not persons for their lands to be confiscated. The national assembly, however, it is easily seen, was not the only body that was in existence at this time. The Committee began to assemble in the *Club*, from the hall belonging to the Jacobins in Paris, in which their meetings were held.

March

15th.

75  
The Red  
Book, or  
List of pen-  
sions and  
donations,  
published.

An event occurred at this time which tended in no small degree to increase the odium under which the old government already laboured. This was the publication of the *Red Book*, or list of pensions and donations granted by the crown. In consequence of the most pressing instances, it had been communicated by M. Neckar to a committee of the assembly, after many entreaties, and the most solemn promises of secrecy. It afforded, however, too striking an advantage to the popular party not to be made use of, and in a few days M. Neckar, to his no small surprise, saw this register publicly sold by every bookseller in Paris. He ought not, indeed, to have been surprised; and the giving up of this list is one of the many proofs which the transactions of that period afford of his great unsuitness for the office which he held. With much indignation, however, he de-

manded why the committee had published it without the permission of the assembly or the king? But he was told by the committee, that "as to the assembly, they were sure of its approbation; and as to the king, they were not his representatives." To give an idea of the effect of this publication, it is only necessary to remark, that, under the last administration of M. Calonne, the two brothers of the king had received from the public treasury, independent of their legitimate income, nearly two millions sterling; and that 600,000. l. was granted to an individual, because he was the son of M. de Polignac. M. Neckar's opposition to the publication tended in no small degree to shake his popularity, and the rest of the ministry began to lose the confidence of the public. Indeed, at this time, the causes of alarm prevailed on all sides. The clergy were attempting to revive in the provinces the ancient animosities between the Roman Catholics and the Protestants, ascribing the late decrees of the assembly to the latter. The German princes who possessed property in the north of France were complaining loudly of the violation of their rights by the abolition of the feudal system, although the national assembly had voted to them a compensation. The most melancholy intelligence was received from their colonies in the West Indies. In regulating these, the assembly had not recognized the right of the free negroes to enjoy the same privileges with other citizens; at the same time, they did not go the length of denying these privileges. This uncertain conduct produced infinite calamities. The whites contended with those commonly called *people of colour*. These again sometimes stood in opposition to the free negroes or to the slaves; and hence it sometimes happened that no less than three hostile assemblies were held at the same time in the same colony, which made war upon each other with the most inveterate fury. Each party found protectors in the national assembly of the parent state. Those who favoured or opposed the existence of distinctions at home, in general followed out the same principle with regard to the colonies.

78

On the 14th of May, M. de Montmorency communicated to the national assembly the preparations for war in which England and Spain were engaged. This brought forward the constitutional question, "Who ought to possess the power of declaring peace and war?" The Count Clermont Tonnerre, Messrs de Serent, Vigner, and Dupont, supported the royal prerogative; while on the other side, the exclusive right of the legislative body to exercise this important prerogative was supported by Messrs d'Aiguillon, Garat jun. Freteau, Jellot, Charles Lameth, Sillery, Petion, Robespierre, &c. M. Petion proposed a decree "that the French nation renounced for ever all idea of conquest, and consented itself entirely to defensive war;" which was passed with universal acclamation. The Count de Mirabeau attempted to propose that peace and war should be declared by the king and the legislative body in conjunction; and the decree that was passed on the subject is a strange *farago* of contradictions and absurdities. It enjoined the king to "guard the state from external attacks." But how could this be done, without repelling any attack that might be made upon it? This, however, he could not do, without previously informing the national assembly; and if that body chanced

with a death's head, surrounded by a laurel wreath on one cuff, and a sword on the other; with the motto "Conquer or die." The king was also surrounded by crowds of nonjuring priests and other disaffected persons. Thus, that popular jealousy which in every period of the revolution has strikingly marked the French character was kept on the alarm. On the 18th of April, therefore, when the royal family was preparing to go to St Cloud to pass some days, a report instantly spread that the king was about to fly from the country. The carriages were immediately surrounded by people. La Fayette drew out the national guard, but they refused to act. "We know," said they, "that we are violating the law, but the safety of our country is the first law." The king instantly went to the assembly, and with much spirit complained of the insult. He was answered respectfully by the president, and continued his journey. At the royal family had enjoyed a considerable degree of freedom for some time past, which was demonstrated by the unsuccessful opposition made to this journey—the present opportunity was embraced for intimating to foreign courts his acceptance of the constitution; and all obnoxious persons were dismissed from about his person. The breach of discipline on the part of the national guard on this occasion was so much resented by La Fayette, that he resigned his command. Paris was thrown into consternation; and it was not till after the most universal solicitation that he was prevailed upon to resume his office.

91  
Behaviour  
of Bouillé  
on the  
frontiers.

About this time M. de Bouillé, to whom the protection of the frontiers was intrusted, was employing, as it is now said, every means in his power to render the country defenceless. The garrisons were left unprovided; disunion was spread among the national troops; they were removed from the frontiers, and their place was occupied by foreigners, wherever it could be done. The emigrants abroad, and their friends at home, were lying in wait for an opportunity of revolt;—when suddenly, on the 21st of June, it was announced from the Tuilleries, that the king, the queen, the dauphin, with monsieur and madame, had quitted the palace and the capital, without leaving any information of their intention or their route. The emotion excited by this news among the multitude was a mixture of consternation and rage. The national assembly, however, acted with much coolness. They instantly took upon themselves the government, and decreed their flight permanent. They sent messengers, at the same time, in all directions, to attempt to lay hold of the fugitives. These had taken different routes. Monsieur and madame arrived safely at Brussels on the 3d. The king, queen, and their children, when they came to a considerable distance from the capital, were furnished by Bouillé with a guard of dragoons, under pretence of protecting treasure for the pay of the troops. At the distance of 156 miles, and when only a few leagues from the frontiers, they were arrested at St Mencheould by the postmaster, M. Drouet, formerly a dragoon in the regiment of Condé. At half past seven o'clock in the evening the carriages stopped to change horses at his house; he thought he recollected the queen, and imagined that the king's fate resembled the impressions stamped upon assignats. The escort of dragoons increased the suspicion. He suffered them to depart at

11 o'clock without notice; but taking a companion with him, he went by a shorter road to Varennes. With the assistance of the postmaster there he gave the alarm, and overturned a carriage on the bridge, which detained the royal travellers till the national guard of the place had assembled, and the arrest was effected without bloodshed. They were brought back to Paris by a deputation from the assembly. At his departure, the king had imprudently left behind him a memorial, in which he declared, that he never had thought any sacrifice too great for the restoration of order; but that the destruction of the kingdom, and the triumph of anarchy, being the only reward of all his efforts, he thought it necessary to depart from it. He then takes a review of the faults of the new constitution, the grievances he has suffered; and protests against every thing that he had been compelled to do during his captivity.

French  
Revolution,  
1791.

94  
The king  
and queen  
arrested at  
Varennes.

Different parties were very differently affected by this ill-conducted and unfortunate flight of the king. A small republican party had already begun to appear, and during the king's absence, attempts were made to induce the public at large to consider the royal authority as no necessary part of a free constitution. But the minds of men were by no means prepared for the reception of this new doctrine. The idea, however, having been thus publicly proposed, left some impressions, which in time contributed to give rise to important events. By far the greater number of leading men, however, were at present convinced, that it was impossible to conduct a great empire like France, well and prosperously without the assistance of a hereditary chief. They therefore determined to pass over the affair with as much silence as possible, and to hasten the period when their new constitution should be completed. But there is reason to believe that this journey, and the long-run highly instrumental in producing very fatal effects to the personal safety of the monarch.

95  
Conse-  
quences of this  
unfortunate  
flight.

His flight seemed a signal for emigration. Many of the aristocratic party sent in resignations of their seats in the national assembly. Troops were levied on the frontiers in the king's name; who took care, however, to disavow any connection with such a procedure. Bouillé emigrated, and afterwards sent to the assembly a furious threatening letter: "You shall answer (says he) for the lives of the king and of the queen to all the monarchs of the earth. Touch but a single hair of their heads, and not one stone shall be left upon another in Paris. I know the roads. I will conduct the foreign armies. This letter is but the forerunner of the manifesto of the sovereigns in Europe."

A considerable calm throughout France followed these events, and it might be regarded as in a state of tranquillity. It contained, indeed, parties entertaining much animosity against each other, and many citizens had withdrawn to foreign countries; but the peace was not broken, and moderate men hoped that much prosperity would follow from the late agitations. But this calm was delusive; and in the midst of it those projects were formed which were afterwards to prove so fatal to the peace of France and of Europe. Towards the close of this summer, a convention took place at Pillnitz in Saxony between the emperor Leopold and the king of Prussia. Its object was not known at that time, but it gradually came into view, and is now by many under-

96  
Treaty of  
Pillnitz.

French  
Revolution,  
1791.

stood to have been intended for the purpose of concluding a league for the invasion of France, the new-modelling of its government, and the partition of some of its fair-est provinces. The following paper has been repeatedly published as the copy of a treaty concluded and signed at Pavia, and is generally understood to have been identical with, and therefore known by, the name of the *Treaty of Pavia*. We are far from vouching for its authenticity. It may have been fabricated by the French assembly, to unite all parties in the nation against the foreign powers which threatened to invade them. But in stating the events of this revolution, it is perhaps still more necessary, for the purpose of rendering the actions of men comprehensible, to give an account of what was at the time believed to have occurred, than it now is to ascertain what was actually done.

*Partition Treaty between the Courts of Vienna, and signed at Pavia, in the Month of July, 1791.*

His majesty the emperor will take all the Low Countries, conquered in the Austrian Netherlands, and give them to his serene highness the elector of Prussia; so that these new possessions, added to the Palatinates, may hereafter have the name of *Prussia*.

His majesty will preserve far over the property and possession of the archduchess Maria Christina, put into hereditary possession of the duchy of Lorraine.

His serene highness the archduchess Maria Christina shall be, conjointly with his serene highness her nephew the archduke Charles, put into hereditary possession of the duchy of Lorraine.

The emperor shall be referred to the empire, and the bishop of Bamberg, as well as the chapter, shall recover their ancient privileges, and the ecclesiastical sovereigns of Germany shall do the same.

The Swiss cantons consent to accede to the coalition, it may be proposed to them to assist to the Helvetic League, the bishopric of Paderborn, the dukes of Brunswick, and even those of Tyrol, with the neighbouring princes, as well as the territory of Verden, which belongs to the king of Prussia.

Should his majesty the king of Sardinia subscribe to the coalition, La Brera, La Buzery, and the Pays de Gex, usurped by France from Savoy, shall be returned to him.

In case his Sardinian majesty was unable to give satisfaction, he shall be allowed to take possession of the same to him for ever as the sacred inheritance of the royal dauphins.

His majesty the king of Spain shall have Catalonia and Bearn, with the island of Corsica, and he shall have the French part of the island of St Domingo.

Her majesty the empress of all the Russias shall take upon herself the invasion of Poland, and at the same time retain Kamieniech, with that part of Podolia which borders on Moldavia.

His majesty the emperor shall oblige the Porte to give up Chocsim, as well as the small forts of Servia, and those on the river Lurna.

His majesty the king of Prussia, by means of the above-mentioned invasion of the empress of all the Russias in Poland, shall make an acquisition of Thorn and Dantzic, and there unite the palatinate on the east to the confines of Silesia.

VOL. XVI. Part I.

French  
Revolution,  
1791.

His majesty the king of Prussia shall besides acquire Lulace; and his serene highness the elector of Saxony shall in exchange receive the rest of Poland, and occupy the throne as hereditary sovereign.

His majesty the present king of Poland shall abdicate the throne on receiving a suitable annuity.

His royal highness the elector of Saxony shall give his daughter in marriage to his serene highness the prince of Prussia, the grand duke of Lithuania, and be the father of the race of the electors of Saxony and Lithuania. (Signed) *COURT FLORIDA BLAN-*

The national assembly was hastened to the completion of the new constitution. It was finished on the 24th of September, and presented to the king on the 25th. It begins with the following declaration of rights: "We, the people, do hereby declare that men are born, and remain, free and equal in rights; social distinctions cannot be founded but on common utility. II. The end of all political associations is the preservation of the natural and imprescriptible rights of man: these rights are liberty, property, security, and resistance against oppression. III. The principle of sovereignty resides essentially in the nation: no body of men, no individual, can exercise an authority that does not emanate expressly from that source. IV. Liberty, consists in the power of doing every thing except that which is hurtful to another: hence the exercise of the natural rights of every man has no other bounds than those that are necessary to ensure to the other members of society the enjoyment of the same rights: those bounds can be determined by the law only. V. The law has a right to forbid those actions alone that are hurtful to society. Whatever is not forbidden by the law, cannot be hindered; and no person can be constrained to do that which the law ordaineth not. VI. The law is the expression of the general will: all the citizens have a right to concur personally, or by their representatives, to the formation of the law: it ought to be the same for all, whether it protect, or whether it punish. All citizens being equal in the eye of the law, are equally admissible to dignities, places, and public offices, according to their capacity; and without any other distinction but that of their virtue and their talents. VII. No man can be accused, arrested, or detained, except in cases determined by the law, and according to the forms which the law hath prescribed. Those who neglect, despise, execute, or cause to be executed, arbitrary orders, ought to be punished; but every citizen that is summoned or seized in virtue of the law, ought to obey instantly—he becomes culpable by resistance. VIII. The law ought to establish such punishments only as are strictly and evidently necessary; and no person can be punished but in virtue of a law established and promulgated prior to the offence, and legally applied. IX. Every man being presumed innocent till such time

97

sembly.

Y

time

French  
Revolution,  
1791.

time as he has been declared guilty, if it shall be deemed absolutely necessary to arrest a man, every kind of rigour employed, not necessary to secure his person, ought to be severely repressed by the law.

X. No person shall be molested for his opinions, even such as are religious, provided that the manifestation of those opinions does not disturb the public order, established by the law.

XI. The free communication of thought, and of opinion, is one of the most precious rights of man. Every citizen, therefore, may freely speak, write, and publish, his sentiments; subject, however, to answer for the abuse of that liberty, in cases determined by the law.

XII. The guarantee of the Rights of Man and Citizens, involves a necessity of *public force*: this force is then instituted for the advantage of all, and not for the particular utility of those to whom it is confided.

XIII. For the maintenance of public force, and for the expences of administration, a common contribution is indispensably necessary: this contribution should be equally divided amongst all the citizens, in proportion to their abilities.

XIV. Every citizen has a right, by himself, or by his representatives, to decide concerning the necessity of the public contribution; to consent to it freely; to look after the employment of it; to determine the quantity, the distribution, the collection, and duration.

XV. The society has a right to demand from every public agent an account of his administration.

XVI. Every society, in which the guarantee of rights is not assured, nor the separation of powers determined, has no constitution.

XVII. Property being a right inviolable and sacred, no person can be deprived of it, except when the public necessity, legally ascertained, shall evidently require it, and on condition of a just and previous indemnification.

The constitution guarantees, as natural and civil rights,

1. That all citizens are admissible to places and employments without any distinction, but that of ability and virtue.

2. That all contributions shall be divided equally among all the citizens, in proportion to their means.

3. That the same crimes shall be subject to the same punishments, without any distinction of persons.

The constitution in like manner guarantees, as natural and civil rights,

Liberty to all men of going, staying, or departing, without being arrested, or detained, but according to the forms prescribed by the constitution.

Liberty to all men of speaking, writing, printing, and "publishing their thoughts, without having their writings subjected to any examination or inspection before publication;" and of exercising the religious worship to which they are attached.

Liberty to all citizens of assembling peaceably, and without arms, complying with the laws of police.

Liberty of addressing to all constitutional authorities petitions individually signed.

The constitution guarantees the inviolability of property, or a just and previous indemnity for that of which public necessity, legally proved, shall require the sacrifice.

French  
Revolution,  
1791.

A public instruction shall be created and organized, common to all citizens, gratuitous with regard to those parts of tuition indispensable for all men, and of which the establishment shall be gradually distributed in a proportion combined with the division of the kingdom.

"The kingdom is one and indivisible;" its territory, for administration, is distributed into 83 departments, each department into districts, each district into cantons.

Those are French citizens,

Who are born in France, of a French father;

Who having been born in France of a foreign father, have fixed their residence in the kingdom;

Who having been born in a foreign country, of a French father, have returned to settle in France, and have taken the civic oath;

In fine, who having been born in a foreign country, being descended in whatever degree from a Frenchman or a Frenchwoman, who have left their country from religious motives, come to reside in France, and take the civic oath.

The right of French citizenship is lost,

1st, By naturalization in a foreign country;

2dly, By being condemned to penalties which involve the civic degradation, provided the person condemned be not reinstated;

3dly, By a sentence of contumacy, provided the sentence be not annulled;

4thly, By initiation into any foreign order or body which supposes either proofs of nobility "or distinctions of birth, or requires religious vows."

"The law considers marriage only as a civil contract."

The sovereignty is one, indivisible, "inalienable, and imprescriptible," and it belongs to the nation: no portion of the people, or individual, can arrogate the exercise of it.

The nation, from which alone flow all powers, cannot exercise them but by delegation.

The French constitution is representative: the representatives are the legislative body and the king.

The national assembly, forming the legislative body, is permanent, and consists of one chamber only.

It shall be formed by new elections, every two years.

The legislative body cannot be dissolved by the king.

The number of representatives to the legislative body shall be 745, on account of the 83 departments of which the kingdom is composed; and independent of those that may be granted to the colonies.

The representatives shall be distributed among the 83 departments, according to the three proportions of land, of population, and the contribution direct.

Of the 745 representatives 247 are attached to the land. Of these each department shall nominate three, except the department of Paris, which shall nominate only one.

Two hundred and forty-nine representatives are attached to the population. The total mass of the active population of the kingdom is divided into 249 parts, and each department nominates as many of the deputies as it contains parts of the population.

Two hundred and forty-nine representatives are attached to the contribution direct. The sum total of the direct contribution of the kingdom is likewise divided into 249 parts; and each department nominates as many deputies as it pays parts of the contribution.

French Revolution, 1791. In order to form a legislative national assembly, the active citizens shall convene, in primary assemblies, every two years in the cities and cantons.

"The primary assemblies shall meet of full right on the first Sunday of March, if not convoked sooner by the public officers appointed to do so by the law."

To be an active citizen, it is necessary,

To be a Frenchman, or to have become a Frenchman ;

To have attained 25 years complete ;

To have resided in the city or the canton from the time determined by the law ;

To pay in any part of the kingdom a direct contribution, at least equal to the value of three days labour, and to produce the acquittance ;

Not to be in a menial capacity, namely, that of a servant receiving wages ;

To be inscribed in the municipality of the place of his residence in the list of the national guards ;

To have taken the civic oath.

The primary assemblies shall name electors in the proportion of the number of active citizens residing in the city or canton.

There shall be named one elector to the assembly, or not, according as there shall happen to be present 100 active citizens.

There shall be named two, when there shall be present from 101 to 250, and so on in this proportion.

The electors named in each department shall convene, in order to choose the number of representatives, whose nomination shall belong to their department, and a number of substitutes equal to the third of the representatives.

The assemblies shall be held of full right on the first Sunday of March, if they have not been before convoked by the public officers appointed to do so by the law.

All active citizens, whatever be their state, profession or occupation, may be chosen representatives of the nation.

Excepting, nevertheless, the ministers and other agents of the executive power, &c.

The members of the legislative body may be re-elected to a subsequent legislature, but not till after an interval of one legislature.

No active citizen can enter on his duties as an assembly if he is armed.

The representatives shall meet on the first Monday of May, in the place of the meeting of the legislative body.

The royalty is indivisible, and delegated sovereignty is to the race on the throne from male to male, by order of primogeniture, to the perpetual exclusion of women and their descendants.

Nothing is prejudged on the effect of renunciations in the race on the throne.

The person of the king is inviolable and sacred ; his only title is king of the French.

If the king put himself at the head of an army, and direct the forces of it against the nation, or if he do not oppose, by a formal act, any such enterprise undertaken in his name, he shall be held to have abdicated.

If the king having gone out of the kingdom, do not return to it, after an invitation by the legislative body, within the space which shall be fixed by the pro-

clamation, "and which cannot be less than two months," he shall be held to have abdicated the royalty.

After abdication, express or legal, the king shall be in the class of citizens, and may be accused and tried like them, for acts posterior to his abdication.

The nation makes provision for the splendour of the throne, by a civil list, of which the legislative body shall fix the sum at the commencement of each reign, for the whole duration of that reign.

The king is a minor till the age of 18 complete ; and during his minority there shall be a regent of the kingdom.

The regency belongs to the relation of the king next in degree, according to the order of succession to the throne, who has attained the age of 25 ; provided he be a Frenchman resident in the kingdom, and not presumptive heir to any other crown, and have previously taken the civic oath.

The presumptive heir shall bear the name of *Prince Regent*.

"The members of the king's family called to the eventual succession of the throne, shall add the denomination of *French Prince* to the name which shall be given them in the civil act proving their birth ; and this name can neither be patronymic nor formed of any of the qualifications abolished by the present constitution."

"The denomination of *prince* cannot be given to any individual, and shall not carry with it any privilege or exception to the common right of all French citizens."

To the king alone belongs the choice and dismissal of ministers.

"The members of the present national assembly, and of the subsequent legislatures, the members of the tribunal of appeal, and those who shall be of the high jury, cannot be advanced to the ministry, cannot receive any place, gift, pension, allowance, or commission of the executive power or its agents during the continuance of their functions, or during two years after ceasing to exercise them ; the same shall be observed respecting those who shall only be inscribed on the list of high jurors as long as their inscription shall continue."

No order of the king can be executed if it be not signed by him, and countersigned by the minister or comptroller of the department.

In no case can the written or verbal order of a king shelter a minister from responsibility.

The constitution delegates exclusively to the legislative body the powers and functions following :

To propose and decree laws—The king can only invite the legislative body to take an object into consideration ;

To fix the public expences ;

To establish the public contributions, to determine the nature of them, the amount of each sort, the duration, and the mode of collection, &c.

War cannot be resolved on but by a decree of the national assembly, passed on the formal and necessary proposition of the king, and sanctioned by him.

During the whole course of war, the legislative body may require the king to negotiate peace ; and the king is bound to yield to this requisition.

It belongs to the legislative body to ratify treaties of peace,

French Revolution, 1791.

French  
Revolution,  
1791.

peace, alliance, and commerce; and no treaty shall have effect but by this ratification.

The deliberations of the legislative body shall be public, and the minutes of the sittings shall be printed.

The legislative body may, however, on any occasion, form itself into a general committee.

The plan of a decree shall be read thrice; at three intervals, the shortest of which cannot be less than eight days.

The decrees of the legislative body are presented to the king, who may refuse them his consent.

In case of a refusal of the royal consent, the decree is only suspensive.—When the king has refused his assent, the same shall successively present the same decree in the same terms on which it was originally conceived, the king shall be deemed to have given his assent.

The king is bound to express his consent or refusal to each decree within two months after its presentation.

No decree to which the king hath refused his consent can be again presented to him by the same legislature.

The supreme executive power resides exclusively in the hands of the king.

The king is the supreme head of the land and sea forces.

The king names ambassadors, and the other agents of political negotiations.

He bestows the command of armies and fleets, and the ranks of marshal of France and admiral:

He names two-thirds of the rear-admirals, one-half of the lieutenant-generals, camp-m Marshals, captains of ships, and colonels of the national gendarmerie:

He names a third of the colonels and lieutenant-colonels, and a sixth of the lieutenants of ships:

He appoints in the civil administration of the marine, the directors, the comptrollers, the treasurers of the arsenals, the masters of the works, the under masters of civil buildings, half of the ministers of administration, and the under masters of construction.

He appoints the commissaries of the tribunals:

He appoints the superintendants in chief of the management of contributions indirect, "and the administration of the national domains:"

He superintends the coinage of money, and appoints officers intrusted with this superintendence in the general commission and the mints.

The effigy of the king is struck on all the coinage of the kingdom.

There is in each department a superior administration, and in each district a subordinate administration.

The administrators are specially charged with distributing the contributions direct, and with superintending the money arising from the contributions, and the public revenues in their territory.

The king has the right of annulling such acts of the administrators of department as are contrary to the law or the orders transmitted to them.

He may, in case of obstinate disobedience, or of their endangering, by their acts, the safety or peace of the public, suspend them from their functions.

The king alone can interfere in foreign political connexions.

Every declaration of war shall be made in these terms: *By the king of the French in the name of the nation.*

French  
Revolution,  
1791.

The judicial power can in no case be exercised either by the legislative body or the king.

Justice shall be gratuitously rendered by the judges chosen from time to time by the people, and instituted by letters patent of the king, who cannot refuse them.

"The public accuser shall be nominated by the people."

"The right of citizens to terminate disputes definitively by arbitration, cannot receive any infringement from the acts of the legislative power."

In criminal matters, no citizen can be judged except on an accusation received by jurors, or decreed by the legislative body in the cases in which it belongs to it to prosecute the accusation.

After the accusation shall be admitted, the fact shall be examined, and declared by the jurors.

The person accused shall have the privilege of challenging 20, without assigning any reason."

The jurors who declare the fact shall not be fewer than 12.

The application of the law shall be made by the judges.

The process shall be public, and the person accused cannot be denied the aid of counsel."

No man acquitted by a legal jury can be apprehended or accused on account of the same fact.

For the whole kingdom there shall be one tribunal of appeal, established near the legislative body.

A high national court, composed of members of the tribunal of appeal and high jurors, shall take cognizance of the crimes of ministers, and the principal agents of the executive power; and of crimes which attack the general safety of the state, when the legislative body shall pass a decree of accusation.

It shall not assemble but on the proclamation of the legislative body; and at the distance of journey, at least from the place of meeting of the legislative body."

The national guards do not form a military body, or an institution in the state; they are the citizens themselves called to arm the public force.

Officers are chosen from them, and cannot again be chosen till after a certain interval of service as privates.

None shall command the national guard of more than one district.

All the parts of the public force employed for the safety of the state from foreign enemies are under the command of the king.

Public contributions shall be debated and fixed every year by the legislative body, and cannot continue in force longer than the last day of the following session, if they are not expressly renewed.

Detailed accounts of the expence of the ministerial departments, signed and certified by the ministers or comptrollers general, shall be printed and published at the commencement of the sessions of each legislature.

The same shall be done with the statements of the receipt of the different taxes, and all the public revenues."

The French nation renounces the undertaking of any war with a view of making conquests, and will never employ its forces against the liberty of any people.

The constituting national assembly declares, "That the

French  
Revolution,  
1791.

the nation has the imprescriptible right of changing its constitution; and nevertheless considering that it is more conformable to the national interest to employ only by means provided in the constitution itself, the right of reforming those articles of it, of which experience shall have shown the inconveniences, decrees, that the proceeding by an assembly of revision shall be regulated in the form following:

"When three successive legislatures shall have expressed an uniform wish for the change of any constitutional article, the revision demanded shall take place."

"The next legislature, and the following, cannot propose the reform of any constitutional article."

"The fourth legislature, augmented with 240 members, chosen in each department, by doubling the ordinary number which it furnishes in proportion to its population, shall form the assembly of revision."

The French colonies and possessions in Asia, Africa, and America, "though they form part of the French empire," are not included in the present constitution.

With respect to the laws made by the national assembly which are not included in the act of constitution, and those anterior to which it has not altered, they shall be observed, so long as they shall not be revoked or modified by the legislative power.

98  
And accepted by  
the king.

On the 14th of September the king announced, by a letter to the president of the assembly, his acceptance of the constitution. This event was ordered to be notified to all the foreign courts, and the assembly decreed a general amnesty with respect to the events of the revolution. On the following day the king returned in person to the national assembly; and being conducted to a chair of state prepared for him at the foot of the president, he signed the constitutional act, and took an oath of fidelity to it. He then withdrew, and was attended back to the Tuilleries by the whole assembly, with the president at their head. On the 20th of September, this national assembly, which has since then known by the name of the *Constituent Assembly*, met in the hall, and gave place to the succeeding *Legislative National Assembly*, which had been elected according to the rules made by the new constitution.

99  
The assembly dissolved.

On the character and labours of the *Constituent Assembly*, we shall only remark, that it contained many men of talents, and, in all probability, a considerable number of men of integrity. Towards the close of its session, it assumed a very striking character of moderation, and appears to have been completely unparliamentary, although its jealousy of the ancient aristocracy prevented it from sufficiently guarding the throne against popular violence; for a very striking defect in the new constitution soon appeared. The king possessed a *veto*, or negative, upon the resolutions of the legislative body: but this negative he was bound to exercise in person, without responsibility, and without the intervention of his ministers. He had no senate, or upper chamber, to stand between him and popular violence; and there was something apparently absurd in setting the vote of an individual, in opposition to the collective wisdom and will of a whole nation. In consequence of this, he was reduced to the hard alternative of yielding to every wish of the national assembly, or of exposing himself personally to public odium.

100  
Character and labours of the constituent assembly.

The new assembly was opened by the king on the 17th of October, with much apparent union on all sides. His speech, recommending unanimity and confidence between the legislative and executive powers, was received with unbounded applause. The character of the men who compose the new national assembly was unpropitious to the court. At the commencement of the revolution, the great body of the people at a distance from the capital were little interested in those projects of freedom which occupied the more enlightened and more numerous inhabitants of Paris. They had gradually been roused from their lethargy. The violence of powers conferred by the new constitution upon the people, and the multiplicity of offices of which it gave them the patronage, had kindled in the minds of men a love of dominion, and a wish to interfere in public affairs. This attached them to the new order of things. The love of power, which is the least defensible passion in the human heart, and equally strong in the breast of the meanest and of the highest of mankind, was thus, under the name of liberty, become a leading passion throughout this wide empire. They who flattered it most, and were most loud in praise of the rights of the people, became speedily the favourites of the public. The consequence of this was, that the new national assembly was chiefly composed of country gentlemen, of principles highly democratic, or of men of letters who had published popular books, or conducted periodical publications. The members of the constituent assembly had been excluded by their own decree from holding seats in the new legislature. The members of the latter, therefore, had little regard for a constitution which they themselves had not framed, and which was not protected by the venerable sanction of antiquity.

When this assembly first met, it showed a very trifling attention to formalities, and a peevish jealousy of the ministers of the crown. In the mean time, the treaty of Pilnitz, already mentioned, began to be rumoured abroad, and France was thrown into a state of anxious jealousy for the safety of its newly-acquired liberties. Although the Prussians and Germans (the elector of Mentz alone excepted) all continued to temporize, the northern powers, Sweden and Russia, entered into strict engagements to restore the old despotism of France. On the 9th of November, a decree was passed, that the emigrants who, after the first of January next, should be found assembled, as at present, in a hostile manner, beyond the frontiers, should be considered as guilty of a conspiracy, and suffer death; that the French princes, and public functionaries, who should not return before that period, should be punishable in the same manner, and their property forfeited during their own lives. On the 18th, a series of severe decrees was also passed against such of the ejected clergy as still refused to take the civic oath. To both these decrees the king opposed his *veto*, or negative. The moderate party, who were attached to the constitution, rejoiced at this as a proof of the freedom of their sovereign. But, on the other side, it excited a most violent clamour, and became the means of exciting new suspicion of the wishes of the court. At this time answers were received from the different foreign courts to the notification sent them of the king's acceptance of the new constitution. These were generally conceived in a style of caution, and avoided giving

open offence. The emperor even prohibited all assem-  
blages of emigrants within his states; and the king  
intimated to the assembly that he had declared to the  
elector of Treves, that unless the emigrants should  
cease before the 15th of January to make hostile prepa-  
rations within his territories, he would be considered as  
the enemy of France. All this, however, did not pre-  
serve the court from suspicion; for although the diffe-  
rent foreign courts had openly declared pacific inten-  
tions, yet the French emigrants boldly asserted, that all  
Europe was actually arming in their favour. Accord-  
ingly they ceased not to solicit their equals to arms,  
who still remained within the country, to join with them  
in what they called the *royal cause*. The unhappy Louis,  
placed between a republican party that was gradually gathering strength, and an  
aristocratical party that was rousing Europe to arms  
against a nation of which he was the constitutional  
chief, and a combination of princes justly suspected of  
wishing to seize upon a part of his dominions, stood in  
a situation which would have perplexed the most skillful  
statesman; and it is no proof of incapacity that he fell  
a sacrifice to circumstances which might have over-  
whelmed any known measure of human ingenuity. Ad-  
dresses were crowded into the assembly, disapproving  
the conduct of the court. M. Montmorin resigned;  
M. Delessart succeeded him; and M. Cahier de Ger-  
ville became minister of the interior. M. du Portail  
resigned also, and M. Narbonne succeeded him as mi-  
nister of war. In the month of November, M. Bailly's  
mayoralty terminated; and the once popular La Fayette  
appeared as a candidate to succeed him. But he was  
successfully opposed by M. Petion, a violent Jacobin,  
and a declared republican, who was elected mayor of  
Paris by a great majority.

At this period the moderate men, who were friends  
of the constitution, attempted to counteract the influ-  
ence of the Jacobin club by the establishment of a si-  
milar one. It derived its name from the vacant con-  
vent of the *Feuillans*, in which it assembled. The most  
active members of the constituent assembly belonged  
to it, such as M. M. D'Andre, Barnave, the Lameths,  
Du Port, Rabaud, Sieyes, Chapelier, Thouret, La-  
bord, Taleyrand, Montesquieu, Beaumetz, &c. The  
Jacobins contrived to excite a riot at the place of their  
meeting, which was in the vicinity of the hall of the  
national assembly. This afforded a pretext for ap-  
plying to the assembly for the removal of the new club.  
The assembly showed their disposition, by complying  
with this request.

At the end of this year, the kingdom of France  
was by no means prosperous. The public revenue had  
fallen far short of the expenditure. The emigrant na-  
poleon had carried out of the kingdom the greater part  
of the current coin, and a variety of manufacturers,  
who depended upon their ostentatious luxury, were re-  
duced to much distress. The dispositions of foreign  
courts appeared very doubtful. The new year, how-  
ever, opened with delusive prospects of tranquillity.—  
The German princes appeared satisfied with the mode  
of compensation which the French had offered for the  
loss of their possessions in Alsace and Lorraine. The  
prince of Lowenstein accepted of an indemnification.—  
The princes of Hohenlohe and Salm-Salm declared  
themselves ready to treat upon the same terms. Prince

Maximilian, and the dukes of Wirtemberg and Deux-  
Ponts, freely negotiated. It is unnecessary to state in  
detail the subtleties employed, in the mean time, by  
the crafty Leopold, for amusing the French with the  
appearances of peace. M. Delessart, minister for fo-  
reign affairs, fell a sacrifice to them, and probably to  
the undecided character of Louis. He was accused  
by M. Brissot of not having given timely notice to the  
national assembly of the dispositions of foreign powers,  
and of not pressing proper measures for securing the ho-  
nour and safety of the nation. A decree of accusation  
passed against him in his absence. He was apprehend-  
ed, tried by the high national court at Orleans, and  
executed in consequence of its sentence.

The sudden death of Leopold on the first of March  
gave rise to a transient hope that peace might still be  
preserved. A suspicion of poison fell upon the French,  
but it was removed by the detail of his disease that was  
speedily published. On the 16th of the same month,  
the king of Sweden was wounded by a nobleman of  
the name of Ankerstrom, and died on the 29th. This  
enterprising prince had overthrown the constitution of  
his own country, and he had formed the project of con-  
ducting in person his troops to the frontiers of France,  
and of commanding or accompanying the combined ar-  
mies of Europe in their attempt to avenge the cause of  
insulted royalty. It was in a great measure to counter-  
act this scheme that he was assassinated.

The sudden fall, however, of these two enemies ra-  
ther accelerated than retarded the meditated hostilities.  
The young king of Hungary, who succeeded to the late  
empire, made no secret either of his own intentions or  
of the existence of a concert of princes against France.  
M. Dumourier was now at the head of the war office.  
M. Rolland was minister of the interior, and M. Cla-  
viere minister of finance. The Jacobins were all-power-  
ful. The court gave way to the torrent. The pro-  
perty of the emigrants was confiscated, retaining the  
rights of creditors. The imperial minister, Prince  
Kaunitz, demanded three things of France: 1<sup>st</sup>, The  
restitution of their feudal rights to the German princes;  
2<sup>dly</sup>, To restore Avignon to the pope; the inhabitants  
of which had some time before thrown off their allegi-  
ance, and prevailed with the constituent assembly to  
receive their country as a part of France; and 3<sup>dly</sup>,  
Prince Kaunitz demanded, that the neighbouring  
powers should have no reason for apprehension from the  
present weakness of the internal government of France.  
On rejecting these demands, the king proposed a decla-  
ration of war, which was decreed by the national as-  
sembly on the 20th of April, against the king of Hun-  
gary and Bohemia.

The French immediately began the war, by attack-  
ing in three different columns the Austrian Netherlands.  
M. Theobald Dillon advanced from Lille to Tournay,  
where he found a strong body of Austrians ready to re-  
ceive him. The national troops, unaccustomed to su-  
stain the fire of regular soldiers, were instantly thrown  
into confusion, and fled even to the gates of Lille. The  
cry of treason resounded on all sides; and their com-  
mander, an experienced and faithful officer, was mur-  
dered by his own soldiers and the mob. A second di-  
vision of 10,000 men, under Lieutenant-general Biron,  
took possession of Quivrain on the 29th, and marched  
towards Mons. General Biron was here attacked by

French Revolution, 1792. the Austrians, whom he repulsed. Hearing, however, of the defeat of Dillon, he retreated. A third party advanced to Furnes, but afterwards withdrew. La Fayette at the same time advanced towards Bouvines, half way to Namur, from which he afterwards retreated. The whole of these expeditions were ill contrived, in as much as they divided the French undisciplined troops, and exposed them in small bodies to the attack of veteran forces. The Austrians were some time before they attempted to retaliate. At length, however, on the 11th of June, they attacked M. Gouvion, who commanded the advanced guard of La Fayette's army near Maubeuge. M. Gouvion was killed by a rolling bullet; but La Fayette himself, having come up, the Austrians abandoned the field. In the mean time, matters were hastening in Paris towards a violent crisis. Two parties, both of which were hostile to the present constitution, had gradually been formed in the state. The one wished to give more effectual support to the royal authority, by establishing a senate or two chambers, to prevent the king's veto from being the sole check upon popular enthusiasm. The other party wished to set aside royalty altogether, and to hazard the bold experiment of converting France into a republic. These last were supported by the Jacobin club, which had now contrived to concentrate in itself an immense mass of influence. Innumerable popular societies were established in every town and village throughout the provinces. With these a regular correspondence was kept up by writing and by emissaries. Thus schemes and notions were instantaneously propagated through a great empire, and all the violent spirits which it contained were enabled to act in concert: But the more immediate engine of the republican party consisted of the immense population of the metropolis, whom they now endeavoured to keep in constant alarm. For this purpose they alleged, that an Austrian Committee, that is to say, a conspiracy in favour of the enemies of the country, existed among the friends of the court. M. M. Goussier and Dandré even offered in the assembly to prove the existence of this pretended Austrian committee. A report was next circulated, that the king intended to abscond from the capital on the 29th of May. His majesty publicly contradicted these accusations as calumnies, but they made no small impression upon the minds of the public. New decrees were now made against the refractory clergy, but these his majesty refused to sanction. A proposal was also made and decreed in the assembly to form a camp of 40,000 men under the walls of Paris, and that for this very emergency cantons in the kingdom should contribute one hundred and four infantry. The national guard of Paris disliked the proposal, and the king gave to it his negative. Indeed at this time the king seems to have come to a resolution of standing out against the Jacobin party, for which he had for some time yielded. The ministry were therefore dismissed, excepting M. Dumourier, and others were appointed in their stead. By this event Dumourier lost the confidence of the Jacobin club. He saw his error, resigned his office, and joined the army. In the mean time a decree had been passed, authorizing the manufacture of pikes for the purpose of arming cheaply the lower class of citizens. All means were used to render the king odious by inflammatory writ-

ings and harangues; and in both of these the noted incendiary Marat took the lead.

On the 20th of June M. Roederer, the Procureur General Syndic informed the national assembly, that, contrary to law, formidable bodies of armed men were preparing to present petitions to the king, and to the national assembly. A part of them speedily appeared with St. Honoré and Santerre a brewer at their head. They marched through the hall in a procession that lasted two hours, at four o'clock in the afternoon, to the number of about 10,000. They surrounded the assembly. The gates were thrown open; and on an attempt to break the door of the apartment, where the king then was, he ordered them to be admitted. His son the prince de Elizabeth never departed from his side during four or five hours that he was surrounded by the multitude, and compelled to listen to every indignity. All this while Petion, the mayor of Paris, was unaccountably absent. He at length, however, arrived, and with a deputation from the assembly. The queen, with her children and the prince de Lamballe, were in the mean time in the council-chamber, where, though protected from violence, they were yet exposed to much insult. At last, in consequence of the approach of evening, and of the entreaties of Petion, the multitude gradually dispersed.

The indignities suffered on this day by the royal family were in some respects not unfavourable to their cause. A great number of the most respectable inhabitants of the capital were ashamed of such proceedings. They complained of them severely in a petition to the assembly, and addresses to the same purpose were received from several departments. The directory of the department of Paris, at the head of which were M. Rochefaucault and M. Talleyrand, published a declaration disapproving of the conduct of the mayor, and of M. Manuel the procureur of the commune, whom they afterwards suspended from their offices, although they were speedily restored by a decree of the assembly. At the same time, La Fayette leaving his army suddenly, appeared on the 26th at the bar of the national assembly. He declared that he came to express the indignation which the whole army felt on account of the events of the 20th: he called upon the assembly to punish the promoters of these events, and to dissolve the factious clubs. The sudden appearance of La Fayette threw the Jacobins into consternation, and from that period they never ceased to calumniate him.

On the 1st of July, on the motion of M. Jean de Brie, the assembly ordered a proclamation to be made, that the country was in danger. On the 6th, the king gave intimation that the king of Prussia was marching with 52,000 men to co operate against France. The French arms were at this time somewhat successful in the Austrian Netherlands; but the cabinet speedily thought it necessary to order the armies to retreat: a measure which was afterwards publicly censured by Marshal Luckner.

On the 7th, a singular scene occurred in the national assembly. At the instant that M. Brissot was about to commence an oration, M. Lamourette bishop of Lyons requested to be heard for a few minutes. He expatiated on the necessity of union among the members of the assembly, and of sacrificing their passions and prejudices

judices on the altar of their country. He concluded an animated address with these words, "Let all who hold in equal detestation a republic and two chambers, and who wish to maintain the constitution as it is, rise!" The words were scarcely pronounced when the whole assembly started from their seats. Men of all parties solemnly embraced each other, and protested their adherence to the constitution. A deputation announced this happy event to the king, who immediately came and congratulated them in a short speech, which was received with infinite applause. The only speech, however, produced by this temporary excitement was, that the festival of the 14th of July, which was celebrated with the usual magnificence, passed over in tranquillity.

116  
Manifesto  
of the  
duke of  
Brunswick.

On the 25th of July, the duke of Brunswick issued at Coblenz his celebrated manifesto. It declared the purpose of the intended invasion of France to be the restoration of the French king to full authority. It declared the national guard of France responsible for the preservation of tranquillity; and threatened with the punishment of death, as rebels to their king, those who should appear in arms against the allied powers. All men holding offices, civil or military, were threatened in the same manner, as well as the inhabitants of all cities. The city of Paris in particular, and the national assembly, were declared responsible for every insult which might be offered to the royal family. It was declared, that if they were not immediately placed in safety, the allies were resolved to inflict "on those who should deserve it the most exemplary and ever memorable avenging punishments, by giving up the city of Paris to military execution, and exposing it to total destruction; and the rebels who should be guilty of illegal resistance should suffer the punishments which they should have deserved." This sanguinary and imprudent manifesto operated as a warrant for the destruction of the unfortunate Louis XVI. It left no middle party in the nation. All who wished to preserve freedom in any form, and all who loved the independence of their country, were instantly united. At the same time, the reproaches cast on the king by the Jacobins now gained universal credit. The kings of Prussia and of Hungary told the French nation, that their monarch was secretly hostile to the constitution; and the restoration of him and his family to despotic power was made the sole pretence for a bloody and dangerous war.

117  
Injurious to  
Louis,

118  
but advantageous to the republican party, who resolve to depose him.

The republican party saw the advantage which they had now gained, and resolved upon the deposition of the king. The chief engine which they meant to employ in this service consisted of about 1500 men, who had come to Paris at the period of the confederation on the 14th of July, and therefore called *fédérés*, and who were sometimes also denominated *Marseillois*, from the place from which the greater number of them came. Next to these, dependence was placed in the populace of the suburbs of the capital. The designs of the republicans were not unknown to the court, and both parties were forming plans of operation. It is said that the royal party intended that the king and his family should suddenly leave the capital, and proceed to as great a distance as the constitution permitted. The republicans are said to have intended to seize the person of the king, and to confine him in the castle of Vincennes till a national convention should decide upon his

fate. Both allegations are probably true. Every motive which can influence the mind of man must have induced Louis to wish to be at a distance from the factious and sanguinary capital. And the subsequent conduct of the republicans authorize us to believe them capable of the worst crime that was laid to their charge.

French  
Revolution.  
1792.

Various charges had been brought forward in the assembly against La Fayette, and the 8th of August was appointed for their discussion. In the mean time, on the 3d of August, Petion the mayor, at the head of a deputation from the sections of Paris, appeared at the bar, and in a solemn speech demanded the deposition of the king. The discussion of the accusation against La Fayette was considered as a trial of strength between the parties: he was acquitted, however, by a majority of nearly 200; and the republican party, despairing of carrying their point by a vote of the national assembly, resolved to have recourse to insurrection and force.

119  
La Fayette  
accused and  
acquitted.

On the evening of the 9th of August, about 1500 gentlemen, officers of the army, and others, repaired to the palace, resolved to protect the royal family or to die in their defence: added to these were 700 Swiss guards, with a body of artillery amounting to about 1000. Mandat, the commander of the national guards, a man who was firmly attached to the constitution, had procured 2400 of that body and 24 pieces of cannon. With such a force, it has been generally thought that, by vigorous and steady councils, the palace, which is a kind of castle, might have been successfully defended; and what is now called a revolution might have borne the name of a rebellion. Meanwhile the assembly declared its sittings permanent. Petion was at the palace late on the evening of the 9th. Some apprehensions were entertained, or pretended to be entertained, for his safety (for the whole of this business was, on the part of the republicans, the most infernal plot), and a deputation from the assembly brought him away. At midnight the tocsin or alarm bell was sounded, and the drums beat to arms through the city. At the same time a number of the most illustrious of the republican party assembled, and elected a new common council or commune. The persons thus designated instantly took possession of the assembly hall, and drove out the lawful members; who, with that weakness which which has for a long time been the bane of the republicans in perilous times, readily gave place to the usurpers. The new commune first appointed Mandat to M. Mandat, requiring his attendance upon important business. He was occupied in arranging the troops in the best order around the palace; but suspecting nothing, he went to the common hall; and was there astonished to find a different assembly from what he expected. He was abruptly accused of a plot to massacre the people, and ordered to prison; but as he descended the stairs, he was shot with a pistol, and Santerre was appointed in his stead to command the national guard.

120  
Horrid plot  
of the re-  
publicans.

On this eventful night no person in the palace went to bed. About six o'clock in the morning of the 10th the king descended into the gardens to review the troops. He was received with shouts of *Vive le roi* excepting from the artillery, who shouted *Vive la nation*. The king returned to the palace, and the multitude continued to collect. The national guard seemed undetermined about what they were to do, as they assembled in divisions near the palace; and had a steady resistance

French assistance been made from within, it is probable they would have joined the royal party. But towards eight o'clock M. Roederer procured admittance to the palace, and told the king that armed multitudes were assembling in hostile array around the Thuilleries; that the national guard was not to be depended upon; and that, in case of resistance, the whole royal family would most certainly be massacred. He therefore advised the king to seek protection in the hall of the national assembly. With this advice the king, with his usual facility of temper, was ready to comply; but the queen opposed with vehemence the humiliating proposal. Becoming gradually, however, alarmed for the safety of her children, she gave her consent; and the king and queen, the prince Elizabeth, with the prince and princess royal, went on foot to the hall of the assembly.

121  
The royal family fly for safety to the hall of the national assembly.

"I am come hither (said his majesty) to prevent a great crime. Among you, gentlemen, I believe myself in safety." By an article of the constitution the assembly could not deliberate in presence of the king. The royal family were, therefore, placed in a narrow box separated from the hall by a railing, where they remained for a short time without any place to which they could retire for refreshment, excepting a very small closet adjoining. Here they sat listening to debates, in which the royal chamberlains and other were treated with every mark of insult.

When the king left the palace of the Thuilleries, he unfortunately forgot to order it to be immediately surrounded. He recollected this as soon as he reached the assembly, and sent orders for this purpose; but it was now too late. The insurgents amounted to about a thousand effective men. They were drawn up in tolerable order by Westerman a Prussian, and had about 30 pieces of cannon along with them. The gentlemen within the palace, who had assembled to protect the king's person, were now dispirited, and knew not what to do.

122  
A bloody combat in the palace in which most of the Swiss guards are massacred.

The commander of the Swiss, M. Affry, knew not what to do; and the captain knew not what to do; and the national guard had no leader in consequence of the death of their leader. About nine o'clock the outer gates were forced open, and the insurgents formed their line in front of the palace. A bloody combat commenced chiefly between the Swiss and the Swiss. After a brave resistance of about an hour, the Swiss were overpowered by numbers, and gave way. All of them that could be found in the palace were massacred, some even while imploring quarter on their knees. Others escaped into the city, and were protected by individuals. Of this brave regiment, however, only 300 survived; but every human being, even the French servants found in the palace, were put to death. The Swiss taken prisoners in various quarters were conducted to the door of the assembly, and taken by a decree under the protection of the state. But the sanguinary multitude insisted upon putting them to instant death; and the assembly would, in all probability, have been unable to protect them, had not the Marquis de La Fayette interfered in their favour.

123  
The royal authority suspended, and royal family imprisoned.

The suspension of the royal authority was now decreed, and the nation was invited to elect a Convention to determine the nature of its future government. On this uncommon occasion all Frenchmen of 21 years of age were declared capable of electing, and of being elected, deputies to the new national convention. Com-

missioners were, in the mean time, sent on the same evening to give to the armies a false and favourable account of these transactions. The royal family were sent to the old palace of the Temple in the midst of the city, to remain there under a strict guard; and all persons of rank who had been attached to them were seized and committed to the different prisons.

French Revolution, 1792.

To give an idea of the temper of the people of Paris at this time, it is proper to remark, that at the same instant when the multitude with bloody fury were massacring the royal servants in the palace, and could scarcely be restrained from offering violence to the king who were made prisoners, they would suffer no act of violence to pass unpunished. Several attempts of this kind were accordingly followed by the instant death of the criminals. The plate, the jewels, and money found in the Thuilleries were brought to the national assembly, and thrown down in the hall. One man, whose dress and appearance bespoke extreme poverty, cast upon the table a hat full of gold. But the minds of these men were elevated by enthusiasm; and they conceived themselves as at this moment the champions of freedom, and objects of terror to the kings of the earth.

124  
Bloody temper of the people of Paris, &c.

In the mean time, the situation of France was extremely critical, and it appeared very doubtful if the new convention would ever be suffered to assemble. La Fayette had accidentally got speedy notice of the events of the 10th of August. He advised the magistrates of the town of Sedan to imprison the commissioners from the national assembly when they should arrive there; which was accordingly done. He, at the same time, published an address to his army, calling upon them to support the king and the constitution; but finding that they were not to be depended upon, on the 19th August he left his camp in the night, accompanied only by his staff and a few servants. They took the route of Rochefort in Liege, which was a neutral country; but were met by a part of the enemy, who took them prisoners, and they were detained in Prussian and Austrian dungeons, till autumn 1794, when it is said that La Fayette himself made his escape. The severe treatment of this man was probably a considerable error in policy on the part of the allies. His fidelity to his king is very generally admitted; though some have entertained strong suspicions of his having acted a very base part to that unfortunate monarch; and in the British house of commons he has been called an abandoned ruffian. This expression is certainly too strong. His errors seem to have been those of the head rather than of the heart; and at all events, he should have been protected by the allies if for no other reason than to encourage subsequent desertions among the officers of the republican army.

125  
Critical situation of the whole kingdom.

126  
La Fayette withdraws from the army—His late and character.

To return from this digression. The commissioners were soon set at liberty at Sedan, and received with applause by the army of La Fayette. General Arthur Dillon at first entered into the sentiments of La Fayette; but the politic Dumourier diverted him from his purpose, and by this means regained his credit with the Jacobins, and was appointed commander in chief. The other generals, Biron, Montesquieu, Kellerman, and Custine, made no opposition to the will of the national assembly.

Meanwhile, the combined armies of Austria and Prussia had entered France. The duke of Brunswick's

great force.

army was about 50,000 strong. General Clairfait had joined him with 15,000 Austrians, and a considerable body of Hessians, along with 20,000 French emigrants, amounting in all to 90,000 men. To oppose these, Dumourier had only 17,000 men collected near the point from which the enemy were approaching in Luxembourg. The French emigrants had given the duke of Brunswick such an account of the distracted state of their own country, and of the pretended disaffection of all orders of men towards the ruling faction in Paris, that no resistance of any importance was expected. When the combined troops, consisting either of steady Austrian or Hungarian battalions, or of those well disciplined Prussians which the great Frederick had inured to the best military discipline, were reviewed in Germany before setting out on their march, it is said that the spectators, among whom the French cause was not unpopular, beheld them with anxiety and regret, and pitied the unhappy country against which this irresistible force was directed. The soldiers and their officers regarded themselves as departing for a hunting match, or an excursion of pleasure; and many of the usual accommodations of an army were ill attended to, such as hospitals, &c. The beginning of their progress into France justified these expectations. Longwy surrendered after a siege of 15 hours, although well fortified, possessed of a garrison of 3500 men, and defended by 71 pieces of cannon. The news of this event irritated the assembly so much, that they decreed, that, when retaken, the houses of the citizens should be razed to the ground; and, distrustful of the officers of the army, they decreed that the municipal officers of a town should hereafter have power to controul the deliberations of the council of war. Verdun was next summoned; and here the municipality compelled the governor M. Beaurepiere to surrender. That officer, disappointed and enraged, shot himself dead with a pistol in presence of the council, and on the 2d of September the Prussian troops entered the town.

128  
Alarm at  
Paris on  
account of  
their suc-  
cess.

The news of this second capture, and of the approach of the Prussians, spread an instant alarm through Paris. It was proposed to raise a volunteer army, which should set out immediately to meet the enemy. The common council, which was now led by Robespierre, Danton, Marat, and others of the most sanguinary character, ordered the alarm guns to be fired; and the populace to be summoned to meet in the Champ de Mars to enroll themselves to march against the enemy. The people assembled, and either in consequence of a premeditated plan, or, which is not very probable, of an instantaneous movement, a number of voices exclaimed, that "the domestic foes of the nation ought to be destroyed before its foreign enemies were attacked."

129  
Horrid  
massacre.

Parties of armed men proceeded without delay to the prison where the non-juring clergy, the Swiss officers, and those confined since the 10th of August on account of practices against the state, were detained in custody. They took out the prisoners one by one, gave them a kind of mock trial before a jury of themselves, acquitted some few, and murdered the rest. Among these last was the princess de Lamballe. She was taken from her bed before this bloody tribunal, and massacred; her head was carried by the populace to the Temple, to be seen by the queen, whose friend she was.

These massacres lasted for two days, and upwards of 1000 persons were put to death. There is scarce any thing in history that can be represented as parallel to them; they were committed, it is said, by less than 300 men, in the midst of an immense city, which heard of them with horror, and in the vicinity of the national assembly, which, by going in a body, could have put an end to them. But such was the confusion and dismay of these two disgraceful days, that no man dared to stir from his own house; and every one believed that the whole city, excepting his own street, was engaged in massacre and bloodshed. The national guards were all ready at their respective posts, but no man directed them to act: and there is too much reason to suspect that Santerre and the chiefs of the commune connived, at least, at the transaction.

French  
Revolution  
1792.

In the mean time, General Dumourier was taking the best measures to protract the march of the enemy till the army of Kellerman, consisting of 20,000 men, could join him from Lorraine, and that of Bournonville from Flanders, amounting to 13,000; together with whatever new levies Luckner might be able to send him from Chalons. The forest of Argonne extends from north to south upwards of 40 miles; it lay directly in the route of the duke of Brunswick, who must either force his way across it, or make a circuit of 40 miles by the pass of Grandpré on the north, or by Barleduc on the south. The pass that lay directly in his route was that of Biesme. After surveying Dillon's position here, he left a party of 20,000 men to watch it; and with the main body of his army took the circuitous route by Grandpré on the north. Here Dumourier waited to receive him, and was attacked on the 12th and 13th without success: but on the 14th, the attack of the Prussians was irresistible, and Dumourier retreating, gave up the pass. On his march he was violently pressed by the advance cavalry of the Prussians, that his army, at one time, was seized with a panic, and fled before 1500 men; who, if they had pushed their advantage, might have dispersed it. On the 15th, however, Dumourier encamped at St. Mesmeuld, and began to fortify it. Bournonville's army joined Dumourier on the 17th. The duke of Brunswick formed a plan of attacking Kellerman before his junction could be completed. That general arrived on the 19th within a mile of Dumourier's camp; the projected attack took place, the Prussians manœuvred with their usual coolness and address; they attempted to surround Kellerman's army, but this could not be accomplished. The French troops preserved excellent order, while the national vivacity was constantly showing itself in their shouts and patriotic songs: 400 French were killed, and 500 wounded; the loss of the Prussians was much greater: and, in the face of the enemy, Kellerman joined Dumourier at the end of the engagement without opposition. At the time that the attack was made on the army of Kellerman, an attempt was made to force Dillon's camp at Biesme by the 20,000 men that had been left in its vicinity, but without success; and this large detachment was thus prevented from crossing the forest of Argonne and joining the duke of Brunswick. It is to be observed, that in these engagements the French owed their superiority chiefly to the excellence of their artillery; a circumstance which served to convince their enemies that they had

130

State of  
the French  
army, and  
conduct of  
Dumou-  
rier.

131

The Prus-  
sians oblige

low up.

French Revolution, 1792. had to contend with regular military bodies, and not with undisciplined multitudes, as they expected.

The duke of Brunswick encamped his army at La Lun, near the camp of Dumourier. And here the Prussians began to be in extreme distress both from sickness and famine. No temptation could induce the inhabitants of the country to carry provisions to the hostile camp, while at the same time the French army was abundantly supplied.

Bourbonville, with a body of 4000 men, intercepted several droves of cattle and other convoys of provisions destined for the Prussians. The rain fell in torrents, and the roads were uncommonly deep. Exposed to the cold, the moisture, and want of provisions, the Prussians rashly ate great quantities of the grapes of Champagne. The consequence of this was, that an epidemical distemper commenced and spread through the army to such an extent, that 10,000 men at one time were unfit for duty. The duke of Brunswick, however, still commanded a force much more numerous than that of Dumourier; and he has been much censured for not attacking his camp, and forcing him to engage. It has been said, that the veteran and numerous force which he commanded would have marched to certain victory against the raw troops that opposed them; that, having defeated Dumourier's army, there was nothing to oppose their march to Paris. But the duke of Brunswick had entered France upon the supposition, that in its present distracted state no regular army could be brought into the field against him, and that the people at large were hostile to the ruling faction. The contrary of all this had turned out to be true. He found himself in the midst of an hostile people, and opposed by skilful military chiefs. A defeat in such a situation would have brought certain ruin to his army; and even the loss sustained in the acquisition of a victory might have proved equally fatal. The remains of the French army would not fail to hang upon his rear; and from the disposition of the people it appeared impossible to ascertain to what amount that army might be suddenly increased. After proposing a truce, therefore, which he did not accept, he commenced his retreat towards Gravelines, and no advantage was gained over him in the course of it. Rouen was retaken by the French on the 12th of October, and Longwy on the 18th; the siege of Thionville was at the same time raised. That small, but strong fortress, under the command of General Felix Wimpfen, had held in check an army of 15,000 men.

133. While the Prussians were advancing from the north-east, the Austrians under the duke of Saxe-Teichen laid siege to Lille. The council-general of the commune answered the summons of the besiegers thus: "We have just renewed our oath to be faithful to the nation, and to maintain liberty and equality, or to die at our post. We will not perjure ourselves." Such was the cant of these men who had already perjured themselves by contributing to overturn the constitution which they had repeatedly sworn to defend. The Austrian batteries began to play upon the town on the 29th, and were chiefly directed against that quarter which was inhabited by the lower class of citizens, for the purpose of making them mutinous and seditious. This procedure was ill judged. The lower classes of mankind are always much accustomed to hardships, and they go farthest in

support of any enthusiastic principle they have been persuaded to adopt. Accordingly, though a great part of the city was reduced to a heap of ruins, the citizens of Lille became daily more obstinate. They received each other into the houses that were still standing, and every vault and cellar was occupied. Although upwards of 30,000 red-hot balls and 6000 bombs were thrown into the city, besides the efforts made by an immense battering train of artillery, yet the loss both to the garrison and people did not exceed 500 persons, most of whom were women and children. After a fortnight of fruitless labour the Austrians raised the siege.

134. War had been declared against the king of Sardinia on account of the threatening appearances exhibited in that quarter. On the 20th of September General Masséna entered the territories of Savoy, and was received at Chambery and throughout the whole country with marks of unbounded welcome. On the 29th General Anselm, with another body of troops, took possession of Nice and the country around it. On the 30th General Custine advanced to Spire, when he found the Austrians drawn up in order of battle. He attacked and drove them through the city, taking 3000 of them prisoners. The capture of Worms succeeded that of Spire; Mentz surrendered by capitulation; and Frankfurt fell into the hands of the French on the 23d. Out of this last place, however, they were afterwards driven on the 2d of December.

135. On the 20th of September the French National Convention assembled. It was found to contain men of all characters, orders, and ranks. Many distinguished members of the Constituting Assembly were elected into it, and also several that had belonged to the Legislative Assembly; even foreigners were invited to become French legislators. The famous Thomas Paine and Dr Priestley of England were elected by certain departments; but the latter declined accepting. Clouts a Prussian, whom we formerly noticed as bringing a deputation to the bar of the constituent assembly, consisting of persons representing all the nations of the earth, was also chosen. The general aspect of the new convention showed that the republican party had acquired a decided superiority. On the first day of meeting M. Collot D'Herbois, who had formerly been an actor, ascended the tribune, and proposed the eternal abolition of royalty in France. The question was carried by acclamation, and the house adjourned. Messages were sent to all parts of the country to intimate the decree, and by the influence of the Jacobins they were everywhere received with applause. It was next day decreed, that all public acts should be dated by the year of the French republic; and all citizens were declared eligible to all the vacant offices and places. The rage of republicanism soon went so far, that the ordinary titles of Monsieur and Madame were abolished, and the appellation of Citizen substituted in their stead, as more suitable to the principles of liberty and equality.—It may be remarked, that in this last trifling circumstance an attachment to the form of speech to which they had been accustomed appears even in its abolition: For, although the Roman orators addressed their countrymen when assembled by the honourable appellation of Citizens, yet they never, in addressing an individual, called him Citizen Cato, or Citizen Cæsar, according to the mode now adopted in France.

French  
Revolution,  
1792.

137  
Two op-  
posite fac-  
tions in the  
convention.

It was soon discovered that the leading republicans had divided into two opposite factions. The one of these was called *Girondists*, because Vergniaud, Gensonné, Guadet, and some others of its leaders, were members from the department of La Gironde. The celebrated Condorcet belonged to this party; and they were sometimes denominated *Brissotines*, from M. Brissot de Warville their principal leader. They supported the ministry now in office, at the head of which was Roland; and the majority of the convention was obviously attached to them. In opposition to them was the smaller party of the *Mountain*; so called from its members usually sitting in the convention on the upper seats of the hall. They were men possessed of less personal respectability, and fewer literary accomplishments, but of daring and sanguinary characters, whom the revolution had brought into public notice. At the head of this party was Danton and Robespierre; and subordinate to these were Couthon, Bazire, Thuriot, Merlin de Thionville, St André, Camille Demoulin, Chabot, Collot D'Herbois, Sergent, Legendre, Fabre D'Eglantine, Panti, and Marat.

These two parties showed the diversity of their characters in the manner in which they treated the massacres of the 2d and 3d of September. The Brissotines, with the majority of the convention, wished to bring the murderers to trial; but the question was always eluded by the other party, with the assistance of the Jacobin club and of the populace.

138  
Decree a-  
gainst the  
emigrants,  
&c.

On the 9th of October it was decreed, that all emigrants, when taken, should suffer death; and on the 15th of November, in consequence of an insurrection in the duchy of Deux Ponts, and an application on the part of the insurgents to the convention for aid, the following decree was passed: "The national convention declare, in the name of the French nation, that they will grant fraternity and assistance to all those people who wish to procure liberty; and they charge the executive power to send orders to the generals to give assistance to such people as have suffered, or are now suffering, in the cause of liberty." Of this decree foreign nations, with great reason, complained much, as will shortly appear.

139  
Battle of  
Jemappe,  
and surren-  
der of the  
Austrian  
Nether-  
lands.

To return to the military affairs of the new republic. On the 12th of October General Dumourier came to Paris, and was speedily sent to commence a winter campaign in the Netherlands. He suddenly attacked the Austrians at the village of Rossu, and drove them from their ground. On the 5th of November he came in sight of the enemy upon the heights of *Jemappe*. Three rows of fortifications arose above each other defended by 100 pieces of cannon. Their right was covered by the village and a river, and their left by thick wood. The French were by their own account 30,000, whilst others with great probability of truth compute them at double that number, and the number of the Austrians was at least 20,000. At seven in the morning of the following day a heavy cannonade commenced on both sides, and at noon a close attack was determined on by the French, whose right wing was commanded by Generals Bournonville and Dampierre, and the centre by General Egalité (son to the duke of Orleans who had assumed that name), Stetenbosse, Desforets, and Drouet. The music played the popular march of the Marseillois, and the soldiers rushed on with enthusiasm, shouting "Vive la nation." The en-

gagement was warm and bloody; the French were twice repulsed; but their impetuosity was at last irresistible, and about two o'clock the enemy fled from their last intrenchments. The loss on both sides was very great, that of the Austrians amounting to 4000. This victory was decisive of the fate of the Netherlands. Mons and Brussels surrendered to Dumourier; Tournay, Malines, Ghent, and Antwerp, were taken possession of by General Labourdonnaye; Louvain and Namur were taken by General Valence; and the whole Austrian Netherlands, Luxembourg only excepted, fell into the hands of the French: Liege was taken on the 28th of November after a successful engagement, in which the Austrians lost 5 or 600 men and an immense train of artillery.

France was now in a situation not unusual in the history of those nations that either are free, or are attempting to become so; successful in all quarters abroad, but distracted by factions at home. The two parties in the convention were engaged in a struggle, which daily became more implacable. The party called the *Mountain* did not hesitate about the nature of the means they were to employ to bring about the ruin of their antagonists. They are even suspected of having, through the medium of Pache the war minister, retarded the supplies of the armies, to render the ruling party odious by want of success. They were for some time, however, unfortunate in this respect; and the daily news of victories supported with the public the credit of the Girondists. A new subject was therefore fallen upon, which was the question, how the dethroned king was to be disposed of? The moderate party wished to save him; and this was a sufficient reason for their antagonists to resolve upon his ruin. A committee was appointed to give in a report upon his conduct. A variety of accusations were brought against him; and the convention infamously resolved to act the part of accusers and of judges.

It was on the 11th of December when the ill-fated monarch was ordered to the bar of the convention: the king brought to act of accusation was read, and the king was summoned by the president, Barrere, to answer to each separate charge.

*Pres.* "Louis, the French nation accuses you of having committed a multitude of crimes to establish your tyranny, in destroying her freedom. You, on the 20th of June 1789, usurping the sovereignty of the people, by suspending the assemblies of their representatives, and expelling them with violence from the places of their sittings. This is proved in the process verbal entered at the Tennis-court of Versailles by the members of the constituent assembly. On the 23d of June you wanted to dictate laws to the nation; you surrounded their representatives with troops; you presented to them two royal declarations, subversive of all liberty, and ordered them to separate. Your own declarations, and the minutes of the assembly, prove these attempts. What have you to answer?"

*Louis.* "No laws were then existing to prevent me from it."

*Pres.* "You ordered an army to march against the citizens of Paris. Your satellites have shed the blood of several of them, and you would not remove this army till the taking of the Bastille and a general insurrection announced to you that the people were victorious. The

speeches

contests be-  
tween the  
Girondists  
and the  
Mountain.

141  
The king  
brought to  
trial.

French Revolution, 1792. speeches you made on the 9th, 12th, and 14th, of July to the deputations of the constituent assembly, show what were your intentions; and the massacres of the Tuilleries rise in evidence against you.—What have you to answer?"

*Louis.* "I was master at that time to order the troops to march; but I never had an intention of shedding blood."

*Pres.* "After these events, and in spite of the promises which you made on the 15th in the constituent assembly, and on the 17th in the town-house of Paris, you have persisted in your projects against national liberty. You long eluded the execution of the decrees of the 11th of August, respecting the abolition of personal servitude, the feudal government, and taxes: you long refused acknowledging the rights of man; you doubled the number of the life-guards, and called the regiment of Flanders to Versailles; you permitted, in orgies held before your eyes, the national cockade to be trampled under foot, the white cockade to be hoisted, and the nation to be endangered. At last, you rendered necessary a fresh insurrection, occasioned the death of several citizens, and did not change your language till after your guards had been defeated, when you renewed your perfidious promises. The proofs of these facts are in your observations of the 18th of September, in the decrees of the 11th of August, in the minutes of the constituent assembly, in the events of Versailles of the 5th and 6th of October, and in the conversation you had on the same day with a deputation of the constituent assembly, when you told them you would enlighten yourself with their councils, and never recede from them.—What have you to answer?"

*Louis.* "I have made the observations which I thought just on the two first heads. As to the cockade, it is false; it did not happen in my presence."

*Pres.* "You took an oath at the federation of the 14th of July, which you did not keep. You soon tried to corrupt the public opinion, with the assistance of Talon, who acted at Paris, and Mirabeau who was to have acted at Varennes, in order to prevent revolutionary movements in the provinces.—What have you to answer?"

*Louis.* "I do not know what happened at that time; but the whole is anterior to my acceptance of the constitution."

*Pres.* "You lavished millions of money to effect this corruption, and you would even use popularity as a means of enslaving the people. These facts are the result of a memorial of Talon, on which you have made your marginal comments in your own hand writing, and of a letter which Laporte wrote to you on the 10th of April; in which, recapitulating a conversation he had with Rivarol, he told you that the millions which you had been prevailed upon to throw away had been productive of nothing. For a long time you had meditated on a plan of escape. A memorial was delivered to you on the 28th of February, which pointed out the means for you to effect it; you approve of it by marginal notes.—What have you to answer?"

*Louis.* "I felt no greater pleasure than that of relieving the needy: this proves no design."

*Pres.* "On the 28th a great number of the nobles and military came into your apartments in the castle of the Tuilleries to favour that escape: you wanted to

quit Paris on the 10th of April to go to St Cland.—What have you to answer?"

*Louis.* "This accusation is absurd."

*Pres.* "But the resistance of the citizens made you sensible that their distrust was great; you endeavoured to discard it by communicating to the constituent assembly a letter, which you addressed to the agents of the nation near foreign powers, to announce to them that you had freely accepted the constitutional articles, which had been presented to you; and, notwithstanding, on the 21st you took flight with a false passport. You left behind a protest against these self-same constitutional articles; you ordered the ministers to sign none of the acts issued by the National Assembly; and you forbade the minister of justice to deliver up the seals of state. The public money was lavished to ensure the success of this treachery, and the public force was to protect it. Under the orders of Bouillé, who shortly before had been charged with the massacre of Nancy, and to whom you wrote on this head, "to take care of his popularity, because it would be of service to you." These facts are proved by the memorial of the 23d of February with marginal comments in your own hand-writing; by your declaration of the 20th of June, wholly in your own hand-writing; by your letter of the 4th of September 1790 to Bouillé; and by a note of the latter, in which he gives you an account of the use he made of 993,000 livres, given by you, and employed partly in trepanning the troops who were to escort you.—What have you to answer?"

*Louis.* "I have no knowledge whatever of the memorial of the 23d of February. As to what relates to my journey to Varennes, I appeal to my declaration to the commissaries of the constituent assembly at that period."

*Pres.* "After your detention at Varennes, the exercise of the executive power was for a moment suspended in your hands, and you again formed a conspiracy. On the 17th of July the blood of citizens was shed in the Champ de Mars. A letter in your own hand-writing, written in 1790 to La Fayette, proves that a criminal coalition subsisted between you and La Fayette, to which Mirabeau acceded. The revision began under these cruel auspices; all kinds of corruptions were made use of. You have paid for libels, pamphlets, and newspapers, designed to corrupt the public opinion, to discredit the assignats, and to support the cause of the emigrants. The registers of Septeuil show what immense sums have been made use of in these libticide manoeuvres.—What have you to answer?"

*Louis.* "What happened on the 17th of July has nothing at all to do with me. I know nothing of it."

*Pres.* "You seemed to accept the constitution on the 14th of September; your speeches announced an intention of supporting it, and you were busy in overturning it, even before it was completed. A convention was entered into at Pilnitz, on the 24th of July, between Leopold of Austria and Frederic-William of Brandenburg, who pledged themselves to re-erect in France the throne of an absolute monarchy, and you were silent upon this convention till the moment when it was known by all Europe.—What have you to answer?"

*Louis.* "I made it known as soon as it came to my knowledge; besides, every thing that refers to this subject concerns the minister."

*Pres.*

French  
Revolution,  
1792.

*Pref.* "Arles had hoisted the standard of rebellion; you favoured it by sending three civil commissaries, who made it their business not to repress the counter-revolutionists, but to justify their proceedings.—What have you to answer?"

*Louis.* "The instructions which were given to the commissaries must prove what was their mission; and I knew none of them when the ministers proposed them to me."

*Pref.* "Avignon, and the county of Venaissin, had been united with France; you caused the decree to be executed; but a month after that time civil war desolated that country. The commissaries you sent thither helped to ravage it.—What have you to answer?"

*Louis.* "I do not remember what delay has been caused in the execution of the decree; besides, this occurrence has no personal reference to me; it only concerns those that have been sent, not those who sent them."

*Pref.* "Nîmes, Montauban, Mende, Jales, felt great shocks during the first days of freedom. You did nothing to stifle those germs of counter-revolution till the moment when Saillant's conspiracy became manifestly notorious.—What have you to answer?"

*Louis.* "I gave, in this respect, all the orders which were proposed to me by the ministers."

*Pref.* "You sent 22 battalions against the Marseillais, who marched to reduce the counter-revolutionists of Arles.—What have you to answer?"

*Louis.* "I ought to have the pieces referring to this matter, to give a full answer."

*Pref.* "You gave the southern command to Wittgenstein, who wrote to you on the 21st of April 1792, after he had been recalled: 'A few instants more, and I shall call around the throne of your majesty thousands of French, who are again become worthy of the wishes you form for their happiness.'—What have you to answer?"

*Louis.* "This letter is dated since his recall; he has not been employed since. I do not recollect this letter."

*Pref.* "You paid your late life-guards at Coblenz; the registers of Septeuil attest this; and general orders signed by you prove that you sent considerable remittances to Bouillé, Rochefort, Vauguyon, Choiseul, Beaupre, Hamilton, and the wife of Polignac.—What have you answer?"

*Louis.* "When I first learned that my life-guards assembled beyond the Rhine, I stopped their pay: as to the rest, I do not remember."

*Pref.* "Your brothers, enemies to the state, caused the emigrants to rally under their banners: they raised regiments, took up loans, and concluded alliances in your name: you did not disclaim them; but at the moment when you were fully certain that you could no longer cross their projects, your intelligence with them by a note, written by Louis Stanislaus Xavier, signed by your two brothers, was conceived in these words:

'I wrote to you, but it was by post, and I could say nothing. We are two here, who make but one; one in sentiments, one in principles, one in zeal of serving you. We keep silence; because, were we to break it too soon, it would injure you: but we shall speak as soon as we shall be certain of general support, and that moment is near. If we are spoken to on the

part of those people, we shall hear nothing; but if on your part, we will listen: we shall pursue our road straight. It is therefore desired that you will enable us to say something. Do not stand on ceremonies. Be easy about your safety: we only exist to serve you: we are eagerly occupied with this point, and all goes on well; even our enemies feel themselves too much interested in your preservation to commit an useless crime which would terminate in their own destruction. Adieu.

' L. S. XAVIER and  
' CHARLES PHILIPPE.'

"What have you to answer?"

*Louis.* "I disowned all the proceedings of my brothers, according as the constitution prescribed me to do, and from the moment they came to my knowledge. Of this note I know nothing."

*Pref.* "The soldiers of the line, who were to be put on the war establishment, consisted but of 100,000 men at the end of December, you therefore neglected to provide for the safety of the state from abroad. Narbonne required a levy of 50,000 men, but he stopped the recruiting at 26,000, in giving assurances that all was ready; yet there was no truth in these assurances. Servan proposed after him to form a camp of 20,000 men near Paris; it was decreed by the legislative assembly; you refused your sanction.—What have you to answer?"

*Louis.* "I had given to the ministers all the orders for expediting the augmentation of the army: in the month of December last, the returns were laid before the assembly. If they deceived themselves, it is not my fault."

*Pref.* "A flight of patriotism made the citizens repair to Paris from all quarters. You issued a proclamation, tending to stop their march; at the same time our camps were without soldiers. Dumourier, the successor of Servan, declared that the nation had neither arms, ammunition, nor provisions, and that the posts were left defenceless. You waited to be urged by a request made to the minister Lajard, when the legislative assembly wished to point out the means of providing for the external safety of the state, by proposing the levy of 43 battalions. You gave commission to the commanders of the troops to disband the army, to force whole regiments to desert, and to make them pass the Rhine, to put them at the disposal of your brothers, and of Leopold of Austria, with whom you had intelligence. This fact is proved by the letter of Toulougeon, governor of Franche Comté.—What have you to answer?"

*Louis.* "I know nothing of this circumstance; there is not a word of truth in this charge."

*Pref.* "You charged your diplomatical agents to favour this coalition of foreign powers and your brothers against France, and especially to cement the peace between Turkey and Austria, and to procure thereby a larger number of troops against France from the latter. A letter of Choiseul Gouffier, ambassador at Constantinople, verifies the fact.—What have you to answer?"

*Louis.* "M. Choiseul did not speak the truth: no such thing has ever been."

*Pref.* "The Prussians advanced against our frontiers: your minister was summoned on the 8th of July to give an account of the state of our political relations with

French  
Revolution,  
1792.

French Revolution, 1792. with Prussia; you answered, on the 10th, that 50,000 Prussians were marching against us, and that you gave notice to the legislative body of the formal acts of the pending hostilities, in conformity to the constitution.—What have you to answer?"

*Louis.* "It was only at that period I had knowledge of it: all the correspondence passed with the ministers."

*Pres.* "You intrusted Dabancourt, the nephew of Calonne, with the department of war; and such has been the success of your conspiracy, that the posts of Longwy and Verdun were surrendered to the enemy at the moment of their appearance.—What have you to answer?"

*Louis.* "I did not know that Dabancourt was M. Calonne's nephew. I have not directed the posts. I would not have permitted myself such a thing. I know nothing of it, if it has been so."

*Pres.* "You have destroyed our navy—a vast number of officers belonging to that corps had emigrated; there scarcely remained any to do duty in the harbours; meanwhile Bertrand was granting passports every day; and when the legislative body represented to you his criminal conduct on the 8th of March, you answered, that you were satisfied with his services.—What have you to answer?"

*Louis.* "I have done all I could to retain the officers. As to M. Bertrand, since the legislative assembly presented no complaint against him that might have put him in a state of accusation, I did not think proper to turn him out of office."

*Pres.* "You have favoured the maintenance of absolute government in the colonies; your agents fomented troubles and counter-revolutions throughout them, which took place at the same epoch when it was to have been brought about in France, which indicates plainly that your hand laid this plot.—What have you to answer?"

*Louis.* "If there are any of my agents in the colonies, they have not spoken the truth: I had nothing to do with what you have just mentioned."

*Pres.* "The interior of the state was convulsed by fanaticism; you avowed yourself their protector, in manifesting your evident intention of recovering by them your ancient power.—What have you to answer?"

*Louis.* "I cannot answer to this; I know nothing of such a project."

*Pres.* "The legislative body had passed a decree on the 29th of January against the factious priests; you suspended its execution.—What have you to answer?"

*Louis.* "The constitution reserved to me the free right to refuse my sanction of the decrees."

*Pres.* "The troubles had increased; the minister declared, that he knew no means in the laws extant to arraign the guilty. The legislative body enacted a fresh decree, which you likewise suspended.—What have you to say to this?"

[Louis replied in the same manner as in the preceding charge.]

*Pres.* "The uncitizen-like conduct of the guards whom the constitution had granted you, had rendered it necessary to disband them. The day after, you sent them a letter expressive of your satisfaction, and con-

tinued their pay. This fact is proved by the treasurer of the civil list.—What have you to answer?"

*Louis.* "I only continued them in pay till fresh ones could be raised, according to the tenor of the decree."

*Pres.* "You kept near your person the Swiss guards: the constitution forbade you this, and the legislative assembly had expressly ordained their departure.—What have you to answer?"

*Louis.* "I have executed all the decrees that have been enacted in this respect."

*Pres.* "You had private companies at Paris, charged to execute movements useful to your projects of a counter-revolution. Dangremont and Gilles were two of your agents, who had salaries from the civil list. The receipts of Gilles, who was ordered to raise a company of 60 men, shall be presented to you.—What have you to answer?"

*Louis.* "I have no knowledge whatever of the projects laid to their charge: the idea of a counter-revolution never entered into my mind."

*Pres.* "You wished to suborn, with considerable sums, several members of the legislative and constituent assemblies. Letters from St Leon and others evince the reality of these deeds.—What have you to answer?"

*Louis.* "Several persons presented themselves with similar decrees, but I have waved them."

*Pres.* "Who are they that presented you with those projects?"

*Louis.* "The plans were so vague that I do not recollect them now."

*Pres.* "Who are those to whom you gave money?"

*Louis.* "I gave money to nobody."

*Pres.* "You suffered the French name to be reviled in Germany, Italy, and Spain, since you omitted to demand satisfaction for the bad treatment which the French suffered in those countries.—What have you to answer?"

*Louis.* "The diplomatic correspondence will prove the contrary; besides, this was a concern of the ministers."

*Pres.* "You reviewed the Swiss on the 10th of August at five o'clock in the morning; and the Swiss were the first who fired upon the citizens."

*Louis.* "I went on that day to review all the troops that were assembled about me; the constituted authorities were with me, the department, the mayor, and municipality; I had even invited thither a deputation of the national assembly, and I afterwards repaired into the midst of them with my family."

*Pres.* "Why did you draw troops to the castle?"

*Louis.* "All the constituted authorities saw that the castle was threatened; and as I was a constituted authority, I had a right to defend myself."

*Pres.* "Why did you summon the mayor of Paris in the night between the 9th and 10th of August to the castle?"

*Louis.* "On account of the reports that were circulated."

*Pres.* "You have caused the blood of the French to be shed."

*Louis.* "No, Sir, not I."

*Pres.* "You authorized Septeuil to carry on a considerable

French Revolution, 1792.

French Revolution, 1792. considerable trade in corn, sugar, and coffee, at Ham-burg. The fact is proved by a letter of Septeuil."

Louis. "I know nothing of what you say."

Pres. "Why did you affix a *veto* on the decree which ordained the formation of a camp of 20,000 men?"

Louis. "The constitution left me the free right of refusing my sanction of the decrees; and even from that period I had demanded the assemblage of a camp at Soissons."

President, addressing the convention. "The questions are done with."—(To Louis).—"Louis, is there any thing that you wish to add?"

Louis. "I request a communication of the charges which I have heard, and of the pieces relating thereto, and the liberty of choosing counsel for my defence."

Valazé, who sat near the bar, presented and read to Louis Capet the pieces, viz. The memoir of Laporte and Mirabeau, and some others, containing plans of a counter-revolution.

Louis. "I disown them."

Valazé next presented several other papers, on which the act of accusation was founded, and asked the king if he recognized them. These papers were the following:

Valazé. "Letter of Louis Capet, dated June 29th 1790, settling his connexions with Mirabeau and La Fayette to effect a revolution in the constitution."

Louis. "I reserve to myself to answer the contents."—Valazé read the letter.)—"It is only a plan, in which there is no question about a counter-revolution; the letter was not to have been sent."

Valazé. "Letter of Louis Capet, of the 22d of April, relative to conversations about the Jacobins, about the president of the committee of finances, and the committee of domains; is dated by the hand of Louis Capet."

Louis. "I disown it."

Valazé. "Letter of Laporte, of Thursday morning, March 3d, marked in the margin in the hand-writing of Louis Capet with March 3d 1791, implying a pretended rupture between Mirabeau and the Jacobins."

Louis. "I disown it."

Valazé. "Letter of Laporte without date, in his hand-writing, but marked in the margin by the hand of Louis Capet, containing particulars respecting the last moments of Mirabeau, and expressing the care that had been taken to conceal from the knowledge of men some papers of great concern which had been deposited with Mirabeau."

Louis. "I disown it as well as the rest."

Valazé. "Plan of a constitution, or revision of the constitution, signed La Fayette, addressed to Louis Capet, April 6. 1790, marked in the margin with a hue in his own hand-writing."

Louis. "These things have been blotted out by the constitution."

Valazé. "Do you know this writing?"

Louis. "I do not."

Valazé. "Your marginal comments?"

Louis. "I do not."

Valazé. "Letter of Laporte of the 19th of April, marked in the margin by Louis Capet April 19. 1791, mentioning a conversation with Rivarol."

Louis. "I disown it."

Valazé. "Letter of Laporte, marked April 16. 1791, in which it seems complaints are made of Mirabeau, the abbé Perigord, André, and Beaumetz, who do not seem to acknowledge sacrifices made for their sake."

Louis. "I disown it likewise."

Valazé. "Letter of Laporte of the 23d of February 1791, marked and dated in the hand-writing of Louis Capet; a memorial annexed to it, respecting the means of his gaining popularity."

Louis. "I know neither of these pieces."

Valazé. "Several pieces without signature, found in the castle of the Thuilleries, in the gap which was that in the walls of the palace, relating to the expenses to gain that popularity."

President. "Previous to an examination on this subject, I wish to ask a preliminary question: Have you caused a press with an iron door to be constructed in the castle of the Thuilleries, and had you your papers locked up in that press?"

Louis. "I have no knowledge of it whatever."

Valazé. "Here is a day-book written by Louis Capet himself, containing the pensions he has granted out of his coffer from 1776 till 1791, in which are observed some douceurs granted to Acton."

Louis. "This I own, but it consists of charitable donations which I have made."

Valazé. "Different lists of sums paid to the Scotch companies of Noailles, Gramont, Montmorency, and Luxembourg, on the 9th of July 1791."

Louis. "This is prior to the epoch when I forbade them to be paid."

Pres. "Louis, where had you deposited those pieces which you own?"

Louis. "With my treasurer."

Valazé. "Do you know these pension lists of the life-guards, the one hundred Swiss, and the king's guards for 1792?"

Louis. "I do not."

Valazé. "Several pieces relative to the conspiracy of the camp of Jales, the originals of which are deposited among the records of the department of L'Ar-dèche."

Louis. "I have not the smallest knowledge of them."

Valazé. "Letter of Bouillé, dated Mentz, bearing an account of 993,000 livres received of Louis Capet."

Louis. "I disown it."

Valazé. "An order for payment of 168,000 livres, signed Louis, indorsed Le Bonneirs, with a letter and billet of the same."

Louis. "I disown it."

Valazé. "Two pieces relative to a present made to the wife of Polignac, and to Lavauguyon and Choiseul."

Louis. "I disown them as well as the others."

Valazé. "Here is a note signed by the two brothers of the late king, mentioned in the declaratory act."

Louis. "I know nothing of it."

Valazé. "Here are pieces relating to the affair of Choiseul-Gouffier at Constantinople."

Louis. "I have no knowledge of them."

Valazé,

French  
Revolution,  
1792.

*Valazé.* "Here is a letter of the late king to the bishop of Clermont, with the answer of the latter, of the 16th of April 1791."

*Louis.* "I disown it."

*President.* "Do you not acknowledge your writing and your signet?"

*Louis.* "I do not."

*President.* "The seal bears the arms of France."

*Louis.* "Several persons made use of that seal."

*Valazé.* "Do you acknowledge this list of sums paid to Gilles?"

*Louis.* "I do not."

*Valazé.* "Here is a memorandum for indemnifying the civil list for the military pensions; a letter of Dufresne St Leon, which relates to it."

*Louis.* "I know none of these papers."

142  
He is allowed to nominate his own counsel;

When the whole had been investigated in this manner, the president, addressing the king, said, "I have no other questions to propose. Have you any thing more to add in your defence? I desire to have a copy of the accusations (reproduced king), and of the papers on which it is founded. I also desire to have a counsel of my own nomination." Herrewé informed him, that the two first requests were already decreed, and that the deliberation respecting the other would be made known to him in due time.

It would have been an stroke of cruelty to refuse a request so reasonable in itself; it was therefore decreed that counsel should be allowed to the king, and his choice fell upon M. M. Tronchet, Lamoignon Maleherbes, and Defezé; he had previously applied to M. Defezé, who excused himself on account of his age and infirmity. On the 21st of December, the king appeared for the last time to the bar of the convention; and the defence was a defence which the counsel had prepared, and which was greatly admired for the solidity of the argument and the beauty of the composition.

When the defence was finished, the king arose, and holding a paper in his hand, pronounced in a calm manner the following words: "Citizens, you have heard the defence of Louis, the king, perhaps for the last time, but I have not yet said what I have to say to you. I have nothing to say but the truth. My conscience reproaches me with nothing; I never was guilty of having my conduct investigated; but I suffered from your want of confidence, that I was accused of crimes which I never committed, the blood of the people on the guillotine. The proofs I have given through the mouth of a necessary disposition, I hoped would have cleared me from an imputation, which I now know to be entirely groundless."

143  
but is condemned to death by a small majority;

The discussion was fatally closed on the 21st of January. After a sitting of near 94 hours, the punishment of death was awarded by a small majority of the convention, and several of these differed in opinion from the rest, respecting the time when it should be inflicted; some contending that it should not be put in execution till after the end of the war, while others proposed to take the sense of the people, by referring the sentence to the primary assemblies.

M. Defezé then solemnly invoked the assembly in the name of his colleagues, to consider by what a small majority the punishment of death was pronounced against the dethroned monarch. "Do not afflict France (added this eloquent advocate) by a judgment that will appear terrible to her, when five voices only were

VOL. XVI. Part I.

presumed sufficient to carry it." He appealed to eternal justice, and sacred humanity, to induce the convention to refer their sentence to the tribunal of the people. "You have either forgotten or destroyed (said the celebrated M. Tronchet) the lenity which the law allows to criminals, of requiring at least two-thirds of the voices to constitute a definitive judgment."

The sentence was ordered to be executed in twenty-four hours.

The king and his family had been for some time kept separate from each other; but he was now allowed to see them, and to choose an ecclesiastic to attend him. The king, and, above all, the separation from his family, was tender in the extreme. On Monday the 21st January, at eight o'clock in the morning, the unfortunate monarch was summoned to his fate. He ascended the guillotine with a firm air and step. Raising his voice, he said, "Frenchmen, I die innocent; I pardon all my enemies; and may France"—at this instant the inhuman executioners ordered the drums to beat, and the executioners to perform their office. When they offered to bind his hands, he started back as if about to resist; but recollected himself in a moment, and submitted. When the instrument of death descended, the priest exclaimed, "Son of St Louis, ascend to heaven." The bleeding head was held up, and a few of the populace shouted *Vive la République*. His body was interred in a grave that was filled up with quicklime, and a guard placed around till it should be consumed.

Thus fell Louis XVI. He possessed from nature a good understanding, which, however, was blunted by the early indulgences of a court. He had a strong sense of justice, and his humanity was perhaps extreme. One defect rendered his virtues of little value, which was the possession of an irresolute and unsteady character. Unambitious, and easily advised, he was without difficulty induced to change his purposes, especially by his queen, whose connexion with the house of Austria had always tended to render his counsels unpopular. Whether he was or was not connected with the foreign invaders of his country, posterity must decide; but all men of sense and moderation must be convinced that he was murdered by a band of ruffians. Indeed a sentence so infamous, and in all respects unjust, is not to be found in the records of history. The greater part of the charges brought against him were trifling. Those which seem to be of importance relate to conduct authorized by the constitution under which he acted; and that constitution declared his person inviolable. The severest punishment that he could incur by law, was not death, but deposition; and there is no doubt, that in putting him to death the French nation broke the social compact which their representatives made with him. In a political view, this tragical event was injurious to the republican cause throughout Europe. No man out of France ventured to justify it; and in all countries it excited the most violent indignation against the rulers of the new republic.

New enemies were now hailing to join the general league against France. We do not mean here to enter into a detail of the political struggles that occurred in any other country, than that in the narrative of whole revolution we are now engaged. It will therefore only be necessary to remark in general, that the British government at this time thought itself endangered by the propagation of those speculative opinions which had

Britain.

overturned the French monarchy. Almost all the men of property in the kingdom concurred with the ministry in thinking a war with France necessary for the purpose of securing the constitution at home. After the 10th of August the British minister had been recalled; but the new republic still suffered the former ambassador from France, M. Chauvelin, to remain in England.

The offensive grounds of quarrel on the part of Great Britain were chiefly two; the decree of the 15th of November 1792, by which it was truly observed that encouragement to rebellion was held out to the subjects of every state, and that war was thereby waged against every established government. Of this decree the French executive council gave explanations, denying the falseness of the interpretation put upon it, and alleging that the intention of the convention was only to give aid to such countries as had already acquired their freedom, and by a declaration of the general will requested aid for its preservation. But this explanation cannot be admitted. The decree expressly says, that the French nation will grant assistance to all who wish to procure liberty; and when it is considered what their notions of liberty are, it cannot be doubted but that their intention was to excite rebellion in foreign nations. The second point of dispute referred to the opening of the Scheldt. This river runs from Brabant through the Dutch territory to the sea. The Dutch had shut up the mouth of it, and prevented any maritime commerce from being carried on by the people of Brabant by means of the river. To render themselves popular in Brabant, the French had declared, that they would open the navigation of the Scheldt. But Great Britain had some time before bound herself by treaty with the Dutch to assist them in obstructing this navigation, and now declared to the French, that the project of opening the Scheldt must be renounced if peace with Great Britain was to remain. The French alleged, that by the law of nations navigable rivers ought to be open to all who reside on their banks; but that the point was of no importance either to France or England, and even of very little importance to Holland; that if the people of Brabant themselves, chose to give it up, they would make no objection. It has been though remarkable, that the Dutch gave themselves no trouble about the matter. They did not ask the assistance of England; and with that coolness which is peculiar to their character, the merchants individually declared, that if the Scheldt was opened, they could manage their commerce as well at Antwerp as at Amsterdam. But in all this there is nothing strange. Among the Dutch were many republicans, who wished for the downfall of the stadtholder. They rejoiced at every thing which distressed him, or had a tendency to render his office useless in the eyes of the people. Others, who thought differently, were afraid to speak their sentiments, as Dumourier was in their neighbourhood with a victorious army. The result of the whole was, that M. Chauvelin was commanded by the British government to leave this country. The French executive council gave powers to another minister, M. Maret, to negotiate, and requested a passport for him; but he was not suffered to land. The haughty republicans having thus far humbled themselves before the British government, at last, on the 1st of February 1793, on the motion of Brissot, the national convention decreed, among other articles, that "George king of England had never ceased since the revolution

148  
War declared  
against  
the king of  
England  
and Stadtholder of  
Holland,

of the 10th of August 1792 from giving to the French nation proofs of his attachment to the concert of crowned heads; that he had drawn into the same lake the stadtholder of the United Provinces; that, contrary to the treaty of 1783, the English ministry had granted protection to the emigrants and others who have openly appeared in arms against France; that they have committed an outrage against the French republic, by ordering the ambassador of France to quit Great Britain; that the English have stopped divers boats and vessels laden with corn for France, whilst, at the same time, contrary to the treaty of 1786, they continue the exportation of it to other foreign countries; that to thwart more efficaciously the commercial transactions of the republic with England, they have by an act of parliament prohibited the circulation of assignats. The convention therefore declare, that in consequence of these acts of hostility and aggression, the French republic is at war with the king of England and the stadtholder of the United Provinces."

The absurdity of pretending that any treaty with France made in 1783 could be violated by protecting the emigrants who fled from the fury of the convention, must be obvious to every reader. The convention was itself a rebellious usurpation of the government with which such a treaty was made. The prohibition of assignats was certainly contrary to no law, and was sanctioned by every motive of expediency, unless the convention could prove that all nations were bound by the law of nature to risk their own credit upon the credit of the French republic.

About a fortnight after this abrupt declaration against Britain, war was likewise declared against Spain, and in the course of the summer France was at war with all Europe, excepting only Switzerland, Sweden, Denmark, and Turkey.

In the mean time General Dumourier, who was proceeding agreeably to his orders, made an attack upon Holland; but in doing this he displayed his courage in such a manner as to excite great animosity against him on the side of the Dutch. He commanded General Miranda to break through the Dutch lines, and to attack up Bruck and Bergen-op-Zoom. He fell at these places, viz. Bruck, on the 16th of February, and Klundert on the 26th; and Gertrudenberg on the 28th of March. The siege of Williamstadt and Bergen-op-Zoom were vigorously and successfully pressed. On the 1st of March General Clairfait having passed the Scheldt, attacked the French posts and compelled them to retreat with the loss of 2000 men.

The following day the archduke attacked them anew with considerable success. On the 3d the French were driven from Kik-la-Chapelle, with the loss of 4000 men killed and 1500 taken prisoners.

The siege of Maestricht was now raised, and the French retreated to Tongres, where they were also attacked and forced to retreat to St Tron. Dumourier here joined them, but did not bring his army along with him from the attack upon Holland. After some skirmishes a general engagement took place at Neerwinden. It was fought on the part of the French with great obstinacy; but they were at length overpowered by the number of their enemies, and perhaps also by the treachery of their commander. This defeat was fatal. The French lost 3000 men, and 6000 immediately

149

152  
And joining  
the allies:

immediately deserted and went home to France. Dumourier continued to retreat, and on the 22d he was again attacked near Louvain. He now, through the medium of Colonel Mack, came to an agreement with the Imperialists that his retreat should not be seriously interrupted. It was now fully agreed between him and the Imperialists, that while the latter took possession of Condé and Valenciennes, he should march to Paris, dissolve the convention, and place the son of the late king upon the throne.

The rapid retreat and successive defeats of General Dumourier rendered his conduct suspicious. Commissioners were sent from the executive power for the purpose of discovering his designs. They dissembled, and pretended to communicate to him a scheme of a counter-revolution. He confessed his intention of dissolving the convention and the Jacobin club by force, which he said would not exist three weeks longer, and of restoring monarchy. On the report of these commissioners the convention sent Bernabée the minister of war to supersede and arrest Dumourier, along with Camille, Blanquet, La Marquise, and Quinette, as commissioners. The attempt on the part of these men was at least hazardous, so far as more of it; and the result was, that on the 1st of April Dumourier sent them

convention  
in chief.

prisoners to General Clairfaut's headquarters at Tonnay, as hostages for the safety of the royal family. He next attempted to seduce his army from their fidelity to the convention; but he speedily found that he had much mistaken the character of his troops. Upon the report that their general was to be carried as a criminal to Paris, they were seized with sudden indignation; but when they found that an attempt was making to prevail upon them to march against their country, they refused to do so. On the 4th of April two thousand of the convention were killed; and by General Dumourier, Imperialists, and the army of the Rhine, declaring that they would not obey any people who to restore the constitution were to march against and arrest. Prince Cobourg announced that he would co-operate with the Imperialists to bring to France her constitutional king, and that he had formed for himself a declaration of independence, which he came not to the French territory for the purpose of making conquests. On the same day Dumourier sent to the advanced guard of his own army at Valenciennes, and there learned that the corps of artillery had deserted their general, and were marching to the Rhine. He soon found that the whole army had deserted to stand by their country. About 8000 men and 800 infantry was the whole number of soldiers who deserted with Dumourier to the Austrians, and many of them afterwards returned.

155  
State of  
France at  
this period.

By the defection of Dumourier, however, the whole army of the north was dissolved, and in part disbanded, in presence of a numerous, well-disciplined, and victorious enemy. The Prussians were at the same time advancing on the Rhine with an immense force, and about to commence the siege of Mentz. In the interior of the republic more serious evils if possible were arising. In the departments of La Vendée and La Loire, or the provinces of Brittany and Poitou, immense multitudes of emigrants and other royalists had gradually assembled in the course of the winter. They professed to act in the name of Monsieur as regent of France.

French  
Revolution,  
1793.

156  
Congress of  
the combined  
powers.

About the middle of March they advanced against Nantz to the amount of 40,000. In the beginning of April they defeated the republicans in two pitched battles, and possessed themselves of 50 leagues of country. They even threatened by their own efforts to shake the new republic to its foundation. On the 8th of April a congress of the combined powers assembled at Antwerp. It was attended by the prince of Orange and his two sons, with his excellency Vander Spiegel, on the part of Holland; by the duke of York and Lord Auckland on the part of Great Britain; by the prince of Saxe-Coburg, Counts Metterinch, Starenski, and Prince Bismarck, with the Prussian, Spanish, and Neapolitan envoys. It was here determined to commence active operations against France. The prince of Coburg's proclamation was recalled, and a solemn manifesto announced.

Commissioners from the convention now set up the republic anew, and the scattered battalions rallied around it. General Dampierre was appointed commander, and on the 13th he was able to repel a general attack upon his advanced posts. On the 14th, his advanced guard yielded to a superior number, but on the 15th was victorious in a long and well-fought battle. On the 23d the Austrians were again repulsed, and on the first of May General Dampierre was himself repulsed in an attack upon the enemy. On the 8th another engagement took place, in which the French general was killed by a cannon ball. On the 23d a very determined attack was made by the allies upon the French fortified camp of Famars, which covered the town of Valenciennes. The French were overcome, and in the night abandoned their camp. In consequence of this the allies were enabled to commence the siege of Valenciennes; for Condé had been blockaded from the 1st of April.

About the same time General Custine on the Rhine made a violent but unsuccessful attack upon the Prussians, in consequence of which they were soon enabled to lay siege to Mentz. The Corsican general Paoli revolted at this period; and the new republic, assaulted from without by the whole strength of Europe, was undermined by treachery and faction within.

While the country was in a state verging upon utter ruin, parties in the convention were gradually waxing more fierce in their animosity; and regardless of what was passing at a distance, they seemed only anxious for the extermination of each other. In the month of March, the celebrated *Revolutionary Tribunal* was established for the purpose of trying crimes committed against the state; and the Girondist party, the mildness of whose administration, had contributed not a little to increase the evils of their country, began to see the necessity of adopting measures of severity. But the public calamities, which now rapidly followed each other in succession, were ascribed by their countrymen to their imbecility or perfidy. This gave to the party of the *Mountain*, a fatal advantage. On the 15th of April the communes of the 48 sections of Paris presented a petition, requiring that the chiefs of the Girondists therein named should be impeached and expelled from the convention. This was followed up on the 1st of May by another petition from the suburb of St Antoine. The Girondist party in the mean time impeached Marat, but he was acquitted by the jury at his trial. The

Condé and Valenciennes.

rious in the cause of republicanism. No regard, however, has been paid to it by the convention, which has declared itself permanent, nor indeed does it seem possible to carry it into execution.

We have mentioned that Condé was invested from the beginning of April. It did not yield till the 10th of July, when the garrison was so much reduced by famine and disease, that out of 4000 men, of which it originally consisted, only 1500 were fit for service. The eyes of all Europe were in the mean time fixed upon the siege of Valenciennes. Colonel Monnier had contended, that batteries ought immediately to be placed under the walls without approaching it by regular parallels; but the Imperial engineer Mr. Freytag insisted, that the work of the great Vauban must be treated with more respect; and his opinion was adopted by the council of war. The trenches were commenced on the 14th of June. Few sallies were made by the garrison, on account of the smallness of their numbers. The inhabitants at first withstood the violence of the bombardment, but were gradually compelling or giving much trouble to the besiegers. General Ferrand, the governor of the town, at the instigation of the Imperial engineers, ordered the town to be surrendered on the 27th of July by capitulation to the Duke of York, who took possession of it in the name of the Emperor of Germany. The siege of Condé was at the same time going on. It lasted till the 1st of August, when it was taken after an unsuccessful attempt to storm it. The Rhine for its relief, was cut off on the 28th of July.

The fall of Valenciennes was a loss how to provide for the want of the French army. The convention had to have their eyes turned to the Rhine, and the danger of a fall into the hands of the Austrians. The convention was in a state of confusion, and the army was in a state of disorganization. The Duke of York, who had taken the town, was in a state of confusion, and the army was in a state of disorganization.

166  
Unfortunate consequences of the division of their forces.

It is told that the Duke of York, in his correspondence with General Freytag, had been taken of his treachery. On the 27th of July, the Duke of York attacked and drove the French into the town, after an action in which the general Dalton was killed. A naval armament was expected from Great Britain to co-operate in the siege, but it did not arrive. In the mean time, a strong republican force menaced the covering army of the allies, which was commanded by General Freytag. His was soon attacked and totally routed. The siege was raised. The British lost their heavy cannon and baggage, with several thousand men; and the convention, believing that their general Houchard could have cut off the Duke of York's retreat, tried and executed him for this neglect of duty.

French Revolution, 1793.

Prince Cobourg and General Clairfait in the mean time unsuccessfully attempted to besiege Cambray and Bouchain. Quenoy was, however, taken by General Clairfait on the 11th of September; and here finally terminated for the present campaign the success of the allies in the Netherlands.

A considerable part of the French army of the north took a strong position near Maubeuge, where they were blockaded by Prince Cobourg; but upon the 28th of September he was repeatedly attacked by the French troops under General Jourdan, who defeated them. The French had now reorganised their army, and brought into the field a considerable body of artillery, in which were many 24 pounders. The French threatened the fearful, and appeared to be invincible. Crowds of women, without confusion, passed through the ranks distributing spirituous liquors, and carrying off the wounded. The attacks were repeated and terrible on both sides; but the Austrians had considerably the disadvantage, and Prince Cobourg retired during the night. The French now menaced maritime Flanders. They took Namur and besieged Nieupoort. A detachment of British troops ready to sail to the West Indies were hastily sent to Ostend, and prevented for the present the further progress of the French.

Such was the multiplicity of the events that now occurred in France, that it is difficult to state the outlines of them with any tolerable perspicuity. We have already mentioned the extensive dissensions that occurred throughout the republic in consequence of the triumph of the Mountain party on the 31st of May. The department of Calvados was first in arms against the convention under the command of General Felix Wimpfen; but before the end of July the insurrection was quieted, after a few slight skirmishes. But the federalism of the cities of Marseilles, Lyons, and Toulon, still remained. Lyons was attacked on the 8th of August by the conventional troops. Several actions followed, which were attended with great loss both on the part of the assailants and of the besieged. The city was reduced almost to ruins; but it held out during the whole month of September. The besieging General Kellerman was removed from his command, on account of his supposed inactivity; and the city surrendered on the 8th of October to General Doppet, a man who had lately been a physician. Such was the rage of party spirit at this time, that the walls and public buildings of Lyons were ordered to be destroyed, and its name changed to that of *Ville Affranchie*. Many hundreds of its citizens were dragged to the scaffold on account of their alleged treasonable resistance to the convention. The victorious party, wearied by the slow operation of the guillotine, at last destroyed their prisoners in multitudes, by firing grape-shot upon them. Such indeed was the unrelenting character of the Mountain at this time, not only here but through the whole republic, that they themselves pretended not to excuse it, but declared that terror was with them the order of the day.

In the end of July General Cartaux was sent against Marseilles. In the beginning of August he gained some successes over the advanced federalist troops. On the 24th he took the town of Aix, and the Marseillais submitted.

167

Hood,

submitted. But the leading people of the important town and harbour of Toulon entered into a negotiation, and submitted to the British admiral Lord Hood, under condition that he should preserve as a depôt, the town and shipping for Louis XVII. and under the stipulation that he should assist in restoring the constitution of 1789. The siege of Toulon was commenced by General Cartaux in the beginning of September. It continued without much vigour during that and the whole of the succeeding month. Men of arms, Spanish, and English troops, were brought on as to assist in its defence. In the beginning of November, General Cartaux was removed to the command of the army of the Alps, and General Dugommier succeeded him. General O'Hara arrived with reinforcements from England, and took upon him the command of the army. On the 19th of November, the garrison made a general effort to destroy some batteries that were upon the heights which commanded the city. The British were surprised, and the allies succeeded completely in their object; but, elated by the facility of their conquest, the allied troops rushed forward in pursuit of the French enemy, contrary to their orders, and were unexpectedly met by a strong French force that was drawn out to protect the fugitives. General O'Hara now came from the city to endeavour to bring off his troops with regularity. He was wounded in the arm and taken prisoner. The total loss of the allies in this affair was estimated at nearly one thousand men. The French had now mustered in full force at Toulon, and prepared for the attack. It was begun on the 19th of December in the morning, and was chiefly directed against Fort Malgrave, defended by the British. This fort was protected by an intrenched camp, 13 pieces of cannon, 36 and 24 pounders, &c. 5 mortars, and 3000 troops. Such was the ardour of assault, that it was carried in an hour, and the whole garrison was destroyed or taken. The allies now found it impossible to defend the place; and in the course of the day embarked their troops, after having set on fire the arsenal and ships. A scene of confusion here ensued, such as has not been known in the history of modern wars. Crowds of people of every rank, age, and sex, hurried on board the ships, to avoid the vengeance of their enraged countrymen. Some of the inhabitants began to jump upon their late allies; others in despair were plunging into the sea, making a vain effort to reach the ships; or putting an end at once to their own existence upon the shore. Thirty-one ships of the line were found by the British at Toulon; thirteen were left behind; ten were burnt; four had been sent to the French ports of Brest and Rochefort, and 5000 republicans who could not be trusted, and Great Britain finally obtained by this expedition three ships of the line and five frigates.

On the side of Spain the war produced nothing of importance; and in the mountainous country of Piedmont it went on slowly. Nice and Chambery were still retained by the French; but more terrible scenes were acting in other quarters. In La Vendée a most bloody war was perpetuated by the royalists. In that quarter of the country the language of the rest of France is little understood. The people were superstitious, and had acquired little idea of the new opinions that had

lately been propagated in the rest of the empire. They were chiefly headed by priests, and regarded their cause as a religious one. Their mode of warfare usually was, to go on in their ordinary occupations as peaceable citizens, and suddenly to assemble in immense bands, inasmuch that at one time they were said to amount to 150,000 men. They besieged Nantz and the city of Orleans, and even Paris itself was not thought altogether safe from their enterprises. The war was inconceivably bloody. Neither party gave quarter; and La Vendée proved a dreadful drain to the population of France. On the 28th of June, the conventional general broke the royalists from Lucon; and Nantz was taken by General Beysser. After some success, General Bickerman was surprised by them, and compelled to retreat to Parthenay. In the beginning of August, the royalists were defeated by General Rossignol. On the 25th of that month, under Charette their principal chief, they again attacked Nantz, but were repulsed. It would be tedious to give a minute detail of this obscure but cruel war. The royalists were often defeated and becomingly dispersed, but as often broke in again, and the struggle continued. At last, however, in the month of October, they were completely defeated, driven from La Vendée, and forced to divide into separate bands. One of these bands, it is said, the Duke of Angoulême, where they were subdued; another took the road of Maine and Brittany, where they struggled some time against their enemies, and were at last cut to pieces or dispersed.

The royalists had long expected to see the Duke of Angoulême land; and an armament under the Duke of Angoulême actually fitted out for that purpose, but it did not arrive till too late, and returned, some distant accounts landing. The Duke of Angoulême, however, succeeded by a small party, and the Duke of Angoulême and his history would almost seem to contain more than to state in detail the circumstances of the war, and the success of the royalists against the republicans. The Duke of Angoulême, however, was not the only royalist leader; and the Duke of Angoulême, however, was not the only royalist leader; and the Duke of Angoulême, however, was not the only royalist leader.

The progress of the war in the Rhine region was also successful. In September, the French army, commanded by the combined forces of the French and the allies, made every possible effort to break the French from the strong lines of Weisbaden, on the river Lauter. On the 13th of October, the Austrian general Wurmsel made a grand attack upon these lines. The French say that their generals betrayed them, and suffered the lines to be taken almost without resistance. The general of the allies confessed that the lines might have held out for several days. The French retreated to Hagenau, from which they were driven on the 18th; and suffered two other defeats on the 25th and 27th. Some of the principal citizens of Strasbourg now sent a private deputation to General Wurmsel, offering to surrender the town, to be preserved as a depôt to be restored to Louis

rannical than this was never made by an eastern despot; and when it was first published, foreigners were at a loss whether to regard it as a sublime effort of a powerful government, or as a wild project which could produce nothing but confusion. The effects of it, however, have been truly terrible. We have already mentioned some of them in the bloody contest which occurred upon the Rhine, and Europe was soon destined to bear witness to still more extraordinary events.

**178** **ocial** **ulture** **tract and** **ext. uted**

**179** **Mir** **of the queen**

In the end of July, General Custine was brought to trial, and executed, in consequence of a series of accusations of infidelity to his trust and of his conduct in the convention. The queen was next brought before the revolutionary tribunal, on the 16th of October. The charges against her were very various, but the chief tendency of them was to prove that she had always been hostile to the revolution, and that she had all the efforts that had been made by the convention to bear witness to still more extraordinary events.

**180** **Execution** **of the head** **of the Girondin** **party**

On the 16th of October, this beautiful woman, whom fortune once placed so high, ended her days on a scaffold, after a mock trial, in which no regard was paid either to justice or decency. She behaved with much dignity and composure, and appeared deeply impressed with a sense of religion. The members of the convention who had been at the head of the Girondin party, and had either been detained in prison since the 31st of May, or seized in the departments to which they had retired, were afterwards brought to trial. On the 30th of October, 21 of them were executed, viz. Bissot, Vergniaud, Gensonné, Dupart, Lehardi, Ducos, Fontrede, Boileau, Gardien, Duchatel, Sillery, Lauchet, Dufliche, Dupeiret, La Source, Carra, Beauvais, Mauville, Antiboul, Vigée, and Lacaze. Seventy one were still detained in confinement. The duke of Orleans was afterwards condemned, on a charge of having aspired to the sovereignty from the beginning of the revolution. His execution gave satisfaction to all parties. His vote for the punishment of death upon the trial of the late king had done him little honour even in the opinion of the Mountain, and had rendered him odious to all the rest of mankind.

**182** **Executions** **become** **prodigious** **common**

The executions of persons of all ranks, particularly of priests and nobles, became now so common, that it would be in vain to attempt to give any detail of them. Every person brought before the revolutionary tribunal was condemned as a matter of course. The Jacobins seemed insatiable in their thirst after blood, and the people at large appeared to regard their conduct with unaccountable indifference.

**183** **At** **weights** **and mea-** **sur estab-** **lished**

When the human mind is once roused, its activity extends to every object. At this time a new table of weights and measures was established by the convention, in which the decimal arithmetic alone is employed. The court of Spain had the liberality, notwithstanding the war, to suffer M. Mechain to proceed in his operations for measuring a degree of the meridian in that country. He carried on his series of triangles from Barcelona to Perpignan; and from this place the mensuration was continued to Paris. M. de Lambre, and his pupil M. le François, also measured a degree of latitude in the vicinity of the metropolis. In all, 12 degrees of the meridian were measured; of which the mean is 57027 toises, and by this the universal standard of measure is calculated. M. M. de Borde and Cassini determined the length of a pendulum that swings se-

conds, *in vacuo* and in a mean temperature at Paris, to be 3 feet and 8,06 line. M. M. Lavoisier and Haüy found that a cubic foot of distilled water at the freezing point weighs *in vacuo* 70 pounds and 60 gros French weight. We shall insert a table of the measures and weights now established.

## Long Measure.

Metres.	French Toises.
10,000,000 = a quadrant of the meridian which is the principle on which the new measure is founded	5132430
100,000 = a hundredth part of a quadrant, or decimal degree of the meridian	51324
1000 = a milliare, or mile	513
100 = a stadium	513243
10 = a perch	513243
	Feet. Inch. Lines.
1 = a metre, or reed-lineal	3 0 11.44
10 = a decimetre, or palm	0 8 8.344
100 = a centimetre, or finger	0 0 4.434
1000 = a millimetre	0 0 0.443

## Superficial Measure.

Sq. Metres.	Sq. Toises.
10,000 = an are, or superficial unit, being a square the side of which is 100 metres in length	94781
1000 = a deciare, or tenth of an are, a superficial hundred metres long, and ten broad	94781
100 = a centiare	94781

## Manufacture of Capacity.

Cub. decimetres.	Paris Pints.	Paris Measures.
1000 = the cubic metre, or cubic toise	1000	1000
100 = the cubic decimetre, or cubic toise	100	100
10 = the cubic centimetre, or cubic toise	10	10
1 = the cubic millimetre, or cubic toise	1	1
		French Pounds.
1000 = the weight of a cubic decimetre of water, or	2044.4	
100 = the weight of a cubic centimetre of water, or	204.44	
10 = the weight of a cubic millimetre of water, or	20.444	
	lb. on gros. grains.	
1 = the weight of a cubic decimetre of water, or pound	2 8 5 49	
.1 = 1/10 of a grave, or decigrave, or ounce	0 3 2 12.1	
.01 = 1/100 of a grave, or centigrave, or dram	0 0 2 44.41	
.001 = the weight of a cubic centimetre of water, is named a grave, or maille	0 0 0 18841	
.0001 = decigravet, or grain	0 0 0 18841	
.00001 = centigravet	0 0 0 18841	

**French  
Revolution  
1793.**

A piece of silver coin weighing a *centigrave*, and a *franc* of silver, according to the former standard, will be worth 40 sols 10½ deniers. The *milliare*, or thousand *metres*, is substituted for the mile; and the *are*, for the arpent in land-measure. The latter two are to each other as 49 to 25. The astronomical circles with which M. M. de Borda and Cassini made the observations, are divided according to this plan. The quadrant contains 100 degrees, and each degree 100 minutes. Hence the minute of a great circle on our globe is equal to a *milliare*, or new French mile. If, for the reduction of this measure, we estimate the Paris toise, according to the comparison made with the standard kept in the Royal Society of London, at 6.392½ English feet, the *milliare* or minute will be equal to 109.3633 yards, and the *metre* 3.28099 feet.

184  
A new ka-  
lender  
formed.

At the same period a new calendar was formed. By it the year is made to begin with the autumnal equinox, and is divided into 12 months. These are called Vendemaire, Brumaire, Fumaire, Nivose, Ventose, Pluviose, Germinal, Floreal, Prairial, Messidor, Fervidor, and Fructidor. The months consist of 30 days each, and are divided into three decades. The days of each decade are known by the names of Primiti, Duo, Tri, Tetra, &c. to Decadi; and the day of rest is appointed for every tenth day, instead of the seventh. The day (which begins at midnight) is distributed into ten parts, and these are decimally divided and subdivided. Five superfluous days are added every year after the 30th of Fructidor. To these is given the absurd appellation of *Jour D'indulgence*; a word borrowed from a term of reproach (*jaun yellow*), which had of late been bestowed on the republican party from the pallidness of their robes and countenances, which that party have interpreted as either honourable and popular, or as a childish folly; this innovation has struck the nation with surprise, as it can serve no good purpose whatever. It is a singular instance of the waywardness of the human mind, which can occupy itself with trifles, and neglect the most important, and the most useful duties of existence. As the principal division of time

**Decay of religion.**

The members of France had been generally under its influence; and on the part of themselves, the bishop of Paris, along with a great number of his suffragans, came into the hall of assembly, and solemnly renounced their religious and political ties with the Christian religion. All the clergymen, however, who were Catholic, that were members of the assembly, followed this example, excepting only the bishop of Amiens, formerly mentioned as having been one of the first priests that joined the *Tiers Etat* after the meeting of the states-general. He had the courage to profess himself a Christian, although he said that the emolument of his bishopric were at the service of the republic. With the acclamations of the convention, it was decreed that the only French deities hereafter should be Liberty, Equality, Reason, &c. and they would seem to have consecrated these as a kind of new objects of worship.—What political purpose the leaders in the convention intended to serve by this proceeding does not clearly appear; unless, perhaps, their object was to render the French manners and modes of thinking so completely new, that it should never be in their power to return to the state from which they had just emerged, or to unite

in intercourse with the other nations of Europe. The populace, however, could not at once relinquish entirely the religion of their fathers. The Commune of Paris ordered the churches to be shut up, but the Convention found it necessary to annul this order; and Robespierre gained no small degree of popularity by supporting the liberty of religious worship on this occasion. Hebert and Fabre d'Eglantine, who led the opposite party, hastened their own fall by this ill-judged contempt of popular opinion.

Here, now, then, the republic saw itself successful in all quarters, when the mountain party and the Jacobins had no rival at home, and accounted themselves in no immediate danger from abroad, they began to split into factions, and the fiercest jealousies arose. The Jacobin club was the usual place in which their contests were carried on; and at this time Robespierre acted the part of a mediator between all parties. He attempted with good art to turn their attention from private animosities to public affairs. He spread a report that an invasion of Great Britain was speedily to take place. He therefore proposed that the Jacobin club should set themselves to work to discover the vulnerable parts of the British constitution and government. They did so: They made speeches, and wrote essays without number. And in this way was the most fierce and turbulent band of men that ever perhaps existed in any country occupied and amused for a very considerable time. What is no less singular, a great number of British subjects favoured the plans of these reforming Atheists, and, under the specious appellation of the *Friends of the People*, acted in concert with the French Jacobins.

The winter passed away in tolerable quietness, and no military enterprise was undertaken either by the allies or by the French. On the 11th of February, Barrere asserted in the convention that the confederate powers were willing *provisionally* to acknowledge the French republic, to consent to a cessation of hostilities for two years, at the end of which a lasting peace should be ratified by the French people. But this proposal the convention declared itself determined to reject, as affording to the other nations of Europe the means of undermining their new government. In the mean time, the revolutionary government was gradually becoming more vigorous. Thirty committees of the Convention managed the whole business of the state, without sharing much of the direct executive government, which rested in the committee of public safety. These different committees were engaged in the utmost variety of objects. The ruling party had no competitors for power. Without confusion or opposition, therefore, the most extensive plans were rapidly carried into effect. The convention was little more than a court in which every project was solemnly registered. In the same session 30 decrees would sometimes be passed upon objects the most widely different. The finances were under one committee, at the head of which was Cambon.— This committee found resources for the most lavish expenditure. The assignats were received as money throughout the state; and thus a paper mill was said to have become more valuable than a mine of gold. Their credit was supported by an arbitrary law regulating the maximum or highest price of all provisions, and by the immense mass of wealth which had come into the hands of the convention by seizing the church lands, and by confiscating the property of royalists, emigrants, and

persons condemned by the revolutionary tribunal. So unequally had property been divided under the ancient government, that by means of these confiscations about seven-tenths of the national territory was supposed to be in the hands of the public. To this was added the plunder of the churches, consisting of gold and silver saints, and utensils employed in divine worship, along with other articles of less value; among which may be mentioned the innumerable church bells, which were regarded as sufficient for the manufacture of 15,000 pieces of cannon. These resources formed a mass of property such as never was possessed by any government.

Other committees were engaged in very different objects. Highways were constructed, and canals planned and cut throughout the country. Immense manufactories of arms were everywhere established. At Paris alone 1100 muskets were daily fabricated, and 100 pieces of cannon cast every month. Public schools were assiduously instituted, and the French language taught in its purity from the Pyrenees to the Rhine. The French convention possessed immense resources, and they did not hesitate to lavish them upon their schemes. Every science and every art was called upon for aid, and the most accomplished men in every profession were employed in giving splendour to their country. The chemists, in particular, gave essential aid by the facility with which they supplied materials for the manufacture of gunpowder; and in return for their services, Lavoisier, the greatest of them, suffered death by a most iniquitous sentence. Not fewer than 200 new dramatic performances were produced in less than two years; the object of which was to attach the people to the present order of things. The vigour with which the committees of subsistence exerted themselves is particularly to be remarked. As all Europe was at war with France, and as England, Holland, and Spain, the three maritime powers, were engaged in the contest, it had been thought not impossible to reduce France to great distress by famine, especially as it was imagined that the country had not resources to supply its immense population. But the present leaders of that country acted with the policy of a besieged garrison. They seized upon the whole provisions in the country, and carried them to public granaries. They registered the cattle, and made their owners responsible for them. They provided the armies abundantly, and, as the people were accurately numbered, they dealt out in every district, on stated occasions, what was absolutely necessary for subsistence, and no more. To all this the people submitted; and indeed, throughout the whole of the mixed scenes of this revolution, the calm judgment of the historian is not a little perplexed. We cannot avoid admiring the patience with which the people at large endured every hardship that was represented as necessary to the common cause, and the enthusiastic energy with which they lavished their blood in defence of the independence of their country. At the same time, we must regard with indignation and disgust the worthless intrigues by means of which the sanguinary factions in the convention and the capital alternately massacred each other.

During the winter the dissensions of the Jacobins still increased. They were divided into two clubs, of which the new one assembled at a hall which once belonged to the Cordeliers. The leaders of it were He-

bert, Ronsin, Vincent, and others; but the old society retained its ascendancy, and Robespierre was now decidedly its leader. This extraordinary man had gradually accumulated in his own person the confidence of the people and the direction of the government. As the committees were above the convention, which was become little more than a silent court of record, so the committee of public safety was above the other committees. Robespierre was the leader of this ruling committee. Barrere, St Just, Couthon, and others of its members, only acted a secondary part. They laboured in the business of the state, but the radical power was with Robespierre. He surrounded the members of the convention with spies. He was jealous and implacable, and set no bounds to the shedding of blood. On the 21st of March he brought to trial the following active Jacobins, who were condemned and executed on the following day: Hebert, Ronsin, Momoro, Vincent, Du Croquet, Kœq, Col. Laumur, M. M. Bourgeois, Marnel, La Bourreau, Ancard, Le Clerc, Proly, Desbœux, Anacharsis Cloots, Percire, Florent Armand, Descombes, and Debailon. Not satisfied with this, on the 2d of April he brought to trial nine of those who had once been his most vigorous associates, Danton, Fabre d'Eglantine, Bazire, Chabot, Philippeaux, Camille Desmoulins, Lacroix, Delaunay d'Angers, Heault de Sechelles, who, along with Weissman, were executed on the evening of the 5th.

Still, however, the preparations for the ensuing campaign were proceeding with unabated vigour. The committee for military affairs, at the head of which were Carnot, La Fayette, d'Anjou, and others, was busy in arranging along the frontiers the immense force which the requisition had called forth. Plans of attack and defence were made out by this committee, and approved by the committee of public safety; they were then to the generals to be executed. On the other side, the allies were making powerful preparations for another attempt to subvert France. The emperor, who took the field at the head of the armies in the Netherlands. The plan of the campaign is said to have been formed by the Austrian general Mack. Well planned as it was to be, it was not to be successful. The main army was to penetrate to Amsterdam, and getting within the reach of French frontier towns, it was to cut them off from the interior by covering the country from the North Sea to the Rhine. The plan was bold. It belongs to the history of the revolution that this was not its only aim. It was intended to put it in execution, the army was to be informed of the immense force which the French were collecting against them. Even the city of Antwerp, which is capable of containing a large army within its walls, and which was to be left in their power, should have seemed an insurmountable objection to the plan.

On the 16th of April the Austrian, British, and Dutch armies assembled on the heights above Cateau, and were reviewed by the emperor. On the following day they advanced in eight columns against the French, drove in their whole posts, and penetrated beyond Landreies; which place the French attempted to relieve, but without success. The allied army now amounted to 187,000 men, who were disposed in the following manner; 15,000 Dutch and 15,000 Austrians, under the prince of Orange and General Latour, formed the siege

siege of Landrecies; 15,000 British and 15,000 Austrians, commanded by the duke of York and General Otto, encamped towards Cambray. The emperor and the prince of Saxe-Cobourg, at the head of 60,000 Austrians, were advanced as far as Guise; 12,000 Hessians and Austrians under General Worms were stationed near Douay and Bouchain; Count Kaunitz with 15,000 Austrians defended the Sambre and the quarter near Maubeuge; and, lastly, General Clairfait, with 40,000 Austrians and Hanoverians, protected Flanders from Tournay to the sea: 60,000 Prussians, for whom a subsidy had been paid by Great Britain, were expected in addition to these, but they never arrived.

The French now commenced their active operations. On the morning of the 26th of April they attacked the duke of York near Cateau in great force. After a severe conflict they were repulsed, and their general Chapuy was taken prisoner. At the same time they attacked the troops under his imperial majesty, but were there also repulsed in a similar manner; losing in all 57 pieces of cannon. On the same day, however, General Pichegru advanced from Lille, attacked and defeated General Clairfait, took 32 pieces of cannon; and, in the course of a few days, made himself master of Warwick, Menin, and Courtray. On the 30th of April, the garrison of Landrecies surrendered to the allies. When this event was known in the convention, it excited a considerable degree of alarm. It was, however, the last effectual piece of success enjoyed by the allies during this disastrous campaign. General Clairfait was again completely defeated by Pichegru in a general engagement; and it was found necessary to send the duke of York to his assistance. This movement was no doubt unavoidable; but the effect of it was, that it split down the allied army into a variety of portions capable of carrying on a desultory warfare, but not for the vigorous objects of conquest. On the 1st of May the duke of York was attacked near Tournay by a body of the enemy, whom he repulsed; but he was afterwards joined by Clairfait, upon whose destruction the French were chiefly bent; for at the same time that the duke of York was engaged by the attack upon himself, Pichegru fell upon Clairfait with such irresistible impetuosity, that he was compelled to retreat in confusion, and a part of his army was obliged to have fled to the neighbourhood of Bruges. When Pichegru was thus advancing successfully in West Flanders, General Jourdan advanced in East Flanders from Maubeuge, crossed the Sambre, and forced General Kaunitz to retreat. On the 18th, however, General Kaunitz succeeded in repulsing the enemy in battle, and they re-crossed the Sambre with confidence.

The allies now found that no progress could be made in France while General Pichegru was advancing successfully and occupying West Flanders in their rear. The emperor, therefore, withdrew the greater part of his army to the neighbourhood of Tournay, and resolved to make a grand effort to cut off the communication between Courtray and Lille, thus to prevent completely the retreat of Pichegru. On the night of the 16th, the army moved forwards in five columns for this purpose. Clairfait was at the same time directed to cross the Lys, to effect a general junction, if possible, and complete the plan. The attempt during that evening seemed to promise success; but, in the course of next

day, the division under the duke of York was overpowered by numbers and defeated. The progress of the rest of the columns was stopped, and Clairfait completely defeated. In the confusion of the day, when attempting to rally the different parts of the division which he commanded, the duke of York was separated from his own troops by a party of the enemy's cavalry, and only escaped being made prisoner by the swiftness of his horse. The plan of the allies being thus frustrated, their army withdrew to the neighbourhood of Tournay.

Pichegru speedily attempted to retaliate against the allies. On the 22d of May he brought down at day-break his whole force against them. The attack was commenced by a heavy fire of artillery, and all the advanced posts were forced. The engagement soon became general; the attacks were repeatedly renewed on both sides; the whole day was spent in a succession of obstinate battles. All that military skill could do was performed on both sides. The French and the allied soldiers fought with equal courage and equal discipline. At nine o'clock in the evening the French at last reluctantly withdrew from the attack. The day on which a vanquished enemy flies from the field is not always that on which the victory is won. In this engagement the French were unsuccessful in their immediate object; but the weight of their fire, their steady discipline, and their violent obstinacy of attack, raised their military character high in the estimation of the officers and soldiers of the allied army. It was soon perceived, that in addition to these they possessed other advantages. Their numbers were immense; they implicitly obeyed their generals; who, being men newly raised from the rank of subalterns, as implicitly submitted to the directions of the committee of public safety. A combination of efforts was thus produced whose operation was not retarded by divided counsels. On the other side, the numbers of the allies were daily declining; their leaders were independent princes or powerful men, whose sentiments and interests were often very hostile to each other, and their exertions were consequently disunited.

On the 24th the French again crossed the Sambre, but were driven back with much loss. On the 27th an attempt was made to besiege Charleroi, but the prince of Orange on the 3d of June compelled them to raise the siege. On the 12th a similar attempt was made, and they were again repulsed. In West Flanders, however, Pichegru was sufficiently strong to commence the siege of Ypres. He was soon attacked by General Clairfait for the purpose of relieving it, but without success.—Ypres was garrisoned by 7000 men; reinforcements were therefore daily sent from the grand army to Clairfait for the purpose of relieving it. It is unnecessary to mention the bloody contests in which that unfortunate general was daily engaged with the French; it is sufficient to say, that they were uniformly unsuccessful, and were the means of wasting, in a great degree, the armies of the allies. Ypres held out till the 17th of June, when it capitulated: and such was the discipline of the French army at this time, that no notice could be obtained, for several days, of that event. In consequence of it and of other events, the duke of York found it necessary to retreat to Oudenarde; for Jourdan, after storming the Austrian camp

of Betignies, now advanced with such strength upon Charleroi in the east that its immediate fall was feared. As this would have enabled the two French armies to encircle the whole of Flanders, the prince of Cobourg advanced to its relief. Charleroi surrendered at discretion on the 25th. This circumstance was not known by the prince of Cobourg when he advanced on the 26th to attack in their intrenchments the army that covered the siege near Fleurus: but the covering army being by this time reinforced by the accession of the besieging army, the allies were repulsed. The allies then drew his men out of their intrenchments, and in his turn, attacked the Austrians. He was then repulsed, but was at last successful: the loss of the repulsed army is said to have been prodigious; but no regular accounts of it have been published. The French unquestionably exaggerated their own losses, which they said that it amounted to 15,000 men.

The allies now retreated in all quarters. Maastricht, Ostend, and Bruges, were taken; and Tournay, Mons, Oudenarde, and Brussels, opened their gates. At the last place the French armies of East and West Flanders united. Landrecies, Valenciennes, Condé, and Quesnoy, were fruitlessly left with garrisons in them. The allied troops, evacuating Namur, formed a line from Antwerp to Liege to protect the country behind. The French advanced in full force, and attacked General Clairfait, cut to pieces half the troops that now remained under him, and broke the line. The allies retreated before them. The duke of York was joined by some troops under the earl of Moira that with much difficulty had made their way to him from Ostend; and with these and the Dutch troops he retired to the neighbourhood of Bergen-op-zoom and Breda for the protection of Holland. The prince of Cobourg evacuated Liege, crossed the Meuse, and placed a garrison in Maesricht. He soon, however, lent back a part of his troops to the neighbourhood of Tongres; for here, to the astonishment of all Europe, the French armies made a voluntary pause in their career of victory, and ceased to pursue their retiring foes. Sluys in Dutch Flanders was the only foreign post that they continued to attack, and it surrendered after a siege of 21 days.

On the Rhine the war was equally successful on the part of the French. On the 12th, 13th, and 14th of July, repeated engagements were fought; in which the French enjoyed their usual success. They had numerous armies in every quarter. Their mode of fighting was, to make full preparation for accomplishing their object, and to fight in great bodies day after day till it was obtained. The palatinate was thus overrun, and Treves taken, by General Michaud. Flanders and the palatinate have always been accounted the granaries of Germany; and both of them, at the commencement of the harvest, now fell into the hands of the French.

During the course of this summer Corsica was subdued by Great Britain; and the whole of the French West India islands, excepting a part of Guadaloupe, yielded to the British troops under the command of Sir Charles Grey and Sir John Jarvis. On the first of June the British fleet, under the command of Earl Howe, gained a most splendid victory over the French fleet to the westward of Ushant. The French committee of safety were known to have purchased in America im-

mense quantities of grain and other stores. These were embarked on board 160 sail of merchantmen, conveyed by six sail of the line. Lord Howe failed to intercept this valuable convoy. The French fleet sailed at the same time to protect it. On the morning of the 28th of May the fleets came in sight of each other. The British admiral had previously despatched six ships of the line under Admiral Montague to intercept the French convoy, while he should engage and detain the grand fleet. The French despatched eight sail to defeat this attempt. In the course of the 29th Lord Howe got to windward of the French fleet. His force was 25; and theirs was 26, sail of the line. The following day he bore down upon them, and broke their line. The engagement was one of the severest ever fought. The French admiral, in less than an hour after the close action commenced in the centre, crowded off with 12 of his ships. The British fleet was so much disabled, or separated, that several of the French dismantled ships got away under sails raised on the stump of their fore masts. Seven sail of the line, however, remained in possession of the British, and two were unquestionably sunk. In the mean time, Admiral Montague fell in with the French convoy, but it was now guarded by 14 sail of the line. As he could not encounter such a force, he returned home, and it was safely conveyed into port. Thus, by one of those contradictions which so often occur in human affairs, the British fleet was victorious, and the French were left in some measure masters of the sea. As this engagement however testified that the British sea-men had not lost their ancient superiority of their armament, the nation regarded the present victory as a pledge of its independence, and very general rejoicings took place in consequence of it.

In the mean time, the revolutionary system of government in the hands of committees of the convention at Paris, and of committees of the popular societies throughout the country, was arrived at its highest pitch of faction, and continued without opposition to increase and strengthen.

On the 10th of July, the Convention, after a long and violent debate, decreed that the names of every man, woman, and child, who had been a member of the revolutionary committee, should be published in a similar manner, and that the names of the great objects of their hatred should be published in a similar manner. The names of the great objects of their hatred were the names of the ruling powers. By the different names of the ruling powers, and contrived to destroy every authority, the constituted authorities consisted of a part of the Convention, and the ruling powers, and the committees which conducted the business of the Convention, his will was irresistible throughout the republic. He met with no opposition in the convention; for that body was no longer the turbulent popular assembly which it had once appeared; it was little more than a name employed to give some sort of respectability to such schemes as were proposed to it.

Amidst this accumulation, however, of seemingly irresistible authority, Robespierre was at the brink of ruin. The whole of the old Girondist party was indeed subdued and silent; but many members of the convention still remained attached to it. The party of the Mountain,

Mountain, by means of whom Robespierre had risen to power, with little satisfaction now found themselves not only disregarded, but ready at every instant to fall a sacrifice to that system of terror which they had contributed to erect. Even the Jacobins themselves, though neither timid nor cautious in the shedding of blood, began to murmur when they saw that awful privilege confined exclusively within a few hands, or rather monopolized by an individual. In this state things remained for some time; and it appeared how possible it is for an individual to govern a great nation even while the whole of that nation is hostile to his power. The banishment or imprisonment of all foreigners, which had long been rigorously practised, prevents us from possessing much accurate information concerning the internal state of France at this period; but it is certain, that one circumstance in particular tended much to accelerate the fall of Robespierre. He had procured a decree to be passed, authorizing the committee of public safety to imprison at its pleasure, and bring to trial, any member of the convention. All the individuals of that body found themselves placed by this decree in the hands of a man whose severe and suspicious temper, they well knew. Still, however, they were so much surrounded by spies, that it was difficult to form a party or plan of operation; even the majority of the committee of public safety were among the number of the disaffected, but they dared not to withstand their chief. At last, on the 25th of July, the convention began to exhibit signs of agitation. It was understood, that in the course of a few days Robespierre would sacrifice a number of the members to his suspicions. On the following day the sitting of the convention was still more tempestuous. In a long speech Robespierre defended his own conduct against those who had reproached him with aspiring to the dictatorship of France. He attacked the party whom he styled *moderates*, as wishing to overturn the revolutionary government, and to restore the feeble system of the Girondists. The result of a long debate was, that Robespierre was apparently victorious, and his speech was ordered to be printed. On the 26th the convention appeared to be in a calmer state. A member of the committee of public safety, in attempting to defend Robespierre, was interrupted; and Billaut of Valenciennes stood forward and enumerated the crimes, and proclaimed the tyranny of Robespierre. The speech was received with bursts of applause. Robespierre in vain attempted to defend himself; he was silenced by shouts of execration from every part of the hall. Tallien seconded the former speaker in his accusation. The sitting was declared permanent, and a decree of arrest was passed against Robespierre and a younger brother of his, along with St. Just, Couthon, and Lebas. These men left the convention, and found security in the hall of the commune of Paris; where the municipal officers agreed to protect and stand by them. The tocsin was sounded; the armed force was under their command; an insurrection was therefore attempted against the convention: but the sections of Paris refused their support. Very few of the troops could be collected, and these were not firm; the late tyranny had become odious. The hall of the commune was therefore speedily surrounded; and about three o'clock in the morning of the 28th Robespierre and his associates were made prisoners. They had been outlawed

by the convention on account of their resistance. They were not therefore tried, unless for the purpose of identifying their persons; and, in the course of that day, they were executed: 60 of the municipal officers were also executed for joining in their rebellion; and in this way a storm passed over, which at one time threatened to involve the French capital in ruin, and filled all Europe with astonishment. Thus also terminated the career of the most extraordinary man that the French revolution had brought forward. His talents were undoubtedly considerable, and his ambition knew no bounds, bidding defiance to the ordinary feelings of humanity. Had Dumourier possessed his coolness and caution, or had he possessed the military talents of Dumourier, the convention would certainly have been overturned, and we should have seen a second Cromwell on the throne of his murdered sovereign.

After the fall of Robespierre, the convention exhibited no small change of appearance. Instead of that silence which formerly prevailed, all was bustle and noise; all accused each other. There was no longer any leader, and there was no formed party. The former system of terror was declared to be at an end, and a new system of *moderation* succeeded. This was carried to as great a height as the system of terror had formerly been; and all means were taken to render popular the fall of their late tyrant. The committees were organized anew, and their members ordered to be frequently changed. The correspondence between the affiliated Jacobin clubs was prohibited, and at last the Jacobin club itself was abolished. This last event was accomplished with ease; and that society which had been the great engine of the revolution, was itself without resistance overturned. Seventy-one deputies of the Girondist party, who had been imprisoned since the 31st of May 1793, were set at liberty. The name of Lyons was restored to it. Some of the agents of Robespierre were punished, particularly the infamous Carrier, whose cruelties in La Vendée we formerly mentioned. Still, however, the convention appeared so little united and so little decided with regard to objects of the first importance, that in all probability they would not have conducted the important struggle against the nations of Europe with more success than the Girondist party had formerly done, if the revolutionary government and the late system of terror had not already accumulated in their hands such vast resources, and traced out such a plan of procedure, as rendered it an easy matter to preserve their numerous armies in the train of success to which they were now habituated.

The allies in their retreat had left strong garrisons in the French towns which had surrendered to them. These were Condé, Valenciennes, Quesnoy, and Landrecies. They now surrendered to the republican armies with so little resistance, that the conduct of the emperor began to be considered as ambiguous, and he was suspected of having entered into some kind of compromise with the French. This idea proved erroneous; and as soon as the army which had besieged these towns was able to join the grand army under Pichegru and Jourdan, the operations of the campaign were resumed after a suspension of almost two months. The French army divided itself into two bodies. One of these under Jourdan advanced against General Clairfait, who had succeeded the prince of Cobourg in the command

Further  
successes of  
the French,

in the neighbourhood of Maastricht. On the 15th of September the French attacked the whole Austrian posts in an extent of five leagues from Liege to Maastricht. On that and the following day the losses were nearly equal. On the 17th the French with 50 pieces of cannon attacked General Kray in his intrenched camp before Maastricht. M. de Kray was already retiring when General Clairfait arrived with a strong reinforcement, and after a severe combat the French were once more compelled to retire. On the 18th the French renewed the attack with tenfold fury upon every part of the Austrian line, and the whole was compelled to fly to the neighbourhood of Aix-la-Chapelle. General Clairfait now chose a strong position on the banks of the Roer, where he even declared it to be his wish that he might be attacked. But by this time the spirit of his army was humbled, deservous became numerous, and the want of discipline was extreme. On the 1st of October the French crossed the Maese and the Roer, and attacked the whole Austrian posts from Ruremond down to Juliers. After a bloody engagement, the brave and active, though unfortunate, General Clairfait was compelled hastily to cross the Rhine, with the loss of 10 or 12,000 men. The French general did not attempt to cross that river, but one detachment of his army took possession of Coblenz, while others laid close siege to Venlo and Maastricht, which soon surrendered.

209  
and their  
progress in  
the con-  
quest of  
Holland;

The division of the French army, in the mean time, under General Pichegru came down upon Holland, and attacked the allied army under the duke of York between Bois-le-duc and Grave. They forced the advanced post of Bostel. Lieutenant general Abercromby was sent to attempt to recover this post on the 15th of September, but he found the French in such force that he was obliged to retreat. Indeed the French were discovered to be no less than 80,000 strong in that neighbourhood. The duke of York was unable to contend against a force so superior, and retired across the Maese with the loss of somewhat less than 1500 men. Pichegru immediately laid siege to Bois-le-duc. On the 30th of September, Crevecoeur was taken, and Bois-le-duc surrendered in 10 days thereafter. In it 408 French emigrants were taken prisoners; and these, as well as 700 that had been taken at Nieupoort, 500 at Sluys, and 1100 at Valenciennes, were all put to death, agreeably to the rigorous law formerly made by the convention. The French now followed the duke of York across the Maese. Upon this the greater part of the allied army under his royal highness crossed the Rhine and took post at Arnheim. The remaining part of the army followed soon after, and Nimeguen was occupied by the French on the 7th of November. The duke of Brunswick was at this time requested to take the command of the allied army, to protect Holland, if possible. He came to Arnheim for that purpose; but after examining the state of things there, he declined the undertaking. The allied troops had now so often fled before their victorious and almost innumerable enemies, they had so often been in want of every necessary, and had been received so ill by the inhabitants of the countries through which they passed, among whom the French cause was extremely popular, that they had lost that regularity of conduct and discipline which alone can afford a secure prospect of success in military affairs.

French

210  
Conduct,  
discipline,  
of the  
French ar-  
mies.

The French, on the contrary, well received, abounding in every thing, and proud of fighting in a popular cause, now acted with much order, and submitted to the strictest discipline. In addition to all these advantages, the French leaders had the dexterity to persuade the world that, new and unknown arts were employed to give aid to their cause. At this period the *telegraphe* was first used for conveying intelligence from the frontiers to the capital, and from the capital to the frontiers. (See TELEGRAPHE). Balloons were also used by the French during this campaign to procure knowledge of the position of the enemy. An engineer ascended with the balloons, which was suffered to rise to a great height, but prevented from flying away by a long cord. He made plans of the enemy's encampment; and during an attack he sent down notice of every hostile movement. In the affairs of men, and more especially in military transactions, opinion is of more importance than reality. The French soldiers confided in their own officers as men possessed of a kind of omniscience, while the allied troops, no doubt, beheld with anxiety a new contrivance employed against them, whose importance would be readily magnified by credulity and ignorance. With all these advantages, however, after the capture of Nimeguen, they once more made a halt in their career, and abstained from the attack of Holland, which now seemed almost prostrate before them.

211

While these events occurred in the north, the French Their suc-  
arms were scarcely less successful on the side of Spain, cesses in  
Bellegarde was taken; in the Western Pyrenees, Font-  
arabia, surrendered, and also St Sebastian; the whole Spain  
kingdom of Spain seemed panic struck. That feeble government, with an almost impregnable frontier, and the most powerful fortresses, could make little resistance, and the difficult nature of their country was their only protection. The history of this war is only a history of victories on the part of the French. In the Eastern Pyrenees, on the 17th of November, the French general Dugommier was killed in an engagement, in which his army was successful. On the 20th of that month the French again attacked the Spaniards, and routed them by means of the bayonet, without firing a single musket shot. Ten thousand men, and cannon, for an army of 50,000 men, fell into the hands of the conquerors, along with a great part of the province of Navarre. Towards the end of the year, an army of 40,000 Spaniards, entrenched behind fortifications, the labour of six months, suffered themselves to be completely routed; their general, General de la Union was found dead on the field of battle, and the whole Spanish artillery was taken. In three days thereafter, the fort Fernando de Figueras, containing a garrison of 9107 men, surrendered, although it mounted 171 pieces of cannon, and possessed abundance of provisions. The French continued their conquests; Rosas was taken, and the whole province of Catalonia was left at the mercy of the invaders.

212

The successes of this wonderful campaign were not yet terminated; and the last part of them is perhaps the most important, although no great effort was necessary to its execution. The winter now set in with uncommon severity. For some years past the seasons of Europe had been uncommonly mild; there had been little frost in winter, and no intense heat in summer. But during the late season the weather had long been

The con-  
quest of  
Holland  
completed.

French Revolution, 1795. markedly dry till the latter part of harvest, when there fell a considerable, though by no means unusual, quantity of rain. Towards the end of December a severe frost bound up the whole of the rivers and lakes of Holland. The Waal was frozen over in the beginning of January; a circumstance which had not occurred for 14 years past. Taking advantage of this, the French crossed that river, and with little opposition seized the important pass of Bommell, which at other seasons is so strong by its inundations. The allied army had been joined by 17,000 Austrians, and had received orders to defend Holland to the last. They did so, and were successful in repulsing the French for some days between the Waal and the Leck; but the republican army, amounting to 70,000 men, having at last advanced in full force, the allied troops were compelled to retire across the Yssel into Westphalia. In the course of their march through this desert country, in the midst of severe frost and a deep snow, they are said to have suffered incredible hardships, and to have lost a very great number of men. The French, in the mean time, advanced rapidly across the country to the Zuyder Zee, to prevent the inhabitants from flying, and carrying off their property. On the 16th of January 1795, a party of horse, without resistance, took possession of Amsterdam. The other towns surrendered at discretion. In consequence of an order from the states-general, the strong fortresses of Bergen-op-zoom, Williamstadt, Breda, &c. opened their gates to the French. The fleet and the shipping were seized by the intense frost in their stations, and fell a prey to the enemy; who thus, with little effort, made a complete conquest of this populous and once powerful country. The French were well received by the people at large. The power of the stadtholder had been supported among them merely by the influence of Prussia and England. Through hatred to this office, which had now become odious chiefly to the mercantile aristocracy of Holland, they were little attached to their allies, and gave them, during the present war, as little support as possible. The stadtholder and his family now fled to England. The French declared, that they did not mean to make subjects but allies of the Dutch, and invited them to call together popular assemblies for settling their own government, under the protection of the French republic.

Thus terminated a campaign, the most astonishing, perhaps, that has been known in the history of mankind. In the course of it, even before the conquest of Holland, the French had taken 2000 pieces of cannon and 60,000 prisoners. After that event, the conquered territories added to them a population of nearly 14 millions of people. Luxembourg and Mentz were the only places on this side of the Rhine that resisted them. The former was closely blockaded, for the purpose of compelling it to surrender; the latter was several times assaulted, but successfully held out.

Europe was now weary of this bloody strife. The German diet of Ratisbon declared its resolution to take measures for procuring peace. The grand duke of Tuscany concluded a treaty with the French republic. France itself, exhausted by massacres, emigrations, and the terrible efforts which it had made, wished for tranquillity; and the convention found it necessary to declare that they were willing to treat for peace with any of the powers of Europe, upon honourable terms.

The frequent changes, however, which have with astonishing rapidity taken place in the mode of conducting French affairs, and the different principles displayed by the different factions, as they successively got into power, have produced in Great Britain and Austria a very general persuasion that no peace concluded with the present convention could either be honourable or permanent; and therefore these two mighty nations have resolved to continue the war with redoubled vigour. In support of the wisdom of this resolution, it has been observed, that the hatred of the Mountain to the Girondists was such, that it would have violated any treaty which had been concluded with them; that when Robespierre became all powerful, and terror was the order of the day, all former measures were changed, and peace or war made wholly subservient to the ambitious views of that relentless tyrant; that Tallien, having originally belonged to the Mountain, introduced the present system of moderation, not from principle, but only to reconcile the people to his usurped authority, and the fall of his bloody predecessor; that he may suddenly change his measures, or be denounced and executed by the influence of some more daring demagogue, who would again introduce the system of terror; and that in such a state of uncertainty, the only consequence to be expected from making peace at present is, that it would furnish the next faction which may gain the ascendancy in France with an opportunity of attacking the allies when less prepared to receive them. Such reasoning as this has been admitted in the British parliament, where a loan of six millions sterling has been voted to the emperor, to enable him to begin the ensuing campaign with an army of 200,000 men. In what manner the war ought to be conducted, it is not for us to say. The British nation seems to rest its hopes on its superiority at sea; and the greatest exertions are making to augment and man the navy. But we are here under the necessity of dropping this subject, without being able completely to fulfil the promise which we made to our readers at the end of the article FRANCE. There is as little appearance at present of peace, and a steady government being soon restored to that distracted country, as there was at the beginning of the troubles; and there is not the smallest probability that the republican constitution, framed by the convention, will last one year after the dissolution of that assembly.

In tracing the origin and progress of this wonderful revolution, we have consulted every work from which we had reason to look for information, and we have confined ourselves to a simple narration of facts, seldom giving way to the reflections which they suggested. Our facts, too, have been generally stated from writers who are supposed to be not unfriendly to democracy, that they may gain the fuller credit with our own reformers; for in the most favourable point of view in which those facts can be placed, they furnish the strongest objection possible to all their proposed reformations of the British constitution. If the horrible deeds of darkness which have been acted on the theatre of France cannot make us contented with the government under which we live, and which has been brought to its present state of perfection, not by the metaphysical speculations of recluse philosophers, but by observation and the practical experience of ages, we shall be considered by posterity as a people

Revulsion  
Reynolds.

people incapable of instruction, and ripe for the greatest miseries in which we may be involved.

**REVULSION**, in medicine, turning a flux of humours from one part to another by bleeding, cupping, friction, sinapisms, blisters, fomentations, bathings, issues, setons, strong purging of the bowels, &c.

**REYN** (Jan de), an eminent history and portrait painter, born at Dunkirk in 1610. He had the good fortune to be a disciple of Vandyke, was the first performer in his school, and was so attached to his master that he followed him to London, where it is thought he continued as long as he lived. In these kingdoms he is mostly known by the name of *Long Jan*. He died in 1678: and it is imagined that the scarcity of his works is occasioned by so many of them being imputed to Vandyke; a circumstance which, if true, is beyond any thing that could be said in his praise.

**REYNOLDS**, (Sir Joshua) the celebrated painter, was, on July the 16th 1723, born at Plympton, a small town in Devonshire. His father was minister of the parish, and also master of the grammar school; and being a man of learning and philanthropy, he was beloved and respected by all to whom he was known. Such a man, it will naturally be supposed, was assiduous in the cultivation of the minds of his children, among whom his son Joshua shone conspicuous, by displaying at a very early period a superiority of genius, and the rudiments of a correct taste. Unlike other boys, who generally content themselves with giving a literal explanation of their author, regardless of his beauties or his faults, young Reynolds attended to both these, displaying a happy knowledge of what he read, and entering with ardour into the spirit of his author. He discovered likewise talents for composition, and a natural propensity to drawing, in which his friends and intimates thought him qualified to excel. Emulation was a distinguishing feature in his mind, which his father perceived with the delight natural to a parent; and designing him for the church, in which he hoped that his talents might raise him to eminence, he sent him to one of the universities.

Soon after this period he grew passionately fond of painting; and, by the perusal of Richardson's theory of that art, was determined to make it his profession through life. At his own earnest request, therefore, he was removed to London; and about the year 1742 became a pupil to Mr Hudson, who, though not himself an eminent painter, was preceptor to several who afterwards excelled in the art. One of the first advices which he gave to Mr Reynolds was to copy carefully Guercino's drawings. This was done with such skill,

that many of the copies are said to be now preserved in Reynolds's cabinets of the curious as the originals of that very great master.

About the year 1749, Mr Reynolds went to Italy under the auspices, and in the company, of the late Lord (then Commodore) Keppel, who was appointed to the command of the British Squadron in the Mediterranean. In this garden of the world, this magic seat of the arts, he failed not to visit the schools of the great masters, to study the productions of different ages, and to contemplate with unwearied attention the various beauties which are characteristic of each. His labour here, as has been observed of another painter, was "the labour of love, not the task of the hireling;" and how much he profited by it is known to all Europe.

Having remained about two years in Italy, and studied the language as well as the arts of the country with great success, he returned to England, improved by travel and refined by education. On the road to London from the port where he landed, he accidentally found in the inn where he lodged Johnson's life of Savage; and was so taken with the charms of composition, and the masterly delineation of character displayed in that performance, that, having begun to read it while leaning with his arm on the chimney-piece, he continued in that attitude insensible of pain till he was hardly able to raise his hand to his head. The admiration of the work naturally led him to seek the acquaintance of its author, who continued one of his sincerest admirers and warmest friends, till 1784, when they were separated by the stroke of death.

The first thing that distinguished him after his return to his native country, was a full length portrait of Commodore Keppel; which in the polite circles was spoken of in terms of the highest eulogium, and testified to what a degree of eminence he had arrived in his profession. This was followed by a portrait of Lord Edgemoor, and a few others, which soon introduced him to the first beauty in portrait painting; and that branch of the art he cultivated with such success as will for ever establish his name with all descriptions of refined society. Having painted some of the first-rate beauties of the age, the polite world flocked to see the graces and the charms of his pencil; and he soon became the most fashionable painter, not only in England, but in all Europe. He has indeed preserved the resemblance of so many illustrious characters, that we feel the loss of his art leaving left behind him so few historical paintings; though what he has done in that way shows (A) him to have been qualified to excel in both departments. The only landscape, perhaps, which he

(A) As the lovers of painting may wish to have a catalogue of this great master's historical pieces, we subjoin the following from the European Magazine, which we have good reason to believe accurate, as the editors of that miscellany grudge neither trouble nor expence to procure authentic information. Sir Joshua's principal historical pieces, then, are the following: Hope nursing Love; Venus chastising Cupid for having learned to cast accounts; Count Ugolino in the dungeon; the calling of Samuel; Ariadne; a Captain of banditti; Beggar Boy: a Lady in the character of St Agnes; Thais; Dionysius the Areopagite; an infant Jupiter; Master Crewe in the character of Henry VIII.; the death of Dido; a Child asleep; Cupid sleeping; Covent Garden Cupid; Cupid in the Clouds; Cupids painting; Boy laughing; Master Herbert in the character of Bacchus; Hebe; Mrs Meyer in the character of Hebe; Madonna, a head; the Black-guard Mercury; a little Boy (Samuel) praying; an old Man reading; Love loosing the zone of Beauty; the Children in the Wood; Cleopatra

Reynolds. he ever painted, except those beautiful and chaste ones which compose the back grounds of many of his portraits, is "A View on the Thames from Richmond," which in 1784 was exhibited by the Society for Promoting Painting and Design in Liverpool.

In 1764 Mr Reynolds, had the merit of being the first promoter of that club, which, having long existed without a name, became at last distinguished by the appellation of the *Literary Club*. Upon the foundation of the Royal Academy of Painting, Sculpture and Architecture, he was appointed president; and his acknowledged excellence in his profession made the appointment acceptable to all the lovers of art. To add to the dignity of this new institution, his majesty conferred on the president the honour of knighthood; and Sir Joshua delivered his first discourse at the opening of the Academy on January 2. 1769. The merit of that discourse has been universally admitted among painters; but it contains some directions respecting the proper mode of prosecuting their studies, to which every student of every art would do well to pay attention. "I would chiefly recommend (says he), that an implicit obedience to the *rules of art*, as established by the practice of the great masters, should be exacted from the young students. That those models, which have passed through the approbation of ages, should be considered by them as perfect and infallible guides; as subjects for their imitation, not their criticism. I am confident, that this is the only efficacious method of making a progress in the arts; and that he who sets out with doubting, will find life finished before he becomes master of the rudiments. For it may be laid down as a maxim, that he who begins by presuming on his own sense, abandons his studies as soon as he has commenced them. Every opportunity, therefore, should be taken to discontinue that false and vulgar opinion, that rules are the fetters of genius. They are fetters only to men of no genius; as that armour which, upon the strong, becomes an ornament and a defence, upon the weak and misshapen turns into a load, and cripples the body which it was made to protect."

Each succeeding year, on the distribution of the prizes, Sir Joshua delivered to the students a discourse of equal merit with this; and perhaps we do not hazard too much when we say, that, from the whole collected, the lover of belles lettres and the fine arts will acquire juster notions of what is meant by taste in general, and better rules for acquiring a correct taste, than from multitudes of those volumes which have been professedly written on the subject.

In the autumn of 1785 he went to Brussels, where  
Vol. XVI. Part I.

he expended about 1000l. on the purchase of paintings, which, having being taken from the different monasteries and religious houses in Flanders and Germany, were then exposed to sale by the command of the emperor Joseph I. Gainsborough and he had engaged to paint each other's portrait; and the canvas for both being actually stretched, Sir Joshua gave one sitting to his distinguished rival; but, to the regret of every admirer of the art, the unexpected death of the latter prevented all further progress.

In 1790 he was anxiously desirous to procure the vacant professorship of perspective in the academy for Mr Bonomi, an Italian architect; but that artist not having been yet elected an associate, was of course no academician, and it became necessary to raise him to those situations, in order to qualify him for being a professor. Mr Gilpin being his competitor for the associateship, the numbers on the ballot proved equal, when the president by his casting vote decided the election in favour of his friend, who was thereby advanced so far towards the professorship. Soon after this, an academic seat being vacant, Sir Joshua exerted all his influence to obtain it for Mr Bonomi; but finding himself outvoted by a majority of two to one, he quitted the chair with great dissatisfaction, and next day sent to the secretary of the academy a formal resignation of the office, which for twenty-one years he had filled with honour to himself and his country. His indignation, however, subsiding, he suffered himself to be prevailed upon to return to the chair, which within a year and a half he was again desirous to quit for a better reason.

Finding a disease of languor, occasioned by an enlargement of the liver, to which he had for sometime been subject, increase upon him, and daily expecting the total loss of sight, he wrote a letter to the academy, intimating his intention to resign the office of president on account of bodily infirmities, which disabled him from executing the duties of it to his own satisfaction. The academicians received this intelligence with the respectful concern due to the talents and virtues of their president; and either then did enter, or designed to enter, into a resolution, honourable to all parties, namely, that a deputation from the whole body of the academy should wait upon him, and inform him of their wish, that the authority and privileges of the office of president might be his during his life; declaring their willingness to permit the performance of any of its duties which might be irksome to him by a deputy.

From this period Sir Joshua never painted more. The last effort of his pencil was the portrait of the Honourable Charles James Fox, which was executed in his

C c

bed

patra dissolving the Pearl; Garrick in the character of Kiteley; Garrick between Tragedy and Comedy; Mrs Abingdon in the character of Comedy; a Child surrounded by Guardian Angels; Miss Beauchere in the character of Spenser's Una; Resignation; the Duchess of Manchester in the character of Diana; Lady Blake in the character of Juno; Mrs Sheridan in the character of St Cecilia; Edwin, from Beattie's Minstrel; the Nativity, Four Cardinal Virtues, and Faith, Hope, and Charity, for the window of New College Chapel, Oxford; the Studious Boy; a Bacchante; a daughter of Lord W. Gordon as an Angel; the Holy Family, the Cottagers, from Thomson; the Vestal; the Careful Shepherdess; a Gypsy telling Fortunes; the infant Hercules strangling the Serpent; the Mouse-trap girl; Venus; Cornelia and her Children; the Bird; Melancholy; Mrs Siddons in Tragedy; Head of Lear; Mrs Talmash in the character of Miranda, with Prospero and Caliban; Robin Goodfellow; Death of Cardinal Beaufort; Macbeth with the Caldron of the Witches.

Reynolds. best style, and shows that his fancy, his imagination, and his other great powers in the art which he professed, remained unabated to the end of his life. When the last touches were given to this picture,

"The hand of Reynolds fell, to rise no more."

On Thursday February the 23d 1792, the world was deprived of this amiable man and excellent artist at the age of 68 years; a man than whom no one, according to Johnson, had passed through life with more observation of men and manners. The following character of him is said to be the production of Mr Burke:

"His illness was long, but borne with a mild and cheerful fortitude, without the least mixture of any thing irritable or querulous, agreeably to the placid and even tenor of his whole life. He had from the beginning of his malady a distinct view of his dissolution, which he contemplated with that entire composure which nothing but the innocence, integrity, and usefulness of his life, and an unaffected submission to the will of Providence, could bestow. In this situation he had every consolation from family tenderness, which his tenderness to his family had always merited."

"Sir Joshua Reynolds was, on very many accounts, one of the most memorable men of his time: He was the first Englishman who added the praise of the elegant arts to the other glories of his country. In taste, in grace, in facility, in happy invention, and in the richness and harmony of colouring, he was equal to the great masters of the renowned ages. In portrait he went beyond them; for he communicated to that description of the art in which English artists are the most engaged, a variety, a fancy, and a dignity, derived from the higher branches, which even those who professed them in a superior manner did not always preserve when they delineated individual nature. His portraits remind the spectator of the invention of history and the amenity of landscape. In painting portraits, he appears not to be raised upon that platform, but to descend to it from a higher sphere. His paintings illustrate his lessons, and his lessons seem to be derived from his paintings."

"He possessed the theory as perfectly as the practice of his art. To be such a painter, he was a profound and penetrating philosopher."

"In full happiness of foreign and domestic fame, admired by the expert in art, and by the learned in science, courted by the great, caressed by sovereign powers, and celebrated by distinguished poets, his native humility, modesty, and candour, never forsook him, even on surprise or provocation; nor was the least degree of arrogance or assumption visible to the most scrutinizing eye in any part of his conduct or discourse."

"His talents of every kind—powerful from nature, and not meanly cultivated in letters—his social virtues in all the relations and all the habits of life, rendered him the centre of a very great and unparalleled variety

of agreeable societies, which will be dissipated by his death. He had too much merit not to excite some jealousy, too much innocence to provoke any enmity. The loss of no man of his time can be felt with more sincere, general, and unmixed sorrow."

REZAN, or REZANSKOI, an ancient town of Russia, and capital of a duchy of the same name, with an archbishop's see. It was formerly considerable for its extent and riches; but it was almost ruined by the Tartars in 1568. The country is populous, and was formerly governed by its own princes. E. Long. 42. 37. N. Lat. 54. 54.

RHADAMANTHUS, a severe judge, and king of Lydia; the poets make him one of the three judges of hell.

RHAGADES, in medicine, denotes chaps or clefts in any part of the body. If seated in the anus, and recent, the patient must sit still, and sit over the steam of warm water. The epulotic cerate may also be applied. If the lips of these fissures are callous, they must be cut or otherwise treated as to become new ulcerations.

RHAMA, or RAMA, an incarnate deity of the first rank, in Indian mythology. Sir William Jones believes he was the Dionysos (A) of the Greeks, whom they named *Bromius*, without knowing why; and *Eugenes*, when they represented him *horned*, as well as *I-yaios* and *Eleutherios* the deliverer, and *Triambos* or *Dythyrambos* the triumphant.

"Most of those titles (says Sir William) were adopted by the Romans, by whom he was called *Bruma*, *Tauris* for *searcher*, *mis*, *Liber*, and *Triumphus*; and both nations had records or traditional accounts of his giving laws to men and deciding their contents, of his improving navigation and commerce, and, what may appear yet more observable, of his conquering India and other countries with an army of satyrs, commanded by no less a personage than Pan; whom Lilius Giraldus, on what authority I know not, asserts to have resided in Iberia 'when he had returned, says the learned mythologist, from the Indian war, in which he accompanied Bacchus.' It were superfluous in a mere essay to run any length in the parallel between this European god and the sovereign of Ayodhya, whom the Hindoos believe to have been an appearance on earth of the preserving power; to have been a conqueror of the highest renown, and the deliverer of nations from tyrants, as well as of his consort Sita from the giant Ravan king of Lanka; and to have commanded in chief a numerous and intrepid race of those large monkeys, which our naturalists, or some of them, have denominated Indian satyrs: his general, the prince of satyrs, was named *Hanumat*, or 'with high cheek bones;' and, with workmen of such agility, he soon raised a bridge of rocks over the sea, part of which, say the Hindoos, yet remains; and it is probably the series of rocks to which the Mussulmans or the Portuguese have given the foolish name of *Adam's* (it should be called *Rama's*) bridge. Might not this army

Rezan  
Rhania.

(A) The learned president, whose death will be lamented by every scholar, by the orientalist and the divine especially, imagines, that this would fully appear from comparing together the *Dionysia* of Nonnus and the *Ramayana* of Valmiki, the first poet of the Hindoos. He adds, that, in his opinion, Rhama was the son of Cuth, and that he might have established the first regular government in that part of Asia, in which his exploits are said to have been performed.

Rhama, army of satyrs have been only a race of mountaineers, whom Rama, if such a monarch ever existed, had civilized: However that may be, the large breed of Indian apes is at this moment held in high veneration by the Hindoos, and fed with devotion by the Brahmans, who stem in two or three places on the banks of the Ganges to have a regular endowment for the support of them: they live in tribes of three or four hundred, are wonderfully gentle (I speak as an eye-witness), and appear to have some kind of order and subordination in their little sylvan polity." The festival of Rhama is held on the 9th day of the new moon of Chaitra, on which the war of Lanka is dramatically represented, concluding with an exhibition of the fire ordeal, by which the victor's wife Sita gave proof of her connubial fidelity. Among the Hindoos there are a variety of very fine dramas of great antiquity on the story of Rhama.

There are three Rhamas mentioned in the Indian mythology, who, together with Krishna, the darling god of the Indian women, are described as youths of perfect beauty. The third Rhama is Krishna's elder brother, and is considered as the eighth Avatar (a), invested with an emanation of his divine radiance. Like all the Avatars, Rhama is painted with gemmed Ethiopian or Parthian coronets: with rays encircling his head, jewels in his ears, two necklaces, one straight and one pendant on his bosom, with dropping gems; garlands of well-disposed many-coloured flowers, or collars of pearls, hanging down below his waist; loose mantles of golden tissue or dyed silk, embroidered on the hems with flowers elegantly thrown over one shoulder, and folded like ribbands across the breast; with bracelets, two on one arm and on each wrist: all the Avatars are naked to the waists, and uniformly with dark azure flesh, in allusion probably to the tint of that primordial fluid on which Narayan moved in the beginning of time; but their skirts are bright yellow, the colour of the curious pericarpium in the centre of the water-lily.

**RHAMNUS**, the BUCKTHORN, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 43d order, *Dumet.* The calyx is tubulous, with five minute scales surrounding the stamina; there is no corolla; the fruit is a berry. There are 27 species; of which the most remarkable are,

1. The catharticus, or common purging buckthorn, growing naturally in some parts of Britain. This grows to the height of 12 or 14 feet, with many irregular branches at the extremities. The leaves are oval-lanceolate, finely serrated on the edges, their nerves converging together. The flowers grow in clusters, one on each footstalk, white, and in this species divided into four segments: the fruit is a round black berry, containing four seeds. The juice of the berries is a

strong purgative, and is made use of for making the common syrup of buckthorn kept in the shops. The bark is emetic; the juice of the unripe berries with alum dyes yellow, of the ripe ones a fine green; the bark also dyes yellow. The green colour yielded by the berries, called by the French *verde vessie*, is much esteemed by miniature painters.

Of this species there are two varieties, viz. the dwarf buckthorn, a shrub of about a yard high, of a greenish colour but little show; and the long-leaved dwarf buckthorn, which is a larger shrub, with leaves somewhat larger, but in other respects very similar to the dwarf buckthorn.

2. The zizyphus is the species in which the lac insect \* forms its cells, and produces the wax called gum-lac. See LACCA.

3. The lotus has the leaves, prickles, flowers, and fruit, of the zizyphus or jube; only with this difference, that the fruit is here round, smaller, and more luscious, and at the same time the branches, like those of the paliurus, are neither so much jointed nor crooked. The fruit is in great repute, tastes something like gingerbread, and is sold in the markets all over the southern districts of these kingdoms. The Arabs call it *aneb enta el seedra*, or *the jube of the seedra*; which Olavius Celsus had so high an opinion of, that he has described it as the dudaim of the scriptures. This species is very common in the Jereede and other parts of Bombay; and has been supposed by some to be the same plant with that celebrated by Homer for its enchanting property; though the latter is more generally supposed to have been a species of *Diospyros* (which see). It is proper, however, to distinguish between both these shrubs and an herb often mentioned by the ancients under the name of *lotus*, which Homer mentions as being fed upon by the horses of Achilles, and Virgil as proper to increase the milk of sheep (see *Lorvus*). They are also different from the Egyptian lotus described by Herodotus; for which see *Nymphaea*.

4. The frangula, or berry-bearing alder, is a deciduous shrub, a native of England and most of the northern parts of Europe, and affords several varieties.

5. The Alpine, rough-leaved frangula, or berry-bearing alder, is also a deciduous shrub, and native of the Alps. It differs in no respect from the common sort, except that it has no thorns, and that it will grow to be rather taller, with tough, large, and doubly lacinated leaves. The smooth-leaved Alpine frangula is a variety of this species, with smooth leaves and of a lower growth.

6. The paliurus, or thorn of Christ, is a deciduous shrub or tree, a native of Palestine, Spain, Portugal, and Italy. It will grow to nearly the height of 14

C c 2 feet,

(a) *Avatar* means the descent of the deity in his capacity of preserver. The three first of these descents relate to some stupendous convulsions of our globe from the fountains of the deep, and the fourth exhibits the miraculous punishment of pride and impiety, appearing to refer to the deluge. Three of the others were ordained for the overthrow of tyrants or giants. Of these Avatars we have mentioned in the text, that Rhama is the eighth; Buddha, who appears to have been a reformer of the doctrines contained in Veda, is the ninth: the tenth Avatar, we are told, is yet to come, and is expected to appear mounted (like the crowned conqueror in the Apocalypse) on a white horse, with ascimeter blazing like a comet, to mow down all incorrigible and impetuous offenders who shall then be on the earth.

**Rhamnus**, feet, and is armed with sharp thorns, two of which are at each joint, one of which is about half an inch long, straight, and upright; the other is scarcely half that length, and bent backward and between them is the bud for next year's shoot. June is the time of flowering, and the flowers are succeeded by a small fruit, surrounded by a membrane. "This plant (says Hanbury) is undoubtedly the sort of which the crown of thorns for our Blessed Saviour was composed. The branches are very pliant, and the spines of it are at every joint strong and sharp. It grows naturally about Jerusalem, as well as in many parts of Judæa; and there is no doubt that the barbarous Jews would make choice of it for their cruel purpose. But what farther confirms the truth of these thorns being then used, are the ancient pictures of our Blessed Saviour's crucifixion. The thorns of the crown on his head exactly answer to those of this tree; and there is great reason to suppose these were taken from the earliest paintings of the Lord of Life: and even now our modern painters copy from them, and represent the crown as composed of these thorns. These plants, therefore, should principally have a share in those parts of the plantation that are more peculiarly designed for religious retirement: for they will prove excellent monitors, and conduce to due reflection on and gratitude to 'Him who hath loved us, and has washed us from our sins,' &c.

7. The common alaternus is an evergreen tree, and native of the south of Europe. There are several varieties of this species; the most remarkable of which are the broad-leaved and the jagged-leaved alaternus, which have all been confounded with the phillyrea.

8. The insectorius, or narrow-leaved buckthorn, is an evergreen shrub or tree, and native of Spain. It grows to the height of 10 or 12 feet, and sends forth several branches from the bottom to the top. They are covered with a blackish or dark-coloured bark, and each of them is terminated by a long sharp thorn. The fruit continues on the trees all winter, making a beautiful appearance among the narrow-clustered leaves at that season.

9. The oleoides, or olive-leaved buckthorn, is an evergreen shrub, and native of Spain, and grows to the height of 8 or 10 feet. It sends forth numerous branches, each of which is terminated by a long sharp spine. The flowers are small, of a whitish green colour, and are succeeded by round black berries.

**RHAMPHASTOS**, in ornithology, a genus belonging to the order of picæ. The bill is very large, and serrated outwardly. The nostrils are situated behind the base of the beak; and in most of the species the feet are toed, and placed two forwards and two backwards. The tongue is long, narrow, and feathered on the edges. Mr Latham enumerates 15 different species; of which the toucans are the most remarkable; and were formerly divided into four or five varieties, though Mr Latham makes them distinct species, of which we shall only describe that called the red-beaked toucan.

**Plate** This bird is about the size of a jackdaw, and of a similar shape, with a large head to support its monstrous bill: this bill, from the angles of the mouth to its point, is six inches and a half; and its breadth in the thickest part is a little more than two. Its thickness

near the head is one inch and a quarter: and it is a little rounded along the top of the upper chap, the under side being round also

**Rhamphastos**

upper chap is of a bright yellow, except on each side, which is of a fine scarlet colour; as is also the lower chap, except at the base, which is purple. Between the head and the bill there is a black line of separation all round the base of the bill; in the upper part of which the nostrils are placed, and are almost covered with feathers; which has occasioned some writers to say that the toucan has no nostrils. Round the eyes, on each side of the head, is a space of bluish skin, void of feathers; above which the head is black, except a white spot on each side joining to the base of the upper chap. The hinder part of the neck, the back, wings, tail, belly, and thighs, are black. The under side of the head, throat, and the beginning of the breast, are white. Between the white on the breast, and the black on the belly, is a space of red feathers, in the form of a new moon, with its horns upwards. The legs, feet, and claws, are of an ash-colour; and the toes stand like those of parrots, two before and two behind.

It is reported by travellers, that this bird, though furnished with so formidable a beak, is harmless and gentle, being so easily made tame as to sit and hatch its young in houses. It feeds chiefly upon pepper, which it devours very greedily, gorging itself in such a manner that it voids it crude and uncooked. This, however, is no objection to the natives from using it again: they even prefer it before that pepper which is fresh gathered from the tree; and seem persuaded that the strength and heat of the pepper is qualified by the bird, and that all its noxious qualities are thus exhausted.

Whatever be the truth of this report, nothing is more certain than that the toucan lives only upon vegetable diet; and in a domestic state, to which it is frequently brought in the warm countries where it is bred, it is seen to prefer such food to all other. Pozzo, who bred one tame, asserts, that it leaped up and down, wagged the tail, and cried with a voice resembling that of a magpie. It fed upon the same things that parrots do; but was most greedy of grapes, which, being plucked off one by one, and thrown in the air, it would most dexterously catch before they fell to the ground. Its bill, he adds, was hollow, and upon that account very light, so that it had but little strength in so apparently formidable a weapon; nor could it peck or strike smartly therewith. But its tongue seemed to assist the efforts of this unwieldy machine: it was long, thin, and flat, not unlike one of the feathers on the neck of a dunhill cock; this it moved up and down, and often extended five or six inches from the bill. It was of a flesh colour, and remarkably fringed on each side with very small filaments, exactly resembling a feather.

It is probable that this long tongue has greater strength than the thin hollow beak that contains it. It is likely that the beak is only a kind of sheath for this peculiar instrument, used by the toucan, not only in making itself a nest, but also in obtaining its provision. Nothing is more certain, than that this bird builds its nest in holes of trees, which have been previously

**Rhapia** viciously scooped out for this purpose, and it is not very likely that so feeble a bill could be very serviceable in working upon such hard materials.

**Rhapsody.** Be this as it will, there is no bird secures its young better from external injury than the toucan. It has not only birds, men, and serpents, to guard against; but a numerous tribe of monkeys, still more prying, mischievous, and hungry, than all the rest. The toucan, however, scoops out its nest into the hollow of some tree, leaving only a hole large enough to go in and out at. There it sits, with its great beak, guarding the entrance; and if the monkey ventures to offer a visit of curiosity, the toucan gives him such a welcome, that he presently thinks proper to pack off, and is glad to escape with safety.

This bird is only found in the warm climates of South America, where it is in great request, both for the delicacy of its flesh, which is tender and nourishing, and for the beauty of its plumage, particularly the feathers of the breast. The skin of this part the Indians pluck off, and when dry glue to their cheeks; and thus they consider as an incredible addition to their beauty.

**RHAPIS**, in botany: A genus of the monogynia order, belonging to the hexandria class of plants; and in the natural method ranking under the first order, *Palmæ*. The calyx is a monophyllous trifid spatha; the corolla monopetalous and trifid. There are two species, viz. 1. *Flabilliformis*, or ground-ratan, a native of China; 2. *Arundinacea*, simple leaved rhaps, a native of Carolina.

**RHAPSODI**, **RHAPSONISTS**, in antiquity, persons who made a business of singing pieces of Homer's poems. Cuper informs us, that the Rhapsodi were clothed in red when they sung the Iliad, and in blue when they sung the Odyssey. They performed on the *lyra*, and sometimes strove for prizes in contests of singing, &c. After the two antagonists had finished their parts, the two pieces or papers they were singing in were joined together again: whence the words, *from ~~gemma~~ <sup>gemma</sup> ~~sup~~ <sup>sup</sup> and ~~canticum~~ <sup>canticum</sup>*: but there have been other Rhapsodi of more antiquity than these people, who composed heroic poems or songs in praise of heroes and great men, and sung their own compositions from town to town for a livelihood; of which perhaps Homer himself might have been. See **BARD**.

**RHAPSODOMANCY**, a sort of divination performed by pitching on a verse of a poet at hazard, and reckoning on it as a prediction of what was to come to pass. There were various ways of practising this rhapsodomancy. Sometimes they wrote several papers or sentences of a poet on so many pieces of wood, paper, or the like, shook them together in an urn, and drew out one which was accounted the lot: sometimes they cast dice on a table whereon verses were written, and that whereon the die lodged contained the prediction. A third manner was by opening a book, and pitching on some verse at first sight. This method they particularly called the *sortes Prænestinae*; and afterwards, according to the poet made use of, *sortes Homericae*, *sortes Virgilianæ*, &c. See **Sortes**.

**RHAPSODY**, in antiquity, a discourse in verse sung or rehearsed by a rhapsodist. Others will have rhapsody to signify a collection of verses, especially

those of Homer, which having been a long time dispersed in pieces and fragments, were at length by Pistratus's order digested into books called *rhapsodies*, from *gemma suo*, and *oda canticum*. Hence, among moderns, *rhapsody* is also used for an assemblage of passages, thoughts, and authorities, raked together from divers authors, to compose some new piece.

**RHE**, or **Réz**, a little island in the bay of Biscay, near the coast of Anjou in France. It was taken during the war with France which ended in 1763, in the expedition commanded by Hawke and Mordaunt.

**RHEA AMERICANA**. The American ostrich of authors has been frequently mentioned, but till of late years very imperfectly known; being blended by some with other genera, although forming of itself a distinct one, differing in many things from all others. The older writers, however, have kept it separate. It does not occur to us whether any author has figured this bird except *Niemburg*, whose representation conveys no just idea, which is wonderful, as it is to be met with in sufficient plenty in various parts of South America; nor has the bird itself made its appearance in the cabinets of collectors, until the one now in the Leverian museum.

M. Bajou, in his *Mem. sur Cayenne*, gives a figure and description of the jabirus, and seems clear that this bird is no other than the ostrich of America. From this assertion, Mr Latham, in his *Synopsis*, leaves the matter undecided; but this author, in his *Index Ornithol.* from having met with the specimen above alluded to, and supported in an account of its manners given by Molina in his *Hist. Nat. du Chili*, treats this matter on more certain grounds, so as to enable us to give the following description.

In size the American ostrich is very little inferior to the common one: the bill is sloped not unlike that of a goose, being flat on the top and rounded at the end: the eyes are black, and the lids furnished with hairs: the head is rounded, and covered with downy feathers: the neck is two feet eight inches long, and feathered also: from the tip of one wing to that of the other extended, the length is eight feet; but from the want of continuity of the webs of the feathers, and their laxity of texture, the bird is unable to raise itself from the ground; it is, however, capable of greatly assisting itself by their motion in running, which it does very swiftly: the legs are stout, bare of feathers above the knees, and furnished with three toes, all placed forwards, each having a straight and stout claw as in the cassowary; on the heel is a callous knob, serving in place of a back toe: the general colour of plumage is dull gray mixed with white, inclining to the latter on the under parts: the tail is very short, and not conspicuous, being entirely covered with long loose and floating feathers, having origin from the lower part of the back and rump, and entirely covering it: the bill and legs are brown.

Molina observes that this bird varies; the body in some being white, in others black. In respect to manners, it is said to be a general feeder, but more fond of flies, which it catches with great dexterity, and will also, like the common ostrich, swallow bits of iron and any other trash offered to it. In common with the ostrich of the old world, it lays a number of eggs, from 40 to 60, in the sand, each of them holding a quart;

Rho.  
Rhea.

but.

Rheedia  
Rhetores.

but it differs from that bird in many particulars, especially in wanting the callosity on the sternum, and spurs on the wing. With these last the common ostrich is known to defend itself: in defect of them, the one here treated of uses the feet with such address as to become at once a furious and dangerous antagonist. The female calls its young ones together with a kind of whistling note somewhat similar to that of a man: when young it is very tame, frequently following the first creature it meets with. The flesh of this bird is said to be very unpalatable. It is found in various parts of South America, from Patagonia to Guiana; and is known by the name of *Choique*. We are happy to be able to present our readers with an accurate drawing of the bird. See Plate CCCCXXXVII.

**RHEEDIA**, in botany: A genus of the monogynia order, belonging to the polyandria class of plants; and in the natural method ranking with those of which the order is doubtful. The corolla is tetrapetalous; there is no calyx; and the fruit is a trispermous berry.

**RHEGIUM** (anc. geog.), so very ancient a city as to be supposed to take its name from the violent bursting of the coast of Italy from Sicily; thought to have been formerly conjoined (Mela, Virgil). A city of the Bruttii, a colony of Chalcidians from Eubœa: a strong barrier opposed to Sicily (Strabo); mentioned by Luke; surnamed *Julium* (Ptolemy), from a fresh supply of inhabitants sent thither by Augustus, after driving Sextus Pompeius out of Sicily (Strabo); and thus was in part a colony, retaining still the right of a municipium (Inscription). The city is now called *Reggio*, in the Farther Calabria.

**RHEIMS**, a city of France in Champagne, and capital of the Rhemois. It is one of the most ancient, celebrated, and largest places in the kingdom, had an archbishop's see, whose archbishop was a duke and peer of France. It is about four miles in circumference, and contains several fine squares, well-built houses, and magnificent churches. It had a mint, a university, and five abbeys, the most famous of which was that of St Remy. There are also several triumphal arches and other monuments of the Romans. It is seated on the river Vesle, on a plain surrounded by hills, which produce excellent wine. E. Long. 4. 8. N. Lat. 49. 14.

**RHENISH WINE**, that produced on the hills about Rheims. This wine is much used in medicine as a solvent of iron, for which it is well calculated on account of its acidity. Dr Percival observes, that it is the best solvent of the Peruvian bark; in which, however, he thinks its acidity has no share, because an addition of vinegar to water does not augment its solvent power.

**RHETORES**, amongst the Athenians, were ten in number, elected by lot to plead public causes in the senate house or assembly. For every cause in which they were retained, they received a drachm out of the public money. They were sometimes called *Συνήγοροι*, and their fee *το Συναγωγικόν*. No man was admitted to this office before he was 40 years of age, though others say 30. Valour in war, piety to their parents, prudence in their affairs, frugality, and temperance, were necessary qualifications for this office, and every candidate underwent an examination concerning these virtues previous to the election. The orators at Rome

were not unlike the Athenian rhetores. See ORATORS.

**RHETORIANS**, a sect of heretics in Egypt, so denominated from Rhetorius their leader. The distinguishing tenet of this heresiarch, as represented by Philastrius, was, that he approved of all the heresies before him, and taught that they were all in the right.

**RHETORIC**, the art of speaking copiously on any subject, with all the advantages of beauty and force. See ORATORY.

**RHEUM**, a thin serous humor, occasionally oozing out of the glands about the mouth and throat.

**RHIZOM**, *Rhubarb*: A genus of the monogynia order, belonging to the enneandria class of plants; and in the natural method ranking under the 12th order, *Holoraceæ*. There is no calyx; the corolla is sexfid and persistent; and there is one triquetrous seed. There are five species, viz. 1. The rhaponticum, or common rhubarb, hath a large, thick, fleshy, branching, deeply-striking root, yellowish within; crowned by very large, roundish, heart-shaped smooth leaves, on thick, slightly furrowed footstalks; and an upright strong stem, two or three feet high, adorned with leaves singly, and terminated by thick close spikes of white flowers. It grows in Thrace and Scythia, but has been long in the English gardens. Its root affords a gentle purge. It is however of inferior quality to some of the following sorts; but the plant being astringent, its young stalks in spring, being cut and peeled, are used for tartar. 2. The palmatum, palmated leaved true Chinese rhubarb, hath a thick fleshy root, yellow within; crowned with very large palmated leaves, being deeply divided into acuminate segments, expanded like an open hand; upright stems, five or six feet high or more, terminated by large spikes of flowers. This is now generally esteemed to be the true foreign rhubarb, the purgative quality of which is well known. 3. The compansum, or Tartarian rhubarb, hath a large, fleshy, branched root, yellow within; crowned by very large, heart-shaped, somewhat lobated, sharply indented, smooth leaves, on an upright large stem, five or six feet high, adorned with leaves singly, and branching above; having all the branches terminated by nodding panicles of white flowers. This has been supposed to be the true rhubarb, which, however, though it is reputed to be of some sorts, is accounted inferior to the rheum palmatum. 4. The undulatum, or wave-leaved Chinese rhubarb, hath a large, branching, deep-striking root, yellow within; crowned with large, oblong, undulate, somewhat hairy leaves, having equal footstalks, and an upright firm stem, four feet high; garnished with leaves singly, and terminated by long loose spikes of white flowers. 5. The Arabian ribes, or currant rhubarb of Mount Libanus, hath a thick fleshy root, very broad leaves, full of granulated protuberances, and with equal footstalks, and upright firm stems, three or four feet high, terminated by spikes of flowers, succeeded by berry-like seeds, being surrounded by a purple pulp. All these plants are perennial in root, and the leaves and stalks are annual. The roots being thick, fleshy, generally divided, strike deep into the ground; of a brownish colour without and yellow within: the leaves rise in the spring, generally come up in a large head folded together,

Rheum.

Rheum. together, gradually expanding themselves, having thick footstalks; and grow from one to two feet high, or more, in length and breadth, spreading allround: amidst them rise the flower-stems, which are garnished at each joint by one leaf, and are of strong and expeditious growth, attaining their full height in June, when they flower; and are succeeded by large triangular seeds, ripening in August. Some plants of each sort merit culture in gardens for variety; they will effect a singularity with their luxuriant foliage, spikes, and flowers: and as medical plants, they demand culture both for private and public use.

They are generally propagated by seeds sowed in autumn soon after they are ripe, or early in the spring, in any open bed of light deep earth; remarking, those intended for medical use should generally be sowed where they are to remain, that the roots, being not disturbed by removal, may grow large. Scatter the seeds thinly, either by broad cast all over the surface, and raked well in; or in shallow drills a foot and half distance, covering them near an inch deep. The plants will rise in the spring, but not flower till the second or third year: when they, however, are come up two or three inches high, thin them to eight or ten inches, and clear out all weeds; though those designed always to stand should afterwards be hoed out to a foot and a half or two feet distance: observing, if any are required for the pleasure ground, &c. for variety, they should be transplanted where they are to remain in autumn, when their leaves decay, or early in spring, before they shoot; the others remaining where sowed, must have the ground kept clean between them; and in autumn, when the leaves and stalks decay, cut them down, and slightly dig the ground between the rows of plants, repeating the same work every year. The roots remaining, they increase in size annually: and in the second or third year some of them will shoot up stalks, flower, and perfect seed; and in three or four years the roots will be arrived at a large size; though older roots are generally preferred for medical use.

Mr. Ellis's Travels we have an account of some particulars relating to the culture of rhubarb. He says, that the best rhubarb grows in that part of Tartary called Khorasan, which now serves as a boundary between Russia and China. The man-moles contribute greatly to the culture of the rhubarb. When they go to an old mine growing, you are sure to find many holes, and the roots of their broad ascending leaves. These man-moles eat the leaves and roots of the rhubarb; and it is probable the manure they leave about the roots contributes not a little to its increase; and their casting up the earth, makes it shoot out young buds and multiply. This plant does not run, and spread itself, like docks and others of the same species; but grows in tufts, at uncertain distances, as if the seeds had been dropped with design. It appears that the Mongals never accounted it worth cultivating; but that the world is obliged to the manmots for the quantities scattered, at random, in many parts of this country: for whatever part of the ripe seed happens to be blown among the thick grass, can very seldom reach the ground, but must there wither and die; whereas, should it fall among the loose earth thrown up by

the marmots, it immediately takes root, and produces a new plant.

After digging and gathering the rhubarb, the Mongals cut the large root into small pieces, in order to make them dry more readily. In the middle of every piece they scoop a hole, through which a cord is drawn, in order to suspend them in any convenient place. They hang them for the most part about their tents, and sometimes on the horns of their sheep. This is a most pernicious custom, as it destroys some of the best part of the root: for all about the hole is rotten and useless; whereas, were people rightly informed how to dig and dry this plant, there would not be one pound of refuse in a hundred, which would save a great deal of trouble and expence, that much diminish the profits on this commodity. At present, the dealers in this article think these improvements not worthy of their attention, as their gains are more considerable on this than on any other branch of trade. Perhaps the government may hereafter think it proper to make some regulations with regard to this matter.

Two sorts of rhubarb are met with in the shops. The first is imported from Turkey and Russia, in roundish pieces freed from the bark, with a hole through the middle of each: they are externally of a yellowish colour, and on cutting appear variegated with lively reddish streaks. The other, which is less esteemed, comes immediately from the East Indies, in longish pieces, harder, heavier, and more compact than the foregoing. The first sort, unless kept very dry, is apt to grow mouldy and worm-eaten; the second is less subject to these inconveniences. Some of the more industrious artists are said to fill up the worm-holes with certain mixtures, and to colour the outside of the damaged pieces with powder of the finer sorts of rhubarb, and sometimes with cheaper materials: this is often so nicely done, as effectually to impose upon the buyer, unless he very carefully examines each piece. The marks of good rhubarb are, that it be firm and solid, but not stinty; that it be easily pulverable, and appear, when powdered, of a fine bright yellow colour: that, upon being chewed, it impart to the spittle a saffron tinge, without proving slimy or mucilaginous in the mouth. Its taste is subacid, bitterish, and somewhat astringent; the smell lightly aromatic.

Rhubarb is a mild cathartic, which operates without violence or irritation, and may be given with safety even to pregnant women and children. Besides its purgative quality, it is celebrated for an astringent one, by which it strengthens the tone of the stomach and intestines, and proves useful in diarrhoeas and disorders proceeding from a laxity of the fibres. Rhubarb in substance operates more powerfully as a cathartic than any of the preparations of it. Watery tinctures purge more than the spirituous ones; whilst the latter contain in greater perfection, the aromatic, astringent, and corroborating virtues of the rhubarb. The dose, when intended as a purgative, is from a scruple to a dram or more.

The Turkey rhubarb is, among us, universally preferred to the East India sort, though this last is for some purposes at least equal to the other; it is manifestly more astringent, but has somewhat less of an aromatic flavour. Tinctures drawn from both with rectified spirit have nearly the same taste: on distilling off

Rheum.

*Rheum.* off the menstruum, the extract left from the tincture of the East India rhubarb proved considerably the strongest.

Rhubarb has been cultivated of late in this country with considerable success, and for medical purposes is found to equal that of foreign growth, as is proved by the Transactions of the London Society for encouraging Arts, Manufactures, and Commerce, who have rewarded several persons both for cultivating and curing it. In the Transactions for 1792, the gold medal was adjudged to Sir William Fordyce, for raising from seed in the year 1791 upwards of 300 plants of the true rhubarb, or *rheum palmatum* of the London Pharmacopœia 1788, which in the second and third weeks of October were transplanted into a deep loam, at four feet distance from each other, according to rules laid down by the society. In 1793 it was adjudged to Mr Thomas Jones, from whose papers we derive the following information.

After giving an accurate account of his experiments and observations, he concludes, that the season for sowing is the spring about March or April, or in autumn about August and September: that those plants which are raised in the spring should be transplanted in autumn, and *vice versa*; that they cannot have too much room; that room and time are essentially necessary to their being large, of a good appearance, and perhaps to the increase of their purgative qualities; that to effect these purposes, the soil must be light, loamy, and rich, but not too much so, lest the roots should be too fibrous; that their situation can scarcely be too dry, as more evils are to be expected from a superabundance of moisture than any actual want of it: and lastly, we may conclude, that in particular the injuries which they are subject to are principally during their infancy, and to be imputed to insects and inattention to the planting season; afterwards, from too great an exposure to frost; but that none can be dreaded from heat; and that in general they are hardy and easy of cultivation, when arrived beyond a certain term.

The method of curing rhubarb, as proposed by Dr Tirruogel of Stockholm, is as follows: "No roots should be taken up till they have been planted ten years: they should be taken out of the ground either in winter, before the frost sets in, or in the beginning of spring, and immediately cut into pieces, and carefully barked; let them be spread upon a table for three or four days, and be frequently turned, that the juices may thicken or condense within the roots. After this process, make a hole in each piece, and put a thread through it, by which let them hang separately, either within doors, or in some sheltered shady shed. Some persons dry them in a different way: they enclose the roots in clay, and make a hole in the clay, about the thickness of a goose-quill, and in this manner hang up each piece to dry separately, that the moisture may not evaporate, nor the strength of the root be weakened. But the method which the Tartars follow is a bad one; they dig the roots out of the deserts where they grow, bark them, and immediately string them, and hang them round the necks of their camels, that they may dry as they travel; but this greatly lessens the medicinal virtue of the root."

Mr Thomas Halley of Pontefract in Yorkshire, to whom the London Society voted the silver medal in

1793, informs us, that his father tried various experiments for curing rhubarb, as washing, brushing, barking, and peeling, and he dried them in the sun, on a kiln, in a stove, or in a warm kitchen. But of the success of all or either of these methods we have no account, owing to the death of Mr Halley's father. He sent, however, to them five different specimens, which the Society acknowledges to be superior to any rhubarb hitherto cured in England, and produced to them. The roots sent, Mr Halley says, were planted about the year 1781 in a light sandy soil, but were much neglected. They were taken up in the spring of 1792, and being thoroughly divested of the adhering earth, were placed for some weeks on the floor of a cool warehouse: the fibres were then taken off, cut up, and dried on the floor of a green-house; but, from mismanagement, were entirely spoiled. The prime roots were severed in small pieces, peeled clean, and thoroughly cleared of every particle of unsoundness. Part was separately laid in sieves, and the remainder perforated, strung, and suspended in skeins from the ceiling of a warm kitchen. The manner of dressing consists in paring off the external coat with a sharp knife, as thin and clean as possible, and then finishing it off by a piece of fish skin, with its own powder; which powder may be procured from the chips and small pieces, either by grinding or pounding it in a large mortar.

In the year 1794 the Society adjudged the gold medal to Mr William Hayward of Hanbury, Oxfordshire, for propagating rhubarb by offsets taken from the crowns of large plants, instead of seeds, for the purpose of bringing it to perfection in a shorter time, which fully answered his expectations. Mr Hayward was candidate in the year 1789 for the gold medal, but having misunderstood their rules, he was not entitled to it, though with great propriety they voted to him the silver medal; in consequence of which he sent them the method of culture and cure. His method of cultivating Turkey rhubarb from seed is thus explained to the Society: "I have usually sown the seed about the beginning of February, on a bed of good soil (if the soil is sandy the better), sowed to an inch or more deep, in preference to the south, observing a full furrow to be judicious to the vegetation of the seeds, and he, the seeds, which young. The seeds are best sown in a deep, thick, broad bed, extending from north to south, as is usual with gardeners and nurserymen, and then to keep the ground from being too dry, when the season is dry, and to make a bed for lowering the rhubarb roots, about two feet thick, with new dung from the stable, covering it near one foot thick with good soil. The intent of this bed is not for the sake of warmth, but solely to prevent the rising of earth-worms, which in a moist season, will frequently destroy the young crop. If the seed is good, the plants often rise too thick; if so, when they have attained six leaves they should be taken carefully up (where too close), leaving the standing crop eight or ten inches apart: those taken up may be planted at the same distance, in a fresh spot of ground, in order to furnish other plantations. When the plants in general are grown to the size that cabbage-plants are usually set out for a standing crop, they are best planted where they are to remain, in beds four feet wide, one row along the middle of the bed, leaving two yards distance betwixt the plants,

Rhine  
Rhinegau.

*Lower Circle of the RHINE*, consists of the palatinate of the Rhine, and the three ecclesiastical electorates, viz. those of Cologne, Mentz, and Trier.

*Upper Circle of the RHINE*, consisted of the landgraviates of Alsace and Hesse, comprehending the Wetteraw; but now only Hesse can be accounted a part of Germany, Alsace being long ago united to France.

**RHINBERG**, a town of Germany, in the circle of the Lower Rhine, and diocese of Cologne. It was in the possession of the French, but restored to the archbishop of Cologne by the treaty of Utrecht. It is seated on the Rhine, in E. Long. 6. 39. N. Lat. 51. 30.

**RHINECK**, a town of Germany, in the archbishopric of Cologne, seated on the Rhine, E. Long. 7. 53. N. Lat. 50. 27.—There is another town of the same name in Switzerland, capital of Rinthal, seated on the Rhine, near the lake of Constance, with a good castle. E. Long. 9. 53. N. Lat. 47. 38.

**RHINFELD**, a small but strong town of Germany, in the circle of Suabia, and the best of the four forest-towns belonging to the house of Austria. It has been often taken and retaken in the German wars; and is seated on the Rhine, over which there is a handsome bridge. E. Long. 7. 53. N. Lat. 47. 40.

**RHINEGAU**, a beautiful district of the electorate of Mentz, is situated on the Rhine, about three miles from the city of Mentz, and is so populous that it looks like one entire town intermixed with gardens and vineyards. The Rhine here grows astonishingly wide, and forms a kind of sea, near a mile broad, in which are several well wooded little islands. The Rhinegau forms an amphitheatre, the beauties of which are beyond all description. At Walluf, the very high hills come nearly down to the river side; from thence they recede again into the country, forming a kind of half circle, the other end of which is 15 miles off at Rudesheim, on the banks of the Rhine. The banks of the river, the hills which form the circles, and the slopes of the great mountains, are thick sown with villages and hamlets. The white appearance of the buildings, and the fine blue slated roofs of the houses, playing amidst the various green of the landscape, have an admirable effect. In the space of every mile, as you sail down the river, you meet with a village which in any other place would pass for a town. Many of the villages contain from 300 to 400 families; and there are 36 of them in a space of 15 miles long and six miles broad, which is the width of this beautiful amphitheatre. The declivities of all the hills and mountains are planted thick with vineyards and fruit trees, and the thick wooded tops of the hills cast a gloomy horror over the otherwise cheerful landscape. Every now and then a row of rugged hills runs directly down to the shore, and dominates majestically over the lesser hills under them. On one of these great mountains, just about the middle of the Rhinegau, you meet with *Johannisberg*, a village which produces some of the best Rhine-wine. Before this village is a pretty little rising, and near the banks of the river there is a very fine old castle, which gives unspeakable majesty to the whole landscape. Indeed, in every village, you meet with some or other large building, which contributes very much to the decoration of the whole. This country is indebted for its

riches to this semicircular hill, which protects it from the cold winds of the east and north, at the same time that it leaves room enough for the sun to exercise his benign influences. The groves and higher slopes of the hills make excellent pastures, and produce large quantities of dung, which, in a country of this sort, is of inestimable value.

The bank of the Rhine, opposite to the Rhinegau, is exceedingly barren, and heightens the beauty of the prospect on the other side by the contrast it exhibits; on this side, you hardly meet above three or four villages, and these are far distant from each other. The great interval between them is occupied by heaths and meadows, only here and there a thick bush affords some shade, and a few corn fields among the villages enliven the gloomy landscape. The back ground of this country is the most picturesque part of it. It is formed by a narrow gullet of mountains, which diminish in perspective between Rudesheim and Bingen. Perpendicular mountains and rocks hang over the Rhine in this place, and seem to make it the dominion of eternal night. At a distance, the Rhine seems to come out of this landscape through a hole under ground; and it appears to run tediously, in order to enjoy its course through a pleasant country the longer. Amidst the darkness which covers this back ground, the celebrated *Monsieur* tower seems to swim upon the river. In a word, there is not any thing in this whole tract that does not contribute something to the beauty and magnificence of the whole; or, if I may be permitted the expression, to make the paradise more welcome. As you sail along the Rhine, between Mentz and Bingen, the banks of the river form an oval amphitheatre, which makes one of the richest and most picturesque landscapes to be seen in Europe. The inhabitants of these regions are some of them extremely rich, and some extremely poor. The happy middle state is not for countries the chief product of which is wine; for, besides that the cultivation of the vineyard is infinitely more troublesome and expensive than agriculture, it is subjected to vexations, which in an instant reduce the holder to the condition of a day-labourer. It is a great misfortune for this country, that, though the nobility are, through connivance of the state, allowed to purchase as much land as they please, the peasant generally begins by encumbering himself for his vineyard; so that if it does not turn out well, he is reduced to day labour, and the rich man extends his possessions to the great detriment of the country. There are several peasants here, who having incomes of 30, 50, or 100 guineas a-year, have laid aside the peasant, and assumed the wise-merchant; but, splendid as their situation is, it does not compensate, in the eyes of the humane man, for the sight of so many poor people with which the villages swarm. In order to render a country of this kind prosperous, the state should appropriate a fund to the purpose of maintaining the peasant in bad years, and giving him the assistance which his necessities, and his want of ready money, may from time to time make convenient.

The inhabitants of the Rhinegau are a handsome and uncommonly strong race of men. You see at the very first aspect that their wine gives them merry hearts and sound bodies. They have a great deal of natural wit, and a vivacity and jocoseness, which distinguishes them

Rhinceros

very much from their neighbours. You need only compare them with some of these, to be convinced that the drinker of wine excels the drinker of beer and water, both in body and mind, and that the inhabitant of the south is much stouter than he who lives in the north; for though the wine-drinker may not have quite as much flesh as he who drinks only beer, he has better blood, and can bear much more work. Tacitus had already observed this, in his treatise *De moribus Germanorum*. "The large and corpulent bodies of the Germans (says he) have a great appearance, but are not made to last." At that time almost all the Germans drank only water; but the mere drinking of wine has effected a revolution in several parts of Germany, which makes the present inhabitants of these countries very different from those described by Tacitus. Black and brown hair is much commoner here than the white, which made the Germans so famous in old Rome. "It will be easily imagined (says Baron Riefbeck), that the monks fare particularly well in so rich a country. We made a visit to the prelate of Erbach. These lordly monks, for so in every respect they are, have an excellent hunt, rooms magnificently furnished, billiard tables, half a dozen beautiful singing women, and a stupendous wine cellar, the well ranged batteries of which made me shudder. A monk, who saw my astonishment at the number of the casks, assured me, that, without the benign influence which flowed from them, it would be totally impossible for the cloister to subsist in so damp a situation."

**RHINFELS**, a castle of Germany, in the circle of the Lower Rhine; in a county of the same name. It is looked upon as one of the most important places seated on the Rhine, as well in regard to its strength as situation. It is near St. Gear, and built on a craggy rock. This fortress commands the whole breadth of the Rhine, and those who pass are always obliged to pay a considerable toll. In the time of war it is of great importance to be masters of this place. E. Long. 7. N. Lat. 50. 3.

**RHINLAND**, a name given to a part of South Germany, which lies on both sides the Rhine, and of which Leipsic is the capital town.

**RHINOCEROS**, in zoology, a genus of quadrupeds belonging to the order of belluæ. The name is from the Greek, but these animals were totally unknown to the ancient Greeks. Aristotle takes no notice of them, nor any other Greek writer till Strabo, nor Roman till Pliny. It is probable they did not frequent that part of India into which Alexander had penetrated, since it was near 300 years after that Pompey brought them to Europe. From this time till the days of Heliogabalus, the rhinoceros was frequently exhibited in the Roman spectacles; and he has often been transported into Europe in more modern times; but they were long very ill represented, and very imperfectly described, till some that arrived in London in 1739 and 1741 were inspected, by which the errors and caprices of former writers were detected.

There are two species of rhinoceros, the first of which is the *unicornis*, the length of which, Buffon

tells us, from the extremity of the muzzle to the origin of the tail, is at least 12 feet, and the circumference of the body is nearly the same. "The rhinoceros which came to London in the year 1739 was sent from Bengal. Though not above two years of age, the expence of his food and journey amounted to near 1000l. Sterling. He was fed with rice, sugar, and hay. He had daily seven pounds of rice, mixed with three pounds of sugar, and divided into three portions. He had likewise hay and green herbs, which last he preferred to hay. His drink was water, of which he took large quantities at a time (A). He was of a peaceable disposition, and allowed all parts of his body to be touched. When hungry, or struck by any person, he became mischievous, and in both cases nothing appeased him but food. When enraged, he sprung forward, and nimbly raised himself to a great height, pushing at the same time his head furiously against the walls, which he performed with amazing quickness, notwithstanding his heavy aspect and unwieldy mass. I often observed, says Dr Parsons, these movements produced by rage or impatience, especially in the mornings before his rice and sugar were brought to him. The vivacity and promptitude of his movements, Dr Parsons adds, led me to think, that he is altogether unconquerable, and that he could easily overtake any man who should offend him.

"This rhinoceros, at the age of two years, was not taller than a young cow that has never produced. But his body was very long and very thick. His head was disproportionally large. From the ears to the horn there is a concavity, the two extremities of which, namely the upper end of the muzzle, and the part near the ears, are considerably raised. The horn, which was not yet above an inch high, was black, smooth at the top, but full of wrinkles directed backward at the base. The nostrils are situated very low, being not above an inch distant from the opening of the mouth. The under lip is pretty similar to that of the ox; but the upper lip has a greater resemblance to that of the horse, with this advantageous difference, that the rhinoceros can lengthen this lip, move it from side to side, roll it about a staff, and seize with it any object he wishes to carry to his mouth. The tongue of this young rhinoceros was soft, like that of a calf. His eyes had no vivacity: In figure they resembled those of the hog, and were situated lower, or nearer the nostrils, than in any other quadruped. His ears are large, thin at the extremities, and contracted at their origin by a kind of annular rugosity. The neck is very short, and surrounded with two large folds of skin. The shoulders are very thick, and at their juncture there is another fold of skin, which descends upon the fore legs. The body of this young rhinoceros was very thick, and pretty much resembled that of a cow about to bring forth. Between the body and crupper there is another fold, which descends upon the hind legs. Lastly, Another fold transversely surrounds the inferior part of the crupper, at some distance from the tail. The belly was large, and hung near the ground, particularly its middle part. The legs are round, thick, strong, and

D d 2

their

(A) "Their food in a state of nature is the grossest herbs, as thistles and thorny shrubs, which they prefer to the soft pasture of the best meadows; they are fond of the sugar cane, and eat all kinds of grain, but for flesh they have no appetite."

Rhinoceros

Hist. ry,  
Vol. VI. p.  
92, &c.

**Rhinoceros.** their joint bended backwards. This joint, which, when the animal lies, is covered with a remarkable fold of the skin, appears when he stands. The tail is thin, and proportionally short; that of the rhinoceros so often mentioned, exceeded not 16 or 17 inches in length. It turns a little thicker at the extremity, which is garnished with some short, thick, hard hairs. The form of the penis is very extraordinary. It is contained in a prepuce or sheath like that of the horse; and the first thing that appears in the time of erection is a second prepuce, of a flesh-colour, from which there issues a hollow tube, in the form of a funnel cut and bordered somewhat like a flower-de-luce, and constitutes the glans and extremity of the penis. This anomalous glans is of a paler flesh-colour than the second prepuce. In the most vigorous erection, the penis extends not above eight inches out of the body; and it is easily procured by rubbing the animal with a handful of straw when he lies at his ease. The direction of this organ is not straight, but bended backward. Hence he throws out his urine behind; and from this circumstance, it may be inferred that the male covers not the female, but that they unite with their cruppers to each other. The female organs are situated like those of the cow; and she exactly resembles the male in figure and grossness of body. The skin is so thick and impenetrable, that when a man lays hold of any of the folds, he would imagine he is touching a wooden plank of half an inch thick (a); When tanned, Dr Grew remarks, it is excessively hard, and thicker than the hide of any other terrestrial animal. It is everywhere covered more or less with incrustations in the form of galls or tuberosities, which are pretty small on the top of the neck and back, but become larger on the sides. The largest are on the shoulders and crupper, are still pretty large on the thighs and legs, upon which they are spread all round, and even on the feet. But between the folds the skin is penetrable, delicate, and as soft to the touch as silk, while the external part of the fold is equally hard with the rest. This tender skin between the folds is of a light flesh-colour; and the skin of the belly is nearly of the same colour and consistence. These galls or tuberosities should not be compared, as some authors have done, to scales. They are only simple indurations of the skin, without any regularity in their figure or symmetry in their respective positions. The flexibility of the skin in the folds enables the rhinoceros to move with facility his head, neck, and members. The whole body, except at the joints, is inflexible, and resembles a coat of mail. Dr Parsons remarks, that this animal listened with a deep and long continued attention to any kind of noise; and that, though he was sleeping, eating, or obeying any other, pressing demands of nature, he raised his head, and listened till the noise ceased."

These animals never assemble or march together in troops like elephants. Being of a more solitary and savage disposition, they are more difficult to hunt and to overcome. They never attack men, however, except when they are provoked, when they are very furious and formidable; but as they see only before them, and

not very sharply, and as they turn with great difficulty, Rhinoceros they may be easily avoided. The skin of these animals is so extremely hard as to resist sabres, lances, javelins, and even musket balls, the only penetrable parts being the belly, the eyes, and about the ears. Hence the hunters generally attack them when they lie down to sleep.— Their flesh is considered as excellent by the Indians and Africans, but especially by the Hottentots; and if they were trained when young, they might be rendered domestic, in which case they would multiply more easily than the elephant. They inhabit Bengal, Siam, Cochinchina, Quangsi in China, the isles of Java and Sumatra, Congo, Angola, Ethiopia, and the country as low as the Cape. They love shady forests, the neighbourhood of rivers, and marshy places. They wallow in the mire like hogs, and are said by that means to give shelter in the folds of their skins to scorpions, centipedes, and other insects. This is denied by Buffon and Edwards, though the surgeon of the Shaftesbury had observed in a rhinoceros, newly taken after having weltered in the mud, several insects concealed under the ply of the skin. This carries with it every appearance of probability; for as the creature welters in mud, it is impossible for it to do so without bringing up with it some of the insects which live in that mud; and when this is the case, it surely cannot be unnatural to suppose that they would shelter themselves under the plaits of the skin. Mr Bruce had an opportunity of examining the skin of a rhinoceros before his muddy covering had been scraped off, and saw under it several very large worms, but not of the carnivorous kind. He saw likewise several smaller animals resembling earwigs, which he took to be young scolopendras; and, though he searched no farther, we must certainly consider this as a proof of what the surgeon of the Shaftesbury related. Mr Bruce supposes, too, that they welter in mire, partly in order to screen themselves by a coat of mud from the attacks of that mischievous fly which infests the animals of Abyssinia to such a degree. The time of the fly (says he) being in the rainy season, the whole black earth turns into mire. In the night, when the fly is at rest, the rhinoceros chooses a convenient place, and there, rolling himself in the mud, he clothes himself with a kind of case, which defends him against his enemy the following day. The wrinkles and parts of his skin serve to keep this muddy plaster fast upon him, all but about his hips, shoulders, and legs, where it cracks and falls off by motion, and leaves him exposed in those places to the attacks of the fly. The itching and pain which follow occasion him to rub himself in those parts against the roughest trees; and this is at least one cause of the pustules or tubercles which we see upon these places, both on the elephant and rhinoceros. They bring forth only one young at a time, about which they are very solicitous. They are said to consort with tygers; a story founded merely on their common attachment to the sides of rivers, by which means they are often found near each other. Their skin, flesh, hoofs, teeth, and even dung, are used in India medicinally. The horn, especially that of a virgin rhinoceros, is considered as an antidote against poison. Every horn,

(a) This Mr Bruce denies to be the case, and suspects, where it does occur, that it is the effect of disease, or of a different habit acquired by keeping. In their natural state, he thinks they prevent this rigidity by wallowing in the mud.

Rhinoceros horn, however, has not this property; some of them selling very cheap, while others are extremely dear.

Some writers are of opinion, that the rhinoceros is the unicorn of holy writ and of the ancients, and that the oryx or Indian ass of Aristotle, who says it has but one horn, was the same, his informers comparing the clumsy shape of the rhinoceros to that of the ass.—It was also the *bos unicornis* and *fera monoceros* of Pliny, both of which were of India; and in his account of the monoceros he exactly describes the great black horn and hog-like tail. The unicorn of Scripture is considered as having all the properties of the rhinoceros, as rage, untameableness, great swiftness, and vast strength. This opinion is most ably supported by Mr Bruce. “The derivation of the Hebrew word *reem* (says he), which in our version is translated *unicorn*, both in the Hebrew and the Ethiopic, seems to be from erectness, or standing straight. This is certainly no particular quality in the animal itself, who is not more or even so much erect as many other quadrupeds, for in its knees it is rather crooked; but it is from the circumstance and manner in which its horn is placed. The horns of all other animals are inclined to some degree of parallelism with his nose or os frontis. The horn of the rhinoceros is erect and perpendicular to this bone, on which it stands at right angles, thereby possessing a greater purchase or power, as a lever, than a horn could possibly have in any other position. The situation of the horn is very happily alluded to in Scripture; ‘My horn shalt thou exalt like the horn of an unicorn.’ And the horn here alluded to is not wholly figurative, but was really an ornament worn by great men in the days of victory, preferment, or rejoicing, when they were anointed with *seu*, sweet, or fresh oil; a circumstance which David joins with that of erecting the horn.

Some authors, for what reason I know not, have made the *reem*, or unicorn, to be of the deer or antelope kind; that is, of a genus whose very character is weakness, directly opposite to the qualities by which the *reem* is described in Scripture: besides, it is evident that the *reem* is not of the class of clean quadrupeds, and a late modern traveller very whimsically takes him for the Leviathan, which certainly was a fish. Balaam, a prophet of Midian, and so in the neighbourhood of the haunts of the rhinoceros, and intimately connected with Ethiopia, (for they themselves were shepherds of that country), in a transport, from contemplating the strength of Israel, whom he was brought to curse, says, they had, as it were, the strength of the *reem*. Job makes frequent allusion to his great strength, ferocity, and rudocility. He asks, ‘Will the *reem* be willing to serve thee, or abide by thy crib?’ that is, Will he willingly come into thy stable, and eat at thy manger? And again, ‘Canst thou bind the *reem* with a band in the furrow; and will he harrow the valleys for thee?’—In other words, Canst thou make him go to the plough or harrows?

“The rhinoceros, in Geez, is called *Arwe Harich*, and in the Amharic *Auraris*; both which names signify ‘the large wild beast with the horn.’ This would seem as if applied to the species with one horn. On the other hand, in the country of the Shangalla and in Nubia he

is called *Girnamgirn*, or ‘horn upon horn;’ and this would seem to denote that he had two. The Ethiopic text renders the word *reem*; ‘*Arwe-Harich*,’ and this the Septuagint translation *monoceros*, or *unicorn*. The principal reason of translating the word *unicorn* rather than *rhinoceros*, is from a prejudice that he must have had but one horn. But this is by no means so well founded as to be admitted the only argument for establishing the existence of an animal, which never has appeared after the search of so many ages. Scripture speaks of the horns of the unicorn; so that even from this circumstance the *reem* may be the rhinoceros, as the Asiatic, and part of the African rhinoceros, may be the unicorn.”

The rhinoceros *bicornis* was long known in Europe merely by the double horns which were preserved in various cabinets; and its existence, though now past all doubt, has been frequently questioned. Dr Sparman, in his voyage to the Cape of Good Hope, killed two of these animals, which he dissected, and very minutely describes. The horns, he says, in the live animal are so mobile and loose, that when it walks carelessly along, one may see them waggle about, and hear them clash and clatter against each other. In the Phil. Trans. for 1793, we have a description of the double-horned rhinoceros of Sumatra, by Mr Bell, surgeon in the service of the East India Company at Bencoolen; and this account, though it differs considerably from that of Sparman in some particulars, we shall insert here. “The animal (says Mr Bell) herein described was shot with a leaden ball from a musket about ten miles from Fort Marlborough. I saw it the day after; it was then not in the least putrid, and I put it into the position from which the accompanying drawing was made. (See Plate cccxxxviii.) It was a male; the height at the shoulder was 4 feet 4 inches; at the sacrum nearly the same; from the tip of the nose to the end of the tail eight feet five inches.—From the appearance of its teeth and bones it was but young, and probably not near its full size. The shape of the animal was much like that of the hog. The general colour was a brownish ash; under the belly, between the legs and folds of the skin, a dirty flesh colour. The head much resembled that of the single-horned rhinoceros; the eyes were small, of a brown colour; the *membrana nictitans* thick and strong; the skin surrounding the eyes was wrinkled; the nostrils were wide; the upper lip was pointed, and hanging over the under.

“There were six *molars*, or grinders, on each side of the upper and lower jaw, becoming gradually larger backward, particularly in the upper; two teeth in the front of each jaw; the tongue was quite smooth; the ears were small and pointed, lined and edged with short black hair, and situated like those of the single-horned rhinoceros. The horns were black, the larger was placed immediately above the nose, pointing upwards, and was bent a little back; it was about nine inches long. The small horn was four inches long, of a pyramidal shape, flattened a little, and placed above the eyes, rather a little more forward, standing in a line with the larger horn, immediately above it. They were both firmly attached to the skull, nor was there any appearance of joint or muscles to move them (c). The neck was thick and short, the skin on the under side thrown in-

to

(c) Mr Bruce, however, says, that in the living animal the horns are extremely sensible. He informs us, that:

Rhinoceros to folds, and these folds again wrinkled. The body was bulky and round, and from the shoulder ran a line, or fold, as in the single-horned rhinoceros, though it was but faintly marked. There were several other folds and wrinkles on the body and legs; and the whole gave rather the appearance of softness: the legs were thick, short, and remarkably strong; the feet armed with three distinct hoofs, of a blackish colour, which surrounded half the foot, one in front, the others on each side.—The soles of the feet were convex, of a light colour, and the cuticle on them not thicker than that on the foot of a man who is used to walking; the cuticles hardly appeared externally; the penis was bent backward, and opened about 18 inches below the anus. At its origin it was as thick as a man's leg, and about two feet and a half long; the bend in it occasions the urine to be discharged backwards. The glans is very singular; the opening of the urethra is like the mouth of a cup with its brim bending over a little, and is about three quarters of an inch in diameter; the glans here is about half an inch in diameter, and continues that thickness for an inch and a half: it is then inserted into another cup like the first, but three times as large; the glans afterwards gradually becomes thicker, and at about nine inches from the opening of the urethra are placed two bodies on the upper part of the glans, very like the nipples of a milk cow, and as large; these become turgid when the penis is erected: the whole of this is contained in the prepuce, and may be considered as glans. From the os pubis arises a strong muscle, which soon becomes tendinous: this tendon is continued along the back or upper part of the penis; it is flattened, is about the size of a man's little finger, and is inserted into the upper part of the glans, near the end. The use of this muscle is to straiten the penis. On the under side of the penis there are two muscles, antagonists to the above; they arise from the os ischium fleshy, run along the lower side of the penis, on each side of the corpus spongiosum, and are inserted fleshy in the lower side of the glans; the action of these muscles will draw in the penis, and bend it. The male has two nipples, like the female, situated between the hind legs; they are about half an inch in length, of a pyramidal form, rounded at the end.

"The whole skin of the animal is rough, and covered very thinly with short black hair. The skin was not more than one third of an inch in thickness at the strongest part; under the belly it was hardly a quarter of an inch; any part of it might be cut through with ease by a common dissecting knife. The animal had not that appearance of armour which is observed in the single-horned rhinoceros. Since I dissected the male, I have had an opportunity of examining a female, which was more of a lead colour: it was younger than the male, and had not so many folds or wrinkles in its skin; of course it had still less the appearance of armour. The only external mark which distinguishes it from the male is the vagina, which is close to the anus; whereas in the male the opening for the penis is 18 inches below the anus."

From the difference between this account and Spar-

man's, which in some particulars is considerable, and Rhinoceros from the difference of shape, we are disposed to think them varieties. Mr Bruce's drawing of the rhinoceros bicornis is unquestionably a deception; the body of the animal, as there represented, corresponds exactly with that of the unicornis except in its having two horns on its head. In the museum of the late Dr William Hunter, the two-horned animal was preserved, agreeing exactly with the general accounts and figures we have of that animal, but differing essentially from Mr Bruce's. For further particulars respecting these curious animals, we refer to Buffon, Vol. VI. p. 92—117; Sparman's Voyage to the Cape, Vol. II. Chap. 12.; Bruce's Travels, Vol. IV. p. 296, &c. and Appendix, p. 85, &c.

RHITYMNA, See RETIMO.

RHIZOBALUS, in botany: A genus of the tetragynia order, belonging to the polvandria class of plants; and in the natural method ranking under the 23d order, *Tribilata*. The calyx monophyllous, fleshy, and downy; the corolla consists of five petals, which are round, concave, fleshy, and much larger than the calyx; the stamina are very numerous, filiform, and longer than the corolla; the styli are four, filiform, and of the length of the stamina; the pericarpium has four drupæ, kidney-shaped, compressed with a fleshy substance inside, and in the middle a flat large nut containing a kidney-shaped kernel. Of this there is only one species, viz. *Pekia*. The nuts are sold in the shops as American nuts; they are flat, tuberculated, and kidney-shaped, containing a kernel of the same shape, which is sweet and agreeable. Clusius gives a good figure of the nut, and Aublet has one of the whole plant.

RHIZOPHORA, the MANGROVE, or *Mangle*, in botany: A genus of the monogynia order, belonging to the dodecandria class of plants; and in the natural method ranking under the 12th order, *Haloraceæ*. The calyx is quadripartite, the corolla partite; there is one seed, very long, and carnosous at the base. These plants are natives of the East and West Indies, and often grow 40 or 50 feet high. They grow only in water and on the banks of rivers, where the tide flows up twice a day. They preserve the verdure of their leaves throughout the year. From the lowest branches these long roots which hang down to the water, and penetrate into the earth. In this position they resemble the roots of an arched tree, from five to ten feet high, which serve to support the body of the tree, and even to ascend into the air into the bed of the water. These arcades are so closely intertwined with another, that they form a kind of natural and permanent terrace, raised with such solidity over the water, that one might walk upon them, were it not that the branches are too much encumbered with leaves. The most natural way of propagating these trees, is to suffer the several slender small filaments which issue from the main branches to take root in the earth. The most common method, however, is that of laying the small lower branches in baskets of mould or earth till they have taken root.

The description just given pertains chiefly to a particular species of mangrove, termed by the West Indians

Rhizo-  
phora.

that once at a hunting match he saw the point of a rhinoceros's horn broken off by a musket-shot; the consequence of which was, that the creature was for a moment deprived of all appearance of life.

dians *black mangles*, on account of the brown dusky colour of the wood. The bark is very brown, smooth, pliant when green, and generally used in the West India islands for tanning of leather. Below this bark lies a cuticle, or skin, which is lighter, thinner, and more tender. The wood is nearly of the same colour as the bark; hard, pliant, and very heavy. It is frequently used for fuel, for which purpose it is said to be remarkably proper: the fires which are made of this wood being both clearer, more ardent and durable than those made of any other materials whatever. The wood is compact; almost incorruptible; never splinters; is easily worked; and were it not for its enormous weight, would be commodiously employed in almost all kinds of work, as it possesses every property of good timber. To the roots and branches of mangroves that are immersed in the water, oysters frequently attach themselves; so that wherever this curious plant is found growing on the sea shore, oyster-fishing is very easy; as in such cases these shell-fish may be literally said to be gathered upon trees.

The red mangle or mangrove grows on the sea shore, and at the mouths of large rivers; but does not advance, like the former, into the water. It generally rises to the height of 20 or 30 feet, with crooked knotty branches, which proceed from all parts of the trunk. The bark is slender, of a brown colour, and, when young, is smooth, and adheres very closely to the wood; but when old, appears quite cracked, and is easily detached from it. Under this bark is a skin as thick as parchment, red, and adhering closely to the wood, from which it cannot be detached till the tree is felled and dry. The wood is hard, compact, heavy, of a deep red, with a very fine grain. The pith or heart of the wood being cut into small pieces, and boiled in water, imparts a very beautiful red to the liquor, which communicates the same colour to wool and linen. The great weight and hardness of the wood, prevents it from being generally used. From the fruit of this tree, which, when ripe, is of a violet colour, and resembles some grapes in taste, is prepared an agreeable liquor, much esteemed by the inhabitants of the Caribbean islands.

White mangle, so termed from the colour of its wood, grows, like the two former, upon the banks of rivers, but is seldom found near the sea. The bark is gray; the wood, as we have said, is white, and when green, supple; but dries as soon as cut down, and becomes very light and brittle. This species is generally called *rope-mangrove*, from the use to which the bark is applied by the inhabitants of the West Indies. This bark, which, by reason of the great abundance of sap, is easily detached when green from the wood, is beaten or bruised betwixt two stones, until the hard and woody part is totally separated from that which is soft and tender. This last, which is the true cortical substance, is twisted into ropes of all sizes, which are exceedingly strong, and not apt to rot in the water.

RHODES, a celebrated island in the Archipelago, the largest and most easterly of the Cyclades, was known in ancient times by the names of *Asteria*, *Ophiussa*, *Æthiæa*, *Trinacria*, *Corymbia*, *Pœssa*, *Ata'yrina*, *Marcia*, *Oloessa*, *Stadia*, *Telchinis*, *Pelagia*, and *Rhodus*. In later ages, the name of *Rhodus*, or *Rhodes*, prevailed, from the Greek word *rhodon*, as is commonly sup-

posed, signifying a "rose;" the island abounding very much with these flowers. Others, however, give different etymologies, among which it is difficult to find one preferable to another. It is about 20 miles distant from the coasts of Lycia and Caria, and about 120 miles in compass.

Several ancient authors assert, that Rhodes was formerly covered by the sea, but gradually raised its head above the waves, and became an island. Delos and Rhodes (says Pliny), islands which have long been celebrated, sprung at first from the sea. The same fact is supported by such a variety of other evidence as render it indubitable. Philo† ascribes the event to the decrease of the waters of the ocean. If his conjecture be not without foundation, most of the isles of the Archipelago, being lower than Rhodes, must have had a similar origin. But it is much more probable that the volcanic fires, which in the fourth year of the 135th Olympiad, raised Therasia and Thera, known at present by the name of *Santorin*, from the depths of the sea, and have in our days thrown out several small islands adjacent, also produced in some ancient era Rhodes and Delos.

The first inhabitants of Rhodes, according to Diodorus Siculus, were called the *Telchine*, who came originally from the island of Crete. These, by their skill in astrology, perceiving that the island was soon to be drowned with water, left their habitations, and made room for the Heliades, or grandsons of Phœbus, who took possession of the island after that god had cleared it from the water and mud with which it was overwhelmed. These Heliades, it seems, excelled all other men in learning, and especially in astrology; invented navigation, &c. In after ages, however, being infested with great serpents which bred in the island, they had recourse to an oracle in Delos, which advised them to admit Phorbas, a Thessalian, with his followers, into Rhodes. This was accordingly done; and Phorbas having destroyed the serpents, was after his death honoured as a demigod. Afterwards a colony of Cretans settled in some part of the island, and a little before the Trojan war, Tlepolemus the son of Hercules, who was made king of the whole island, and governed with great justice and moderation.

After the Trojan war, all the ancient inhabitants were driven out by the Dorians, who continued to be masters of the island for many ages. The government was at first monarchical; but a little before the expedition of Xerxes into Greece, a republican form of government was introduced; during which the Rhodians applied themselves to navigation, and became very powerful by sea, planting several colonies in distant countries. In the time of the Peloponnesian war, the republic of Rhodes was rent into two factions, one of which favoured the Athenians, and another the Spartans; but at length the latter prevailing, democracy was abolished, and an aristocracy introduced. About 351 B. C. we find the Rhodians oppressed by Mausolus king of Caria, and at last reduced by Artemisia his widow. In this emergency, they applied to the Athenians; by whose assistance, probably, they regained their liberty.

From this time to that of Alexander the Great, the Rhodians enjoyed an uninterrupted tranquillity. To him they voluntarily submitted; and were on that account

3 First inhabitants.

4 driven out by the Dorians.

5 Submit to Alexander. To but revolt after his death.

Rhodes. count highly favoured by him : but no sooner did they hear of his death, than they drove out the Macedonian garrisons, and once more became a free people. About this time happened a dreadful inundation at Rhodes; which, being accompanied with violent storms of rain, and hailstones of an extraordinary bigness, blew down many houses, and killed great numbers of the inhabitants. As the city was built in the form of the amphitheatre, and no care had been taken to clear the pipes and conduits which conveyed the water into the sea, the lower parts of the city were in an instant laid under water, several houses quite covered, and the inhabitants drowned before they could get to the higher places. As the deluge increased, and the waters continued, some of the inhabitants made to their ships, and abandoned the place, while others miserably perished in the waters. But while the city was thus threatened with utter destruction, the wall on a sudden burst asunder, and the water discharging itself by a violent current into the sea, unexpectedly delivered the inhabitants from all danger.

6  
Violent inundation at Rhodes.

The Rhodians suffered greatly by this unexpected accident, but soon retrieved their losses by a close application to trade. During the wars which took place among the successors of Alexander, the Rhodians observed a strict neutrality; by which means they enriched themselves so much, that Rhodes became one of the most opulent states of that age; inasmuch that, for the common good of Greece, they undertook the *pirate war*, and, at their own charge, cleared the seas of the pirates who had for many years infested the coasts of Europe and Asia. However, notwithstanding the neutrality they professed, as the most advantageous branches of their commerce were derived from Egypt, they were more attached to Ptolemy, king of that country, than to any of the neighbouring princes. When therefore Antigonus, having engaged in a war with Ptolemy about the island of Cyprus, demanded succours of them, they earnestly entreated him not to compel them to declare war against their ancient friend and ally. But this answer, prudent as it was, drew upon them the displeasure of Antigonus, who immediately ordered one of his admirals to sail with his fleet to Rhodes, and seize all the ships that came out of the harbour for Egypt. The Rhodians, finding their harbour blocked up by the fleet of Antigonus, equipped a good number of galleys, fell upon the enemy, and obliged him, with the loss of many ships, to quit his station. Hereupon Antigonus, charging them as aggressors, and beginners of an unjust war, threatened to besiege their city with the strength of his whole army. The Rhodians endeavoured by frequent embassies to appease his wrath; but all their remonstrances served rather to provoke than allay his resentment: and the only terms upon which he would hearken to any accommodation were, that the Rhodians should declare war against Ptolemy, that they should admit his fleet into their harbour, and that a hundred of the chief citizens should be delivered up to him as hostages for the performance of these articles. The Rhodians sent ambassadors to all their allies, and to Ptolemy in particular, imploring their assistance, and representing to the latter, that their attachment to his interest had drawn upon them the danger to which they were exposed. The preparations on both sides were immense. As Antigonus was near fourscore years of

7  
Difference with Antigonus

age at that time, he committed the whole management of the war to his son Demetrius, who appeared before the city of Rhodes with 300 ships of war, 170 transports having on board 40,000 men, and 1000 other vessels laden with provisions and all sorts of warlike engines. As Rhodes had enjoyed for many years a profound tranquillity, and been free from all devastations, the expectation of booty, in the plunder of so wealthy a city, allured multitudes of pirates and mercenaries to join Demetrius in this expedition; inasmuch that the whole sea between the continent and the island was covered with ships; which struck the Rhodians, who had a prospect of this mighty armada from the walls, with great terror and consternation.

Demetrius, having landed his troops without the reach of the enemy's machines, detached several small bodies to lay waste the country round the city, and cut down the trees and groves, employing the timber and materials of the houses without the walls, to fortify his camp with strong ramparts and a triple palisade; which works, as many hands were employed, were finished in a few days. The Rhodians, on their part, prepared for a vigorous defence. Many great commanders, who had signalized themselves on other occasions, threw themselves into the city, being desirous to try their skill in military affairs against Demetrius, who was reputed one of the most experienced captains in the conduct of sieges that antiquity had produced. The besieged began with dismissing from the city all such persons as were useless; and then taking an account of those who were capable of bearing arms, they found that the citizens amounted to 6000, and the foreigners to 3000. Liberty was promised to all the foreigners should distinguish themselves by any glorious action, and the public engaged to pay the market price for ransom. A proclamation was likewise made, that whoever died in defence of their country should be buried at the expence of the public; that the parents and children should be maintained out of the public; that fortunes should be given to his daughters, and his sons, when they were grown up, should be crowned and presented with a complete suit of armour at the solemnity of Bacchus; which decrees kindled an indomitable ardour in all ranks of men.

Rhodes.  
8  
Rhodes besieged by Demetrius.

9  
The inhabitants prepare a vigorous defence.

Demetrius, having planted all his engines, began to batter with incredible fury the walls of the city, and the harbour; but was for eight days incessantly repulsed by the besieged, who set fire to most of his warlike engines, and thereby obliged him to allow them some respite, which they made good use of in repairing the breaches, and building new walls where the old ones were either weak or low. When Demetrius had repaired his engines, he ordered a general assault to be made, and caused his troops to advance with loud shouts, thinking by this means to strike terror into the enemy. But the besieged were so far from being intimidated, that they repulsed the aggressors with great slaughter, and performed the most astonishing feats of bravery. Demetrius returned to the assault next day; but was in the same manner forced to retire, after having lost a great number of men, and some officers of distinction. He had seized, at his first landing, an eminence at a small distance from the city; and, having fortified this advantageous post, he caused several batteries to be erected there, with engines, which incessantly discharged against

10  
Engines of Demetrius.

**Rhodes.** against the wall stones of 150 pounds weight. The towers, being thus furiously battered night and day, began to totter, and several breaches were opened in the walls: but the Rhodians, unexpectedly sallying out, drove the enemy from their post, overturned their machines, and made a most dreadful havoc; inasmuch that some of them retired on board their vessels, and were with much ado prevailed upon to come ashore again.

11  
Several desperate assaults without success.

Demetrius now ordered a scalade by sea and land at the same time; and so employed the besieged, that they were at a loss what place they should chiefly defend. The attack was carried on with the utmost fury on all sides, and the besieged defended themselves with the greatest intrepidity. Such of the enemy as advanced first were thrown down from the ladders, and miserably bruised. Several of the chief officers, having mounted the walls to encourage the soldiers by their example, were there either killed or taken prisoners. After the combat had lasted many hours, with great slaughter on both sides, Demetrius, notwithstanding all his valour, thought it necessary to retire, in order to repair his engines, and give his men some days rest.

Demetrius being sensible that he could not reduce the city till he was master of the port, after having refreshed his men, he returned with new vigour against the fortifications which defended the entry into the harbour. When he came within the cast of a dart, he cast a vast quantity of burning torches and firebrands, to be thrown into the Rhodian ships, which were riding close; and at the same time galled, with dreadful showers of darts, arrows, and stones, such as offered themselves to the flames. However, in spite of their utmost efforts, the Rhodians put a stop to the fire; and, having with great expedition manned three of their strongest ships, drove with such violence against the vessels in which the enemy's machines were planted, that they were shattered in pieces, and the engines were thrown into the sea. Excited by this success, Demetrius attacked the enemy's fleet with his three ships, and sunk many vessels; but was himself at last taken, and the other two vessels made their escape; and Demetrius retired.

As this last attack had proved to Demetrius, he was obliged to undertake another; and, in order to succeed in his attempt, he ordered a machine of a new invention to be built, which was thicker than the height and breadth of those he had hitherto used. When the work was finished, he ordered the engine to be placed near the port, which he was resolved, at all adventures, to force. But as it was upon the point of entering the harbour, a dreadful storm arising, drove it against the shore, with the vessels on which it had been reared. The besieged, who were attentive to improve all favourable conjunctures, while the tempest was still raging, made a sally against those who defended the eminence mentioned above; and, though repulsed several times, carried it at last, obliging the Demetrians, to the number of 400, to throw down their arms and submit. After this victory gained by the Rhodians, there arrived to their aid 150 Gnoſſians, and 500 men sent by Ptolemy from Egypt, most

of them being natives of Rhodes, who had served among the king's troops.

Demetrius being extremely mortified to see all his batteries against the harbour rendered ineffectual, resolved to employ them by land, in hopes of carrying the city by assault, or at least reducing it to the necessity of capitulating. With this view, having got together a vast quantity of timber and other materials, he framed the famous engine called *helepolis*, which was by many degrees larger than any that had ever been invented before. Its basis was square, each side being in length near 90 cubits, and made up of square pieces of timber, bound together with plates of iron. In the middle part he placed thick planks, about a cubit distant from each other; and on these the men were to stand, who forced the engine forward. The whole was moved upon eight strong and large wheels, whose sides were strengthened with strong iron plates. In order to facilitate and vary the movements of the *helepolis*, casks were placed under it, whereby it was turned in an instant to what side the workmen and engineers pleased. From each of the four angles a large pillar of wood was carried to about the height of 100 cubits, and inclining to each other; the whole machine consisting of nine stories, whose dimensions gradually lessened in the ascent. The first story was supported by 43 beams, and the last by no more than nine. Three sides of the machine were plated over with iron, to prevent its being damaged by the fire that might be thrown from the city. In the front of each story were windows of the same size and shape as the engines that were to be discharged from thence. To each window were shutters, to draw up for the defence of those who managed the machines; and to deaden the force of the stones thrown by the enemy, the shutters being covered with skins stuffed with wool. Every story was furnished with two large staircases, that whatever was necessary might be brought up by one, while others were going down by the other, and in every thing might be despatched without tumult or confusion. This huge machine was moved forwards by 3000 of the strongest men of the whole army; but the art with which it was built greatly facilitated the motion. Demetrius caused likewise to be made several tentacles or pent-houses, to cover his men while they advanced to fill up the trenches and ditches; and invented a new sort of galleries, through which those who were employed at the siege might pass and repass at their pleasure, without the least danger. He employed all his seamen in levelling the ground over which the machines were to be brought up, to the space of four furlongs. The number of workmen who were employed on this occasion amounted to 30,000.

In the mean time, the Rhodians, observing these formidable preparations, were busy in raising a new wall within that which the enemy intended to batter with the *helepolis*. In order to accomplish this work, they pulled down the wall which surrounded the theatre, some neighbouring houses, and even some temples, after having solemnly promised to build more magnificent structures in honour of the gods, if the city were preserved. At the same time, they sent out nine of their best ships to seize such of the enemy's vessels as they could meet with, and thereby distress them for

12  
Demetrius frames a new machine called *helepolis*.

13  
The Rhodians raise a new wall.

Rhodes. want of provisions. As these ships were commanded by their bravest sea-officers, they soon returned with an immense booty, and a great many prisoners. Among other vessels, they took a galley richly laden, on board of which they found a great variety of valuable furniture, and a royal robe, which Phila herself had wrought and sent as a present to her husband Demetrius, accompanied with a letter, written with her own hand. The Rhodians sent the furniture, the royal robe, and even the letter, to Ptolemy, which exasperated Demetrius to a great degree.

While Demetrius was preparing to attack the city, the Rhodians having assembled the people, and consulted to consult about the measures that should be taken, some proposed in the assembly the pulling down of the statues of Antigonus and his son Demetrius, which till then had been held in the utmost veneration. But this proposal was generally rejected, with indignation, and their prudent conduct greatly raised the wrath both of Antigonus and Demetrius.

However, the latter continued to carry on the siege with the utmost vigour, thinking it would reflect no small dishonour on him were he obliged to quit the place without making himself master of it. He caused the walls to be secretly undermined: but, when they were ready to fall, a deserter very opportunely gave notice of the whole to the townsmen; who having, with all expedition, drawn a deep trench all along the wall, began to countermine, and, meeting the enemy under ground, obliged them to abandon the work. While both parties guarded the mines, one Athenagoras a Milesian, who had been sent to the assistance of the Rhodians by Ptolemy with a body of mercenaries, promised to betray the city to the Demetrians, and let them in thro' the mines in the night time. But this was only in order to ensnare them; for Alexander, a noble Macedonian, whom Demetrius had sent with a choice body of troops to take possession of a post agreed on, no sooner appeared, but he was taken prisoner by the Rhodians, who were waiting for him under arms. Athenagoras was crowned by the senate with a crown of gold, and presented with five talents of silver.

Demetrius now gave over all thoughts of undermining the walls, and placed all his hopes of reducing the city in the battering engines which he had contrived. Having therefore levelled the ground under the walls, he brought up his helepolis, with four seduces on each side of it. Two other seduces of an extraordinary size, bearing battering rams, were likewise moved forwards by 1000 men. Each arm of the helepolis was filled with all sorts of engines for discharging of stones, arrows, and darts. When all things were ready, Demetrius ordered the signal to be given; when his men, setting up a shout, assaulted the city on all sides both by sea and land. But, in the heat of the attack, when the walls were ready to fall by the repeated strokes of the battering rams, ambassadors arrived from Cnidos, earnestly soliciting Demetrius to suspend all further hostilities, and at the same time giving him hopes that they should prevail upon the Rhodians to submit to an honourable capitulation. A suspension of arms was accordingly agreed on, and ambassadors sent from both sides. But the Rhodians refusing to capitulate on the conditions offered them, the attack was renewed with so much fury,

and the machines, played off in so brisk a manner, Rhodes. that a large tower, built with square stones, and the wall that flanked it, were battered down. The besieged, nevertheless, fought in the breach with so much courage and resolution, that the enemy, after various unsuccessful attempts, were forced to abandon the enterprise, and retire.

In this conjuncture, a fleet which Ptolemy had The be-  
freighted with 300,000 measures of corn, and differ- sieged re-  
ent kinds of pulse, for the use of the Rhodians, ar- ceive a large  
rived very seasonably in the port, notwithstanding the supply of  
vigilance of the enemy's ships, which cruised on the provisions,  
coasts of the island to surprise them. A few days and set the  
after came in, safe, two other fleets, one sent by Cas- engines on  
sander, with 100,000 bushels of barley; the other fire.  
by Lysimachus, with 400,000 bushels of corn, and as  
many of barley. This seasonable and plentiful supply  
arriving, when the city began to suffer for want of  
provisions, inspired the besieged with new courage,  
and raised their drooping spirits. Being thus animated,  
they formed a design of setting the enemy's engines on  
fire, and with this view ordered a body of men to fall  
on the night ensuing, about the second watch, with  
torches and firebrands, having first placed on the walls  
an incredible number of engines, to discharge stones,  
arrows, darts, and fire-balls, against those who should  
attempt to approach their detachment. The Rhodian  
troops, pursuant to their orders, all on a sudden issued  
out, and advancing, in spite of all opposition, to the  
towers, set them on fire, while the engines from the walls  
played incessantly on those who endeavoured to extinguish  
the flames. The Demetrians on this occasion fell  
in great numbers, being incapable, in the darkness of  
the night, either to see the engines that continually  
charged showers of stones and arrows upon them, or to  
join in one body and repulse the enemy. The con-  
fusion was so great, that several platoons of men  
from the helepolis, that vast engine which was  
entirely consumed, had not the troops that were  
mentioned in it with all possible speed quitted  
with water, before prepared, and ready in the  
mouths of the engine against such accidents.  
Thus, seeing lest all his machines should be  
called together, by sound of trumpet, that he might  
vince it was to move them; and, by that noise, to  
them off before they were entirely demolished. It  
was day, he commanded all the darts and arrows  
that had been sent by the Rhodians to be carried  
ed, that he might from their number form some judg-  
ment of the number of machines in the city. A few  
fire-brands were found on the spot, and no fewer  
than 1000 darts, all discharged in a very small portion  
of the night. This struck the prince himself with no  
small terror, for he never imagined that they would  
have been able to bear the charges of such formidable  
preparations. However, after having caused the slain  
to be buried, and given directions for the curing of  
the wounded, he applied himself to the repairing of  
his machines, which had been dismounted and rendered  
quite unserviceable.

In the mean time, the besieged, improving the respite They build  
allowed them by the removal of the machines, built a third wall.  
third wall in the form of a crescent, which took in all  
that part that was most exposed to the enemies bat-  
teries; and, besides, drew a deep trench behind the  
breach,

Rhodes. breach, to prevent the enemy from entering the city that way. At the same time, they detached a squadron of their best ships, under the command of Anytus, who made over to the continent of Asia; and there meeting with some privateers who were commissioned by Demetrius, took both the ships and the men, among whom were Timocles the chief of the pirates, and several other officers of distinction belonging to the fleet of Demetrius. On their return, they fell in with several vessels laden with corn for the enemy's camp, which they likewise took, and brought into the port. These were soon followed by a numerous fleet of small vessels loaded with corn and provisions sent them by Ptolemy, together with 1500 men, commanded by Antiponus a Macedonian of great experience in military affairs. Demetrius, in the mean time, having repaired his machines, brought them up anew to the walls, which he incessantly battered till he opened a great breach and threw down several towers. But when he came to the assault, the Rhodians, under the command of Antimachus, defended themselves with such resolution and intrepidity, that he was in three successive attacks repulsed with great slaughter, and at last forced to retire. The Rhodians likewise on this occasion, lost several officers and soldiers; others, the brave Antimachus their commander.

18  
Demetrius makes a breach in the walls, but is still repulsed.

While the Rhodians were thus signalling their fidelity to the defence of their country, a second embassy arrived at the camp of Demetrius from Athens, and the other cities of Greece, soliciting Demetrius to raise their matters, and strike up a peace with the Rhodians. At the request of the ambassadors, who were in all haste, a relation of arms was agreed upon; but the peace offered by Demetrius being anew rejected by the Rhodians, the ambassadors returned home without success. To bring the contending parties to an agreement, the Rhodians were therefore renewed; and Demetrius, whose imagination was fertile in expedients for success in his projects, formed a detachment of his best troops, under the conduct of Akimachus, and two officers of great resolution and experience, sending them to enter the breach at midnight, forcing the intrenchment behind it, to post themselves about the theatre, where it was difficult matter to maintain themselves against the townsmen. In order to facilitate the entrance of so important and dangerous a detachment, the enemy with false intelligence, upon a signal given, ordered the rest of the army to set up a shout, and attack the city on all sides both by sea and land. By this stratagem he hoped that, the besieged being alarmed in all quarters, his detachments might find an opportunity of forcing the intrenchments which covered the breach, and afterwards of seizing the advantageous post about the theatre. This feint had all the success the prince could expect; for the troops having set up a shout from all quarters, as if they were advancing to a general assault, the detachment commanded by Akimachus and Mancius entered the breach, and fell upon those who defended the ditch, and the wall that covered it, with such vigour, that, having slain the most part of them and put the rest in confusion, they advanced to the theatre, and seized on the post adjoining to it. This occasioned a general uproar in the city, as if it had been

His troops enter the breach;

already taken; but the commanding officers despatched orders to the soldiers on the ramparts not to quit their posts, nor stir from their respective stations. Having thus secured the walls, they put themselves at the head of a chosen body of their own troops, and of those who were lately come from Egypt, and with these charged the enemy's detachment. But the darkness of the night prevented them from dislodging the enemy and regaining the advantageous post they had seized. Day, however, no longer appeared, then they renewed their attack with wonderful bravery. The Demetrians withstood the assault with good stead, and endeavoured to animate the Rhodians to maintain their ground till they were relieved by their own troops. The Rhodians being sensible of the importance of their liberties, and all that was dear to them, lay at stake, fought like men in the breach, and the enemy defending their posts for several hours without giving ground in the least. At length the Rhodians, encouraging each other to exert themselves in defence of their country, and animated by the example of their leaders, made a last effort, and, breaking into the very heart of the enemy's battalion, but are all killed or taken.

Demetrius, not at all discouraged by this check, was making the necessary preparations for a new assault, when he received letters from his father Antigonus, enjoining him to conclude a peace with the Rhodians upon the best terms he could get, lest he should lose his whole army in the siege of a single town. From this time Demetrius wanted only some plausible pretence for breaking up the siege. The Rhodians likewise were now more inclined to come to an agreement than formerly; Ptolemy having acquainted them that he intended to send a great quantity of corn, and 3000 men to their assistance, but that he would first have them try whether they could make up matters with Demetrius upon reasonable terms. At the same time ambassadors arrived from the Aetolian republic, soliciting the contending parties to put an end to a war which might involve all the east in endless calamities.

An accident which happened to Demetrius in this conjuncture, did not a little contribute towards the conclusion of a peace. This prince was preparing to advance his siege against the city, when a Rhodian engineer found means to render it quite useless. He undermined the tract of ground over which the helepolis was to pass the next day in order to approach the walls. Demetrius not suspecting any stratagem of this nature, caused the engine to be moved forward, which coming to the place that was undermined, sunk so deep into the ground that it was impossible to draw it out again. This misfortune, if we believe Vegetius and Vitruvius, determined Demetrius to hearken to the Aetolian ambassadors, and at last to strike up a peace upon the following conditions: That the republic of Rhodes should be maintained in the full enjoyment of their ancient rights, privileges and liberties, without any foreign garrison; that they should renew their ancient alliance

Rhodes.

20  
but are all killed or taken.

21  
the helepolis rendered useless.

Rhodes with Antigonus, and with him in his wars against all states and princes except Ptolemy king of Egypt; and that, for the effectual performance of the articles stipulated between them, they should deliver 100 hostages, such as Demetrius should make choice of, except those who bore any public employment.

Thus was the league raised, after it had continued a whole year: and the Rhodians amply rewarded all those who had distinguished themselves for the service of their country. They also let up statues to Alexander, Cassander, and Lyfimachus; to all of whom they paid the highest honours, especially to Demetrius, whom they worshipped as a god. Demetrius rewarded them with the heliopolis, and all the machines which he had employed in the siege of Rhodes, from the sale of which, with some treasure which they had of their own, they erected the famous temple of Apollo; and they applied themselves entirely to the improvement of navigation; by which means they became quite masters of the sea, and much more opulent than any of the neighbouring nations. As far as lay in their power they endeavoured to preserve a neutrality with regard to the jarring nations of the east. However, they could not avoid a war with the Byzantines, the occasion of which was as follows: The Byzantines being obliged to pay a yearly tribute of 80 talents to the Gauls, in order to raise this sum, they came to a resolution of laying a tax on all ships that traded to the Pontic sea. This resolution provoked the Rhodians, who were a trading nation, above all the rest. For this reason they immediately despatched ambassadors to the Byzantines, complaining of the new tax; but as the Byzantines had no other method of satisfying the Gauls, they persisted in their resolution. The Rhodians now declared war, and prevailed upon Prusias king of Bithynia, and Attalus king of Pergamus, to assist them; by which confederacy the Byzantines were so intimidated, that they agreed to exact no toll from ships trading to the Pontic sea, the demand of which had been the occasion of the war.

23  
far with  
the Byzantines.  
24  
dreadful  
earthquake  
at Rhodes.  
About this time happened a dreadful earthquake, which threw down the colossus, the arsenal, and great part of the city-walls of Rhodes; which calamity the Rhodians improved to their advantage, sending ambassadors to all the Grecian princes and states, to whom their losses were so much exaggerated, that their countrymen obtained immense sums of money under pretence of repairing them. Hiero king of Syracuse presented them with 100 talents; and, besides, exempted them from all tolls and duties such as traded to Rhodes. Ptolemy king of Egypt gave them 100 talents, a million of measures of wheat, materials for building 20 quinqueremes, and the like number of triremes; and, besides, gave them 100 architects, 300 workmen, and materials for repairing their public buildings, to a great value, paying them, moreover 14 talents a-year for the maintenance of the workmen whom he sent them. Antigonus gave them 100 talents of silver, with 10,000 pieces of timber, each piece being 16 cubits long; 7000 planks; 3000 pounds of iron, as many of pitch and resin, and 1000 measures of tar. Chryseus, a woman of distinction, sent them 100,000 measures of wheat, and 3000 pounds of lead. Antiochus exempted from all taxes and duties the Rhodian ships trading to his dominions; presented them with 10 galleys, and 200,000

R H O  
measures of corn, with many other things of great value. Prusias, Mithridates, and all the princes then reigning in Asia, made them proportionable presents; in short, all the Greek towns and nations, all the princes of Europe and Asia, contributed, according to their ability, to the relief of the Rhodians on that occasion; insomuch that their city not only soon rose from its ruins, but attained to a higher pitch of splendour than ever.

25  
In the year 203 B. C. the Rhodians engaged in a war with Philip of Macedon. This monarch had invaded the territories of Attalus king of Pergamus; and because the Rhodians seemed to favour their ancient friend, sent one Hieracides, by birth a Tarentine, to set on fire their fleet; at the same time that he despatched ambassadors into Crete, in order to stir up the Cretans against the Rhodians, and prevent them from sending any assistance to Attalus. Upon this war was immediately proclaimed. Philip at first gained an inconceivable advantage in a naval engagement; but the next year he was defeated with the loss of 11,000 men, while the Rhodians lost but 60 men and Attalus 70. After this he carefully avoided coming to an engagement at sea either with Attalus or the Rhodians. The combined fleet, in the mean time, sailed towards the island of Rhodes in hopes of intercepting him; but having failed in their purpose, they sailed to Attalus, where they concluded a treaty with that people; and on their return, drew all the Cyclades into a confederacy against Philip. But while the allies were thus wasting their time in negotiations, Philip, having divided his forces into two bodies, sent one, under the command of Philocles, to ravage the Athenian territories, and put the other aboard his fleet, with orders to sail to Meropea, a city on the north side of Rhodes. The Athenians marched towards that city himself, and his forces, took it by assault, and reduced a great number of others; so that the confederates would, in probability, have had little reason to boast of their success, had not the Romans come to their assistance, by which the war was soon terminated to their advantage. In the year which took place between the Romans and Antigonus the Great king of Syria, the Rhodians were very useful allies to the former. The Rhodian fleet was indeed destroyed by a stratagem of the contrivance of Polyxenes the Syrian admiral; but they soon fitted out another, and defeated a fleet of theirs, commanded by the celebrated Hannibal, and the Roman commander; after which, in conjunction with the Romans, they utterly defeated the whole Syrian fleet, commanded by Polyxenes; which together with the loss of the battle of Magnesia, so dispirited Antigonus, that he submitted to whatever conditions the Romans stated.

For these services the Rhodians were rewarded with the provinces of Lycia and Caria; but tyrannising over the people in a terrible manner, the Lycians applied to the Romans for protection. This was readily granted; but the Rhodians were so much displeased with their interfering in this matter, that they secretly favoured Perseus in the war which broke out between him and the Roman republic. For this offence the two provinces above-mentioned were taken from them; but the Rhodians, having banished or put to death those who had favoured Perseus, were again admitted into favour,

vous, and greatly honoured by the senate. In the Mithridatic war, their alliance with Rome brought upon them the king of Pontus with all his force; but having lost the greatest part of his fleet before the city, he was obliged to raise the siege without performing any remarkable exploit. In the war which Pompey made on the Cilician pirates, the Rhodians assisted him with all their naval force, and had a great share in the victories which he gained. In the civil war between Caesar and Pompey, they assisted the latter with a very numerous fleet. After his death they sided with Caesar, which drew upon them the resentment of C. Cassius, who advanced to the island of Rhodes with a powerful fleet, after having reduced the greatest part of the continent. The Rhodians, terrified at his approach, sent ambassadors entreating him to make up matters in an amicable manner, and promising to stand neuter, and send their ships which they had lent to the assistance of Pompey. Cassius insisted upon their delivering up their fleet to him, and putting him in possession both of their harbour and city. This the Rhodians would by no means comply with, and therefore began to fortify themselves in a condition to stand a siege; but Lucius Archelaus, who had taught Cassius the Greek tongue while he studied at Rhodes, to intercede with his officers in their behalf. Archelaus could do with all his authority, prevail upon him to moderate his demands; whereupon the Rhodians, having created one Alexander, a bold and enterprising man, their pretor or prytanis, equipped a fleet of 35 sail, and sent it out under the command of Menelaus, an experienced sea officer, to oppose Cassius's fleet. Both fleets fought with incredible fury, and the victory was long doubtful; but the Rhodians, being at length overpowered by numbers, were obliged to raise the siege, and to return to Rhodes; two of their ships being sunk, and the rest very much damaged by the heavy ships of the Romans. This was the first time, as our author observes, that the Rhodians were ever engaged in a sea fight.

18  
The Rhodians de-  
fended by  
sea and  
land, and  
were  
at last  
taken by  
Cassius

When he beheld this fight from a neighbouring hill, he was so much affected, that he refused his fleet, which had been so long engaged, and returned to the continent, leaving the Rhodians in possession of their stronghold, on the continent belonging to the island. This castle he took by assault, and from thence he sent his land forces, under the conduct of Brutus, over into the island. His fleet consisted of 100 ships of war and above 200 transports. Brutus, when he saw this mighty fleet appear, was so much terrified, that he refused to meet the enemy. He fled, and was so much pursued, that he was obliged to land on the coast of the island, and great numbers of men were killed on both sides. The Rhodians were so much distressed by the Romans; who immediately blockaded the city, and cut off Rhodes both by sea and land. As the Rhodians had not had time to furnish the city with sufficient store of provisions, some of the inhabitants, fearing that if it were taken either by assault or by famine, Cassius would put all the inhabitants to the sword, as Brutus had lately done at Xanthus, privately opened the gate to him, and put him in possession of the town, which he nevertheless treated as if it had been taken by assault. He commanded 50 of the chief citizens, who were suspected to favour the adverse party, to be brought before him, and sentenced them all to die; others, to the number of 25, who had commanded the fleet or any

plagues the  
city.

because they did not appear when summoned, he proscribed. Having thus punished such as had either acted or spoken against him or his party, he commanded the Rhodians to deliver up to him all their ships, and whatever money they had in the public treasury. He then plundered the temples, stripping them of all their valuable furniture, vessels, and statues. He is said not to have left one stone in the whole city, except that of the temple of Apollo, at his departure, that he had stripped the Rhodians of all they had, leaving them nothing but a few private persons, he commanded the Rhodians to bring him all the treasures which they had, promising, by a public edict, that he would discover any hidden treasures. The Rhodians at first concealed some part of their treasures, but finding that Cassius intended by this to terrify them; but when they saw that he was earnest, and saw several wealthy citizens dig in search for concealing only a small portion of their treasures, they desired that the time prefixed for the delivery of their gold and silver might be prolonged. Cassius willingly granted them their request; and thus, through fear they dug up what they had hid under ground, and laid at his feet all they were worth in the world. By this means he extorted from private persons above 8000 talents. He then fined the city 1000 more; and leaving L. Varus there with a strong garrison to exact the fine without any abatement, he returned to the continent.

Rhodes

After the death of Cassius, Marc Antony restored the Rhodians to their ancient rights and privileges; bestowing upon them the islands of Andros, Naxos, Tenos, and the city of Myndus. But these the Rhodians so oppressed and loaded with taxes, that the same Antony, though a great friend to the Rhodian republic, was obliged to divest her of the sovereignty over those places, which he had a little before so liberally bestowed upon her. From this time to the reign of the emperor Claudius we find no mention made of the Rhodians. That prince, as Dion informs us, deprived them of their liberty for having crucified some Roman citizens. However, he soon restored them to their former condition, as we read in Suetonius and Tacitus. The latter adds, that they had been as often deprived of, as restored to, their liberty, by way of punishment or reward for their different behaviour; as they had obliged the Romans, with their assistance in foreign wars, or provoked them with their seditions at home. Pliny, who wrote in the beginning of Vespasian's reign, styles Rhodes a beautiful and free town. But this liberty they did not long enjoy, the island being soon after reduced Roman by the same Vespasian to a Roman province, and obliged to pay a yearly tribute to their new masters. This province was called the province of the islands. The Roman pretor who governed it resided at Rhodes, as the chief city under his jurisdiction; and Rome, notwithstanding the eminent services rendered her by this republic, thenceforth treated the Rhodians not as allies, but as vassals.

10  
Rhodes re-  
duced to a  
Roman  
province by  
Vespasian.

The island of Rhodes continued subject to the Romans till the reign of the emperor Andronicus; when Villaret, grand master of the knights of Jerusalem, then residing in Cyprus, finding himself much exposed to the attacks of the Saracens in that island, resolved to exchange it for that of Rhodes. This island too was almost

against  
Rhodes.

Rhodes.

almost entirely occupied by the Saracens; and the eastern emperor possessing little more in it than a castle. Nevertheless he refused to grant the investiture of the island to Villaret. The latter, without spending time in fruitless negotiations, sailed directly for Rhodes, where he landed his troops, provisions, and warlike stores, in spite of the opposition made by the Saracens, who then united against the common enemy. As Villaret foresaw that the capital must be taken before he could reduce the island, he immediately set upon which the grand-master thought proper to turn the siege into a blockade; but he found himself so closely surrounded by the Greeks and other Christians, that he could get no supply either of provisions or for his army. But having at length obtained a supply of provisions by means of large immunities from the Florentines, he came out of his trenches, and attacked the Saracens, with a full resolution either to conquer or die. A bloody fight ensued, in which a great number of the bravest knights were killed; but at length the Saracens gave way, and fled to their ships; upon which the city was immediately assaulted and taken. The Greeks and other Christians had their lives and estates given them, but the Saracens were all cut to pieces. The reduction of the capital was followed by that of all the other places of inferior strength throughout the island; and in four years after their landing, the whole was subjugated, and the conquerors took the title of the *Knights of Rhodes*. For many years those knights continued the terror of the Saracens and Turks, and sustained a severe siege from Mohammed II. who was compelled to abandon the enterprise; but at length the Turkish sultan Solyman resolved at all events to drive them from it. Before he undertook the expedition, he sent a message commanding them to depart the island without delay: in which case he promised that neither they nor the inhabitants should suffer any injury, but threatened them with his utmost vengeance if they refused his offer. The knights, however, proving obstinate, Solyman attacked the city with a fleet of 400 sail and an army of 140,000 men.

33  
The city  
besieged by  
Solyman.

The trenches were soon brought close to the counter-scarp, and a strong battery raised against the town; which, however, did but little damage, till the sultan being informed by a spy of this particular, and that he was in danger of receiving some fatal shot from the tower of St John which overlooked his camp, he planted a battery against that tower, and quickly brought it down. Solyman, however, finding the whole place in some measure covered with strong fortifications of such height as to command all his batteries, ordered an immense quantity of stones and earth to be brought, which so great a number of hands were employed night and day by turns, that they quickly raised a couple of hillocks high enough to overtop the city-walls. They plied them accordingly with such a continual fire, that the grand-master was obliged to cause them to be strongly propped within with earth and timber. All this while the besieged, who, from the top of the grand-master's palace, could discover how their batteries were planted, demolished them with their cannon almost as fast as they raised them.

Here the enemy thought proper to alter their measures, and to plant a strong battery against the tower of

St Nicholas, which, in the former siege by Mohammed, had resisted all the efforts of the then grand-vizier. This the bashaw of Romania caused to be battered with 12 large pieces of brass cannon, but had the mortification to see them all dismounted by those of the tower; to prevent which in future, he ordered them to be fired only in the night, and in the day had them covered with gabions and earth. This had such success, that, after 500 cannon-shot, the wall began to shake and tumble into the ditch; but he was surprised to find another wall behind it, well terraced, and bordered with artillery, and himself obliged either to begin afresh or give up the enterprise: and yet this last was what Solyman preferred, when he was told of its being built on a hard rock, incapable of being sapped, and how firmly it had held out against all the efforts of Mohammed's vizier. The next attack was therefore ordered by him to be made against the bastions of the town, and that with a vast number of the largest artillery, which continued firing during a whole month; so that the new wall of the bastion of England was quite demolished, though the old one stood proof against all their shot. That of Italy, which was battered by 17 large pieces of cannon, was still worse damaged; upon which Martinengo the engineer advised the grand-master to cause a sally to be made on the trenches of the enemy, that of the breach, whilst he was making fresh intrenchments behind it. His advice succeeded; and the 260 men that sallied out sword in hand having surprised the Turks in the trench, cut most of them in pieces. At the same time a new detachment, which was sent to repulse them, being obliged, as that engineer rightly judged, to pass by a spot which lay open to their artillery, were likewise mostly destroyed by the continual fire that came from it, whilst the soldiers were employed in filling up several fathoms of the trench before they retired. By that time the breach had been repaired with such new works, that all the efforts to mount it by assault proved equally ineffectual and destructive.

Unfortunately for the besieged, the continual fire which they had made caused such a consumption of their powder, that they began to feel the want of it; and the vizier, Sidour Amaral, whose province it had been to supply the magazines of it, having amused the grand-master with a false report, that there was more than sufficient to maintain the siege, though it should last a whole year or more. But here the grand-master found it necessary to supply in some measure that unexpected defect, by the cautious provision he had made of a large quantity of sulphur, which was immediately ground and made into gunpowder, though he was at the same time obliged to order the engineers to be more sparing of it for the future, and to make use of it only in the defence of such breaches as the enemy should make.

All this while the Turks had not gained an inch of Desperate ground; and the breaches they had made were so suddenly either repaired or defended by new intrenchments, in mines, &c. that the very rubbish of them must be mounted by assault. Solyman, therefore, thought it now advisable to set his numerous pioneers at work, in five different parts, in digging of mines, each of which led to the bastion opposite to it. Some of these were countermined by a new invented method of Martinengo; who, by the help of braced skins, or drums, could discover where

Rhodes.  
34  
Terribly  
battered.

**Rhodes** where the miners were at work. Some of these he perceived, which he caused to be opened, and the miners to be driven out by hand grenades; others to be smothered, or burned, by setting fire to gunpowder. Yet did not this hinder two considerable ones to be sprung, which did a vast deal of damage to the bastion of England, by throwing down about six fathoms of the wall, and filling up the ditch with its rubbish: whereupon the Turks immediately climbed up sword in hand to the top of it, and planted seven of their standards upon the parapet; but being stopped by a traverse, the knights, recovering from their surprise, fell upon them with such fury, that they were obliged to abandon it with great loss. The grand-master, who was then at church, quickly came to the place with his short pike in his hand, attended by his knights, encouraging all he met with, burghers, soldiers, and others, to fight bravely in defence of their religion and country, and arrived time enough to assist in the taking down their standards, and driving down the enemy by the way they came up. In this did the vizier Mustapha endeavour to prevent their flight by killing some of the foremost with his sword, and driving the rest back; they were obliged to abandon the bastion, and, when they fell worse, met with that death in their flight, which they had strove to shun, from the fire-arms which were discharged upon them from the ramparts. Three hundred lost their lives in this attack, besides some thousands of the Turks; the grand-master, on his side, lost some of his bravest knights, particularly his standard-bearer.

The attacks were almost daily renewed with the same ill success and loss of men, every general striving to distinguish himself in the sight of their emperor. At length the old general Perissus Pyrrus, having dismissed the troops which guarded the bastion of Italy for several days, without intermission, caused a strong detachment, which he had kept concealed behind a cannon, to mount the place by break of day, on the 24th of September; where, finding them overcome with fatigue, they cut the throats of the sentinels, and, passing through the breach, were just going to fall upon them. The Italians, however, quickly recovered themselves and their arms, and gave them an obstinate repulse. The contest was fierce and bloody on both sides, and the bashaw, still supplying his own men with reinforcements, would hardly have failed of overcoming the other, had not the grand-master, when the alarm had quickly reached, timely intervened, and, by his presence, as well as example, revived his Rhodians, and thrown a sudden panic among the enemy. Pyrrus, desirous to do something to wipe off the disgrace of this repulse, tried his fortune next in an adjoining work, lately raised by the grand-master Caretto; but here his soldiers met with a still worse treatment, being almost overwhelmed with the hand-grenades, melted pitch, and boiling oil, which came pouring upon them, whilst the forces which were on the adjacent flanks made as great a slaughter of those that fled; in so much that the janissaries began to resume their old murmuring tone, and cry out that they were brought thither only to be slaughtered.

The grand vizier Mustapha, afraid lest their complaints should reach his master, agreed at length, as the last resort, to make a fresh attempt on the bastion

of England, whilst, to cause a diversion, the bashaw Ahmed sprung some fresh mines at an opposite part of the city. This was accordingly executed on the 17th of September; when the former, at the head of five battalions, resolutely mounted or rather crept up the breach, and, in spite of the fire of the English, advanced so far as to pitch some standards on the top; when, on a sudden, a crowd of English knights, commanded by one Bork, or Burk, sallied out of their intrenchments, and, assisted by some other officers of distinction, obliged them to retire, though in good order. Mustapha, provoked at it, led them back, and killed Bork with his own hand; and had his men behaved as they ought, the place must have been recovered; but the fire which was made from the different muskets and musketry disconcerted them to such a degree, that neither threats nor entreaties could prevent their abandoning the enterprise, and dragging them away with them by main force. The Rhodians, in that action several brave knights, both English and German; and, in particular, John Burk, their valiant commander: but the Turks lost above 3000 men, besides many officers of distinction. Much the same ill success having attended Ahmed with his mines, one of which had been opened, and the other only bringing some fathoms of the wall down, he was also obliged to retreat; his troops, though some of the very best, being forced to disperse themselves, after having borne the fire and fury of the Spanish and Auvergnian knights as long as they were able.

By this time Solymann, affrased and exasperated at his ill success, called a general council; in which he made some stinging reflections on his vizier, for having represented the reduction of Rhodes as a very easy enterprise. To avoid the effects of the sultan's resentment, the subtle Mustapha declared, that hitherto they had fought the enemy as it were upon equal terms, as if they had been afraid of taking an ungenerous advantage of their superiority, by which, said he, we have given them an opportunity of opposing us with their united force wherever we attacked them. But let us now resolve upon a general assault on several sides of the town; and see what a poor defence their strength, thus divided, will be able to make against our united force. The advice was immediately approved by all, and the time appointed for the execution of it was on the 24th of that month, and every thing was ordered to be got ready against that day. Accordingly the town was actually assaulted at four different parts, after having suffered a continual fire for some time from their artillery in order to widen their breaches; by which the grand-master easily understood their design, and that the bastions of England and Spain, the post of Provence, and terrace of Italy, were pitched upon for the assault, and took his precautions accordingly.

The morning was no sooner come, than each party mounted their respective breach with an undaunted bravery, the young sultan, to animate them the more, having ordered his throne to be reared on an eminence, whence he could see all that was done. The Rhodians, on the other hand, were no less diligent in repulsing them with their cannon and other fire-arms, with their melted lead, boiling oil, stink-pots, and other usual expedients. The one side ascended the scaling ladders, fearless of all that opposed them; the other overturn

once.

Rhodes. their ladders and send them tumbling down headlong into the ditches, where they were overwhelmed with stones, or despatched with darts and other missile weapons. The bastion of England proves the scene of the greatest slaughter and bloodshed; and the grand-master makes that his post of honour, and, by his presence and example, inspires his men with fresh vigour and bravery, whilst the continual thunder of the artillery makes such horrid work among the assailants as kills all their courage, and forces them to give way; the lieutenant-general, who commands the Rhodians, leads them back with fresh vigour, and mounts the breach at the head of all; immediately after a cannon-ball from the Spanish bastion, which overtook him dead into the ditch. This disaster, instead of being a dread, fills them with a furious desire of revenge; his death: but all their obstinacy cannot make the Rhodians go one step back, whilst the Rhodians, young men and old, and even women of every rank and age, assist them with an uncommon ardour and firmness; some in overwhelming the enemy with stones; others in destroying them with melted lead, sulphur, and other combustibles; and a third sort in supplying the combatants with bread, wine, and other refreshments.

The assault was no less desperate and bloody on the bastion of Spain, where the knights, who guarded it, not expecting to be so soon attacked, and assumed to stand idle, were assisting the bastion of Italy; which gave the Turks an opportunity to mount the breach, and penetrate as far as their intrenchments, where they planted no less than 30 of their standards on them. The grand-master was quickly apprised of it, and ordered the bastion of Auvergne to play against them; which was done with such diligence, and such continual fire, whilst the Rhodians enter the bastion by the help of their casements, and, sword in hand, fall upon them with equal fury, that the Turks, alike beset by the fire of the artillery and the arms of the Rhodian knights, were forced to abandon the place with a considerable loss. The aga with great bravery rallies them afresh, and brings them back, by which time the grand-master likewise appeared. The fight was renewed with greater fierceness; and such slaughter was made on both sides, that the grand-master was obliged to draw 200 men out of St Nicholas tower to his assistance: these were commanded by some Roman knights, who led them on with such speed and bravery, that their very appearance on the bastion made the janissaries draw back; which Solyman observing from his eminence, caused a retreat to be sounded, to conceal the disgrace of their flight. In these attacks there fell about 3,000 of his best troops, besides several officers of distinction. The loss of the besieged was no less considerable, if we judge from the small number of their forces; but the greatest of all to them was that of some of their bravest and most distinguished knights and commanders, many of whom were killed, and scarce any escaped un wounded. But the most dreadful fate of all had like to have fallen on the favourite vizier Mustapha, who had proposed this general assault; the ill success of which had so enraged the proud sultan, that he condemned him to be shot with arrows at the head of his army; which dreadful sentence was just ready to be executed, when the old bashaw, by his entreaties, obtained a suspension

of it, in hopes that, when his fury was abated, he should also obtain his pardon.

Solyman, however, was so discouraged by his ill successes, that he was on the point of raising the siege, and would have actually done so, had he not been diverted from it by the advice which he received from an Albanian deserter, some say by a letter from the traitor d'Amarald, that the far greater part of the knights were either killed or wounded, and those that remained altogether incapable of sustaining a fresh assault. This having determined him to try his fortune once more, the command of his forces was turned over to the bashaw Achmed; and, to show that he designed not to stir till he was master of the place, he ordered a house to be built on the adjacent mount Philemo for his winter quarters. Achmed marched directly against the bastions of Spain, which had suffered the most; where, before he could open the trenches, his men fell thick and thickened by the constant fire both of small and great guns from the bastion of Auvergne. He lost all a much greater number in raising a rampart of earth to cover the attacks, and give him an opportunity of sapping the wall; and, as soon as he saw a large piece fall, ordered his men to mount the breach. They were no sooner come to the top, than they found a new work and intrenchments which Martinengo had reared; and there they were welcomed with such a brisk fire from the artillery, that they were glad to recover their trenches with the utmost precipitation, after having lost the much greater part of their men. The attack was renewed, and a reciprocal fire continued with great obstinacy, till a master shot deprived that indefatigable engineer of the use of his eyes, and the master of his audacious services for some time. The grand-master, having ordered him to be carried to his palace, took his place, and kept it till he was quite cured, which was not till 14 days after; and continued in the time in the intrenchments with his handful of troops, scarcely allowing himself rest night or day, and ready to expose himself to the greatest dangers, with an ardour more becoming a junior officer than a veteran sovereign; which made his knights look upon their own lives than their paucity and present circumstances could well admit of.

Soon after this, the treason of D'Amarald was discovered, and he was condemned to death and executed; but by this time the city was reduced to the last extremity. The pope, emperor, and other Christian heads, had been long and often importuned by the grand-master for speedy assistance, without success; and, as an addition to all the other misfortunes, those succours which were sent to him from France and England perished at sea. The new supply which he had sent for of provisions from Candia had the same ill fate; so that the winds, seas, and every thing, seemed combined to bring on the destruction of that city and order. The only resource which could be thought of, under so dismal a situation, was, to send for the few remaining knights and forces which were left to guard the other islands, to come to the defence of their capital, in hopes that, if they could save this, the others might in time be recovered, in case the Turks should seize upon them. On the other hand, Solyman, grown impatient at the small ground his general had gained, gave him express orders to renew the attack with all imaginable speed

**Rhodes.** and vigour, before the succours which he apprehended were coming from Europe, obliged him to raise the siege. Achmed instantly obeyed, raised a battery of 17 large cannon against the bastion of Italy, and quickly after made himself master of it, obliging the garrison to retire farther into the city. Here the grand-master was forced to demolish two of the churches, to prevent the enemy's seizing on them; and, with their materials, caused some new works and intrenchments to be made to hinder their proceeding farther.

The Turks, however, gained ground every day, though they still lost vast numbers of their men: at length the 30th of November came, when the grand-master, and both the besiegers and besieged, thought the last assault was to be given. The bashaw Pyrrus, who commanded it, led his men directly to the intrenchments; upon which the bells of all the churches sounded the alarm. The grand-master, and his few knights, troops, and citizens, ran in crowds, and in a confused disorderly manner, to the intrenchments, each fighting in his own way, or rather as his fear directed him. This attack would have proved one of the most desperate that had yet been felt, had not a most vehement storm of cannon, which carried away all the earth upon which the enemy had seemed to serve them as a rampart against the artillery of the bastion of Auvergne; so that being now quite exposed to their continual fire, they fell in such great numbers, that the bashaw could no longer make them stand their ground, but all precipitately fled towards their camp. This last assault threw the grand-master into such a fury, that none of his officers dared to come near him; and the shame of his having now been beaten, while months with such a numerous army before the place, and having lost such myriads of his brave troops with so little advantage, had made him quite desperate, and they all decided the grand-master of his resentment.

At length, having given it time to cool, he began to approach him, and propose a new project to him. He approved, could hardly fail of success; and he proposed to offer the town a generous capitulation; but he observed, that in case the stubborn knights should refuse, he was now reduced to so small a number, or well as their forces and fortifications almost destroyed, the citizens, who were most of them Greeks, and less desirous of glory than solicitous for their own preservation, would undoubtedly accept of any composition that should secure to them their lives and effects.

The grand-master being belied by the sultan, letters were immediately dispersed about the city in his name, exhorting them to submit to his government, and threatening them at the same time with the most dreadful effects of his resentment if they persisted in their obstinacy. Pyrrus likewise despatched a Genoese to approach as near as he could to the bastion of Auvergne, and to entreat the knights to take pity of so many of their Christian brethren, and not expose them to the dreadful effects which must follow their refusal of a capitulation, so generously offered them at their last extremity. Other agents were likewise employed in other places: to all of whom the grand-master ordered some of his men to return this answer, That his order never treated with infidels but with sword in hand. An Albanian was next sent with a letter from the sultan to him, who met with the same repulse;

VOL. XVI. Part I.

**Rhodes.** after which, he ordered his men to fire upon any that should present themselves upon the same pretence; which was actually done. But this did not prevent the Rhodians from listening to the terms offered by the Turks, and holding frequent cabals upon that subject; in which the general massacre of a town taken by assault, the dreadful slavery of those that escaped, the rape of their wives and daughters, the destruction of their churches, the profanation of their holy relics and sacred vessels, and other dire consequences of an unsuccessful war, being duly weighed against the substantial offers, quickly determined them which part to take. The grand-master, however, proving inexorable to their entreaties, they applied to their Greek metropolitans, who readily went and represented all these things to him in the most pathetic terms: Yet he met with no better reception; but was told, that he and his knights were determined to be buried under the ruins of the city if their swords could no longer defend it, and he hoped their example would not permit them to show less courage on that occasion. This answer produced a quite contrary effect; and, as the citizens thought delays dangerous at such a juncture, they came in a body to him by the very next morning, and plainly told him, that if he paid no greater regard to their preservation, they would not fail of taking the most proper measures to preserve the lives and chastity of their wives and children.

This resolution could not but greatly alarm the grand-master; who thereupon called a council of all the knights, and informed them himself of the condition of the place. These all agreed, particularly the engineer Martinengo, that it was no longer defensible, and no other resource left but to accept the sultan's offers; adding, at the same time, that though they were all ready, according to the obligations of their order, to fight to the last drop of their blood, yet it was no less their duty to provide for the safety of the inhabitants who, not being bound by the same obligations, ought not to be made a sacrifice to their glory. It was therefore agreed, with the grand-master's consent, to accept of the next offers the sultan should make. He did not let them wait long: for the fear he was in of a fresh succour from Europe, the intrepidity of the knights, and the shame of being forced to raise the siege, prevailed upon him to hang out his pacific flag, which was quickly answered by another on the Rhodian side; upon which the Turks, coming out of their trenches, delivered up the sultan's letter for the grand-master, to the grand-prior of St Giles, and the engineer Martinengo. The terms offered in it by Solyman appeared so advantageous, that they immediately exchanged hostages; and the knights that were sent to him had the honour to be introduced to him, and to hear them confirmed by his own mouth, though not without threats of putting all to fire and sword in case of refusal, or even delay. Two ambassadors were forthwith sent to him, to demand a truce of three days to settle the capitulation and interests of the inhabitants, who were part Greeks and part Latins; but this was absolutely refused by the impatient monarch, out of a suspicion of the rumoured succour being near, and that the truce was only to gain time till it was come.

He therefore ordered the hostilities to be renewed

F f

with

Rhodes.

with fresh fury; in which the Rhodians made a most noble defence, considering their small number, and that they had now only the barbarian or false bribe of the bastion of Spain left to defend themselves, and once more repulsed the enemy: at which the sultan was so enraged, that he resolved to overpower them by numbers on the next day; which was, after a stout defence, so effectually done, that they were forced to abandon that outwork, and retire into the city. In the meanwhile, the burghers, who had but a day or two before raised a fresh uproar against the grand-master's impatience that he was going to give them up, as a good and an infidel who regarded neither oaths nor treaties, were perceiving their own danger, came now to the city to renew the negotiations, and only begged the liberty of sending one of their deputies along with him, to secure their interests in the capitulation. He readily consented to it; but gave them a charge to show the bashaw Achmed the treaty formerly concluded between Bajazet and his predecessor d'Aubusson, in which the former had entailed a dreadful curse on any of his successors that should infringe it. This was done, in hopes that the showing it to his master, who valued himself so much upon his strict observance of his law, might produce some qualm in him which might lengthen the agreement, for they were still as much in hopes of a succour from Europe as he was in fear of it; but to their great surprise, Achmed had no sooner perused than he tore it all in pieces, trampled it under his feet; and in a rage ordered them to be gone. The grand-master found no other resource than to send them back to him the next day; when that minister, who knew his master's impatience to have the affair concluded, quickly agreed with them upon the terms, which were in substance as follow:

1. That the churches should not be profaned.
2. That the inhabitants should not be forced to part with their children to be made janissaries.
3. That they should enjoy the free exercise of their religion.
4. That they should be free from taxes during five years.
5. That those who had a mind to leave the island should have free leave to do so.
6. That if the grand-master and his knights had not a sufficient number of vessels to transport themselves and their effects into Candia, the sultan should supply that defect.
7. That they should have 12 days allowed them, from the signing of the articles, to send all their effects on board.
8. That they should have the liberty of carrying away their relics, chalices, and other sacred utensils belonging to the great church of St John, together with all their ornaments and other effects.
9. That they should likewise carry with them all the artillery with which they were wont to arm the galleys of the order.
10. That the islands belonging to it, together with the castle of St Peter, should be delivered up to the Turks.
11. That, for the more easy execution of these articles, the Turkish army should be removed at some miles distance from the capital.
12. That the aga of the janissaries, at the head of 4000 of his men, should be allowed to go and take possession of the place.

From this time the island of Rhodes has been subject to the Turks; and, like other countries subject to that tyrannical yoke, has lost its former importance. The air is good, and the soil fertile, but ill cultivated. The capital is surrounded with triple walls and double

ditches, and is looked upon to be impregnable. It is inhabited by Turks and Jews; the Christians being obliged to occupy the suburbs, as not being allowed to stay in the town during the night. The town is situated in E. Long. 28. 25. N. Lat. 36. 54.

**RHODIOLA**, ROSE-WORT, in botany: A genus of the octandria order, belonging to the diccia class of plants; and in the natural method ranking under the 23th order, *Succulenta*. The male calyx is quadripartite; the corolla tetrapetalous. The female calyx is quadripartite, and there is no corolla; the nectaria are four; the pistils four; and there are four polyspermous capsules. There are two species, the rosea and the minor: the first grows naturally in the clefts of the rocks and rugged mountains of Wales, Yorkshire, and Westmorland. It has a very thick fleshy root, which when out or bruised sends out an odour like roses. It has thick succulent stalks, like those of orpine, about nine inches long, closely garnished with thick succulent leaves indented at the top. The stalk is terminated by a cluster of yellowish herbaceous flowers, which have an agreeable scent, but are of short continuance. The second sort is a native of the Alps, and has purplish flowers which come out later than the former; it is also of a smaller size. Both species are easily propagated by parting their roots; and require a shady situation, and dry undugged soil. The fragrance of the first species, however, is greatly diminished by cultivation.

Gen. of **RHODIUM**. See **ASPALATHUS**.

**RHODODENDRON**, DWARF ROSE-BAY, in botany: A genus of the monogynia order, belonging to the decandria class of plants; and in the natural method ranking under the 18th order, *Dicorne*. The calyx is quinquepartite; the corolla funnel-shaped; the stamina declining; the capsule quinquelocular. There are seven species: the most remarkable of which are 1. The *hirtutum*; with naked hairy leaves, grows naturally on the Alps and several mountains of Italy. It is a low shrub, which seldom rises two feet high, sending out many lignaceous branches covered with a dark brown bark, garnished closely with oval spear-shaped leaves, sitting pretty close to the branches. The flowers are entire, having a great number of fine iron-coloured spots on their edges and under side. The flowers are produced in bunches at the end of the branches in May, being one funnel-shaped petal cut into five slender segments, and of a pale-red colour. These are succeeded by oval capsules, containing ripe seeds in August. 2. The *ferruginea*, with smooth leaves, hairy on their under side, is a native of the Alps and Apennines. It rises with a shrubby stalk near three feet high, sending out many irregular branches covered with a purplish bark, and closely garnished with smooth spear-shaped entire leaves, whose borders are reflexed backward; the upper side is of a light lucid green, their under side of an iron colour. The flowers are produced at the ends of the branches, are funnel-shaped, cut into five segments, and of a pale rose colour. These plants are propagated by seeds; but, being natives of barren rocky soils and cold situations, they do not thrive in gardens, and for want of their usual covering of snow in winter are often killed by frost in this country. 3. The *chamæcistus*, or ciliated-leaved dwarf rose-bay, is a low deciduous shrub, native of Mount Baldus, and near Salzburg in Germany. It grows.

Rhodiola

Rhododendron.

Rhododendron.

grows to the height of about a yard; the branches are numerous, produced irregularly, and covered with a purplish bark. The leaves are oval, spear-shaped, small, and in the under surface of the colour of iron. The flowers are produced at the end of the branches in bunches, are of a wheel-shaped figure, pretty large, of a fine crimson colour, and handsome appearance. They appear in June, and are succeeded by oval capsules containing ripe seeds in September. 4. The Dauricum, or Daurian dwarf rose-bay, is a low deciduous shrub, and native of Dauria. Its branches are numerous, and covered with a brownish bark. The flowers are wheel-shaped, large, and of a beautiful rose colour; they appear in May, and are succeeded by oval capsules full of seeds, which in England do not always ripen. 5. The maximum, or American mountain laurel, is an evergreen shrub, and native of Virginia, where it grows naturally on the highest mountains, and on the edges of cliffs, precipices, &c. where it reaches the size of a moderate tree, though with us it seldom rises higher than six feet. The flowers continue by succession sometimes more than two months, and are succeeded by oval capsules full of seeds. 6. The Ponticum, or Rostic dwarf rose-bay, is an evergreen shrub, native of the east, and is found in shady places near Gibraltar. It grows to the height of four or five feet. The leaves are spear-shaped, glossy on both sides, acute, and placed on short foot-stalks; the branches the flowers, which are produced in clusters, are bell-shaped, and of a fine purple colour. They appear in July, and are succeeded by oval capsules containing seeds, which in England seldom attain to maturity.

In Siberia, a species of this plant is used with great success in gouty and rheumatic affections; of which the following account is given in the 5th volume of the Medical Commentaries, p. 1434, in a letter from Dr. Guthrie of St. Petersburg to Dr. Duncan of Edinburgh. "It is the *Rhododendrum chrysanthemum*, nova species, belonging to the class of dicandria, discovered by Professor Pallas in his tour through Siberia. This Alpine shrub grows near the tops of the high mountains named *Chugach*, in the neighbourhood of the river Jenissei in Siberia, and delights in the skirts of the snow-covered mountains above the region that produces trees. When the inhabitants of that country mean to exhibit it in a medicine for rheumatic disorders, they take about two ounces of the dried shrub, bark and leaves, with nine or ten ounces of boiling water, and putting them into an earthen pot, they lay on the head, and place them in an oven during the night. This infusion (for it is not allowed to boil) the sick man drinks next morning for a dose. It occasions heat, together with a degree of intoxication, resembling the effects of spirituous liquors, and a singular kind of uneasy sensation in the parts affected, accompanied with a sort of vermiculation, which is likewise confined to the diseased parts. The patient is not permitted to quench the thirst which this medicine occasions; as fluids, particularly cold water, produce vomiting, which lessens the power of the specific. In a few hours, however, all the disagreeable effects of the dose disappear, commonly with two or three stools. The patient then finds himself greatly relieved of his disorder; and has seldom occasion to repeat the medicine above two or three times to complete a cure. The inhabitants of Siberia call this shrub *chui* or

*chui*, from their drinking it, is common, a weak infusion of it, as we do the Chinese plant of that name. This practice shows that the plant, used in small quantities, must be innocent. Professor Pallas informs me, that he sent some time ago some of this shrub dried to Professor Koelpin at Stettin; and he showed me a letter from that gentleman, where he says, that he has given it with success in several cases, particularly in what he calls the *arthriticum minus*, with a tophus arthriticus on the carpus, and it produced a complete cure. It must be remarked, that the dose which these hardy Siberians take, who are also in the habit of drinking it, is all probability, be too strong for our constitution; however, it is a medicine which we may give with safety, beginning with small

Rheum  
Rhopsola.

RHEA. See RHEA.

**RHÉADEE** (*rheas*, Linnaeus's name, after Dioscorides for the red poppy), the name of the 27th order in Linnaeus's fragments of a natural method, consisting of poppy and a few genera which resemble it in habit and structure. See BOTANY, p. 462.

**RHOMBOIDES**, in geometry, a quadrilateral figure whose opposite sides and angles are equal, but is neither equilateral nor equiangular.

**RHOMBOIDES**, in anatomy, a thin, broad, and obliquely square fleshy muscle, situated between the basis of the scapula and the spina dorsi; so called from its figure. Its general use is to draw backward and upward the subspinal portion of the basis scapulae.

**RHOMBUS**, in geometry, an oblique-angled parallelogram, or quadrilateral figure, whose sides are equal and parallel, but the angles unequal, two of the opposite ones being obtuse and two acute.

**RHONE**, one of the largest rivers in France, which, rising among the Alps of Switzerland, passes through the lake of Geneva, visits that city, and then runs south-west to Lyons; which, joining the river Soane, it continues its course due south, passing by Orange, Avignon, and Arles, and falls into the Mediterranean a little above Marseilles.

**RHOPIUM**, in botany: A genus of the triandria order, belonging to the gynandria class of plants; and in the natural method ranking with those that are doubtful. The calyx is monophyllous and sexpartite; there is no corolla nor any stamina; the three anthers are each attached to one of the styli; the capsule is trilocular and sexlocular, each containing two seeds. There is only one species, viz. the *meborea*, a native of Guiana. This is a shrub rising about three or four feet in height. The flowers grow in the form of a corymbus; they are of a yellowish green colour; the capsules are black.

**RHOPOLA**, in botany: A genus of the monogynia order, belonging to the tetrandria class of plants; and in the natural method ranking with those that are doubtful. There is no calyx; the petals are four, oblong, obtuse, and narrowing at the base; the stamina are four, inserted in the corolla, and have large anthers; the seed-vessel unilocular, and contains one seed. There is only one species, viz. the *montana*. This is a shrubby plant growing in Guiana, and remarkable for a great number of branches sent off from its trunk in every direction, and for the fetid smell of the wood and bark of this plant.

Rhubarb

Rhus.

**RHUBARB.** See **RHEUM.**

**RHUMB**, in navigation, a vertical circle of any given place, or intersection of such a circle with the horizon; in which last sense rhumb is the same with a point of the compass.

**Rhumb-Line** is also used for the line which a ship describes when sailing in the same collateral point of the compass, or oblique to the meridians.

**RHUS**, sumach, in Botany. A genus of the trigynia order, belonging to the pentstemon class of plants, and in the natural method ranking under the order *Dumosa*. The calyx is quinquepartite; the petals five; the berry monospermous. There are six species, of which the most remarkable are,

1. The coriaria, or elm-leaved sumach, grows naturally in Italy, Spain, Turkey, Syria, &c. The branches of this tree are used instead of oak-bark for tanning of leather; and it is said that the Turkey leather is all tanned with this shrub. It hath a woody stalk, which divides at bottom into many irregular branches, rising to the height of eight or ten feet; the bark is hairy, of an herbaceous brown colour; the leaves are winged, composed of seven or eight pair of lobes, terminated by an odd one, bluntly sawed on their edges, hairy on their under side, of a yellowish-green colour, and placed alternately on the branches; the flowers grow in loose panicles on the end of the branches, which are of a whitish herbaceous colour, each panicle being composed of several spikes of flowers sitting close to the footstalks. The leaves and seeds of this sort are used in medicine, and are esteemed very restringent and styptic.

2. The typhinum, Virginian sumach, or vinegar plant, grows naturally in almost every part of North America. This hath a woody stem, with many irregular branches, which are generally crooked and deformed. The young branches are covered with a soft velvet-like down, resembling greatly that of a young stag's horn, both in colour and texture, from whence the common people have given it the appellation of *stag's horn*; the leaves are winged, composed of six or seven pair of oblong heart-shaped lobes, terminated by an odd one, ending in acute points, hairy on their under side, as is also the midrib. The flowers are produced in close tufts at the end of the branches, and are succeeded by seeds, enclosed in purple woolly succulent covers; so that the bunches are of a beautiful purple colour in autumn; and the leaves, before they fall in autumn, change to a purplish colour at first, and before they fall to a ferrile-mort. This plant, originally a native of North America, has been long cultivated in the north of Germany, and is lately introduced into Russia. It has got the name of the *vinegar plant* from the double reason of the young germen of its fruit, when fermented, producing either new or adding to the strength of old weak vinegar, whilst its ripe berries afford an agreeable acid, which might supply the place when necessary of the vitric acid. The powerful astringency of this plant in all its parts recommends it as useful in several of the arts. As for example, the ripe berries boiled with alum make a good dye for hats. The plant in all its parts may be used as a succedaneum for oak-bark in tanning, especially the white glove leather. It will likewise answer to prepare a dye for black, green, and yellow colours; and with martial vitriol it makes a good ink. The milky juice

that flows from incisions made in the trunk or branches, makes when dried the basis of a varnish little inferior to the Chinese. Bees are remarkably fond of its flowers; and it affords more honey than any of the flowering shrubs, so that it may prove a useful branch of economy, where rearing these insects is an object. The natives of America use the dried leaves as tobacco.

3. The glabrum, with winged leaves, grows naturally in many parts of North America; this is commonly titled by the gardeners *New England sumach*. The stem of this is stronger and rises higher than that of the former; the branches spread more horizontally; they are not quite so downy as those of the last, and the down is of a brownish colour; the leaves are composed of many more pair of lobes, which are smooth on both sides; the flowers are disposed in loose panicles, which are of an herbaceous colour.

4. The Carolinianum, with sawed winged leaves, grows naturally in Carolina; the seeds of this were brought from thence by the late Mr. Catesby, who has given a figure of the plant in his *Natural History of Carolina*. This is by the gardeners called the *scarlet Carolinian sumach*; it rises commonly to the height of seven or eight feet, dividing into many irregular branches, which are smooth, of a purple colour, and powdered over with a grayish powder, as are also the footstalks of the flowers. The leaves are composed of seven or eight pair of lobes, terminated by an odd one; these are not always placed exactly opposite on the midrib, but are sometimes alternate. The upper side of the lobes are of a dark green, and their under hoary, but smooth. The flowers are produced at the end of the branches in very close panicles, which are large, and of a bright red colour.

5. The Canadense, with winged spear-shaped leaves, grows naturally in Canada, Maryland, and several other parts of North America. This hath smooth branches of a purple colour, covered with a gray pounce. The leaves are composed of seven or eight pair of lobes, terminated by an odd one; the lobes are spear-shaped, sawed on their edges, of a lucid green in their upper surface, but hoary on their under, and are smooth. The flowers are produced at the end of the branches in large panicles, which are composed of several smaller, each standing upon separate footstalks; they are of a deep red colour, and the whole panicle is covered with a gray pounce, as if it had been scattered over them.

6. The copallinum, or narrow-leaved sumach, grows naturally in most parts of North America, where it is known by the title of *sumach*, probably from the place where it grows. This is of humbler growth than either of the former, seldom rising more than four or five feet high in Britain, dividing into many spreading branches, which are smooth, of a light brown colour, closely garnished with winged leaves, composed of four or five pair of narrow lobes, terminated by an odd one; they are of a light green on both sides, and in autumn change purplish. The midrib, which sustains the lobes, has on each side a winged or leafy border, which runs from one pair of lobes to another, ending in points at each pair, by which it it easily distinguished from the other sorts. The flowers are produced in loose panicles at the end of the branches, of a yellowish herbaceous colour.

Thes.

Rhus.

These six sorts are hardy plants, and will thrive in the open air here. The first and fourth sorts are not quite so hardy as the others, so must have a better situation, otherwise their branches will be injured by severe frost in the winter. They are easily propagated by seeds, which if sown in autumn the plants will come up the following spring; but if they are sown in spring, they will not come up till the next spring; they may be either sown in pots, or the full ground. If they are sown in pots in autumn, the pots should be placed under a common frame in winter, where the seeds may be protected from hard frost; and in the spring, if the pots are plunged into a very moderate hotbed, the plants will soon rise, and have thereby more time to get strength before winter. When the plants come up, they must be gradually hardened to bear the open air, into which they should be removed as soon as the weather is favourable, placing them where they may have the morning sun; in the summer, they must be kept clear from weeds, and in dry weather watered. Toward autumn it will be proper to stint their growth by keeping them dry, that the extremities of their shoots may harden; for if they are replete with moisture, the early frosts in autumn will pluck them, which will cause their shoots to decay almost to the bottom if the plants are not removed from them. If the pots are put under a common frame in autumn, it will secure the plants from injury; for while they are young and the shoots soft, they will be in danger of suffering, if the winter proves very severe; but in mild weather they must always enjoy the open air, therefore should never be covered but in frost. The spring following, just before the plants begin to shoot, they should be shaken out of the pots, and carefully separated, so as not to tear the roots; and be planted in a nursery, in rows three feet asunder, and not less than in the rows. In this nursery they must stand two years to get strength, and then may be transplanted where they are to remain.

Linnaeus has included in this genus the *Rhus copallina* or poison tree, under the name of *Rhus copallina* or *poison-tree*. This grows naturally in Virginia, Pennsylvania, New England, Carolina, and Japan, rising with a strong woody stalk to the height of 40 feet and upwards; though in this country it is seldom seen above 20; by reason of the plants being extremely tender. The bark is brown, inclining to gray; the branches are furnished with winged leaves composed of three or four pair of lobes terminated by an odd one. The lobes vary greatly in their shape, but for the most part they are oval and spear-shaped. The footstalks become of a bright purple towards the latter part of summer, and in autumn all the leaves are of a beautiful purple before they fall off.

All the species of sumach abound with an acrid milky juice, which is reckoned poisonous; but this property is most remarkable in the vernix. The most distinct account of it is to be found in Professor Kalm's Travels in North America. "An incision (says he) being made into the tree, a whitish yellow juice, which has a nauseous smell, comes out between the bark and the wood. This tree is not known for its good qualities, but greatly so for the effect of its poison; which, tho' it is noxious to some people, yet does not in the least affect others. And therefore one person can handle the tree as he pleases, cut it, peel off its bark, rub it or

the wood upon his hands, smell at it, spread the juice upon his skin, and make more experiments, with no inconvenience to himself; another person, on the contrary, dares not meddle with the tree while its wood is fresh; nor can he venture to touch a hand which has handled it, nor even to expose himself to the smoke of a fire which is made with this wood, without soon feeling its bad effects, for the face, the hands, and frequently the whole body, swells excessively, and is affected with a very acute pain. Sometimes bladders or blisters arise in great plenty, and make the sick person look as if he was visited by a leprosy. In some people the skin, or cuticle, peels off in a few days, as in the case when a person has scalded or burnt any part of his body. Nay, the nature of some persons will not allow them to approach the place where the tree grows, or to expose themselves to the wind which carries the effluvia or exhalations of this tree with it, without letting them feel the inconvenience of the swelling which I have just now described. Their eyes are sometimes shut up for one, or two, or more days together, by the swelling. I know two brothers, one of whom could without danger handle this tree in what manner he pleased, whereas the other could not come near it without swelling. A person sometimes does not know that he has touched this poisonous plant, or that he has been near it, before his face and hands show it by their swelling. I have known old people who were more afraid of this tree than of a viper; and I was acquainted with a person who, merely by the noxious exhalations of it, was swelled to such a degree, that he was as stiff as a log of wood, and could only be turned about in sheets.

"I have tried experiments of every kind with the poison-tree on myself. I have spread its juice upon my hands, cut and broke its branches, peeled off its bark, and rubbed my hands with it, smelt at it, carried pieces of it in my bare hands, and repeated all this frequently, without feeling the baneful effects so commonly annexed to it; but I, however, once experienced, that the poison of the sumach was not entirely without effect upon me. On a hot day in summer, as I was in some degree of perspiration, I cut a branch of the tree, and carried it in my hand for about half an hour together, and smelt at it now and then. I felt no effects from it in the evening. But next morning I awoke with a violent itching of my eyelids and the parts thereabouts; and this was so painful, that I could hardly keep my hands from it. It ceased after I had washed my eyes for a while with very cold water. But my eyelids were very stiff all that day. At night the itching returned; and in the morning when I awoke, I felt it as ill as the morning before, and I used the same remedy against it. However, it continued almost for a whole week together; and my eyes were very red, and my eyelids were with difficulty moved during all that time. My pain ceased entirely afterwards. About the same time I had spread the juice of the tree very thick upon my hand. Three days after, they occasioned blisters, which soon went off without affecting me much. I have not experienced any thing more of the effects of this plant, nor had I any desire so to do. However, I found that it could not exert its power upon me when I was not perspiring.

"I have never heard that the poison of this sumach

Rhus.

Rhyme  
|  
Riband.

has been mortal, but the pain ceases after a few days duration. The natives formerly made their flutes of this tree, because it has a great deal of pith. Some people assured me, that a person suffering from its noisome exhalations, would easily recover by spreading a mixture of the wood burnt to charcoal, and hog's lard, upon the swelled parts. Some asserted, that they had really tried this remedy. In some places this tree is rooted out, on purpose that its poison may not affect the workmen."

The natives are said to distinguish this tree in the dark by its extreme coldness to the touch. The juice of some kinds of fumach, when exposed to the heat of the sun, becomes so thick and clammy, that it is suited for bird-lime, and the inspissated juice of the *copallum* is said to be the fine varnish of Japan. A balsam made with the fresh juice of the poison tree, applied to the feet, is said by Hughes, in his *Natural History of Barbadoes*, to kill the vermine called by the West Indians *chigers*. Very good vinegar is made from an infusion of the fruit of an American fumach, which for that reason is called the *vinegar tree*. The resin called *gum copal* is from the *rhus copallinum*. See *CORAL*.

**RHYME**, **RHIME**, *Ryme*, or *Rime*, in poetry, the similar sound or cadence and termination of two words which end two verses, &c. Or rhyme is a similitude of sound between the last syllable or syllables of a verse, succeeding either immediately or at a distance of two or three lines. See *POETRY*, N° 177, &c.

**RHYMER** (Thomas the), was a native of the parish of Earlstown, in the county of Berwick. His real name and title was Sir Thomas Lermont. He lived at the west end of Earlstown, where part of his house is still standing, called *Rhymer's Tower*; and there is a stone built in the fore wall of the church with this inscription on it,

Auld Rhymer's race lies in this place.

He lived in the 13th century, and was contemporary with one of the earls of March, who lived in the same place.

**RHYTHM**, in music, the variety in the movement, as to the quickness or slowness, length or shortness, of the notes. Or it may be defined more generally, the proportion which the parts of the motion have to each other.

**RIAL**, or **RYAL**, a Spanish coin. See *MONEY-Table*.

**RIAL**, or *Royal*, is also the name of a piece of gold anciently current among us for 10s.

**RIBAN**, or **RIBBAN**, in heraldry, the eighth part of a bend. See *HERALDRY*, p. 447.

**RIBAND**, or **RIBBON**, a narrow sort of silk, chiefly used for head ornaments, badges of chivalry, &c.

In order to give our readers an idea of the manner in which this curious and valuable branch of manufactures is managed, a view of the ribbon weaver at his loom is represented in Plate CCCCXXXV. where, 1. Is the frame of the loom. 2. The *caille*, containing 48 pulleys. 3. The branches, on which the pulleys turn. 4. The tires, or the riding cords, which run on the pulleys, and pull up the high-lisses. 5. The list-sticks, to which the high-lisses are tied. 6. The high-lisses, or lifts, are a number of long threads, with platines, or plate-leads, at the bottom; and ringlets, or

Riband,  
Ribanda.

loops, about their middle, through which the cords or cross threads of the ground harness ride. 7. The plate-leads, or platines, are flat pieces of lead, of about six inches long, and three or four inches broad at the top, but round at the bottom; some use black slates instead of them: their use is to pull down those lisses which the workman had raised by the treddle, after his foot is taken off. 8. The branches or cords of the ground harness, which go thro' the loops in the middle of the high-lisses: on the well-ordering of these cords chiefly depends the art of ribbon weaving, because it is by means of this contrivance that the weaver draws in the thread or silk that makes the flower, and rejects or excludes the rest. 9. The batton: this is the wooden frame that holds the reed or shuttle, and beats or closes the work: where, observe, that the ribbon weaver does not beat his work; but as soon as the shuttle is passed, and his hand is taken away, the batton is forced, by a spring from the top, to beat the work close. 10. The shuttle, or reed. 11. The spring of the batton, by which it is made to close the work. 12. The long harness are the front reeds, by which the figure is raised. 13. The *laguas* are the long pieces of round or square lead, tied to the end of each thread of the long harness to keep them tight. 14. The broad piece of wood, about a foot square, leaning somewhat forward, intended to ease the weaver as he stoops to his shuttle; it is fixed in the middle of the breast beam. Some weavers, instead of this, have a contrivance of a cord or rope that is fastened to the front frame, and comes across his breast; this is called a *stopfall*. 15. The seat behind this leans forward very much. 16. The footstool to the treddles. 17. The breast beam, being a cross beam that passes from one of the standards to the other, as to front the workman's breast: to this beam is fixed a roll, upon which the ribbon passes in its way to be rolled upon the roller, that turns a little below. The clamps, or pieces of wood, in which the breast beam that confine the treddles rest. 18. The treddles are narrow pieces of wood, to the ends of which the threads that move the lisses are fastened. 19. The *treddle-board* is a long board, distinguished from the riding cords, by being full of holes, which divide them, in order to prevent the plate-leads, which are tied to the high-lisses, from falling them too high when the workman's foot is on the treddle: which stop is made by a knot in the treddle cord, too big to be forced through that hole in the board. 20. The lames are two pieces of thin narrow boards, only used in plain works, and then to supply the place of the long harness. 21. The knee roll, by which the weaver rolls up his ribbon as he sees proper, by bit and bit as it is finished. 22. The back rolls, on which the warp is rolled. It is to be observed, that there are always as many rolls as colours in the work to be wove. 23. The clamps, which support the rollers. 24. The returning sticks, or, as others call them, the *returns*, or the *tumblers*, or *pulley*, to which the tiers are tied, to clear the course of cords through the high-lisses. 25. The catchboard for the tumblers. 26. The tireboard. 27. The buttons for the knee rolls and treddle-board, described in number 20.

Ribbons of all sorts are prohibited from being imported.

**RIBANDS** (from *rib* and *bend*), in naval architecture,

Ribands,  
Ribes.

ture, long narrow flexible pieces of timber, nailed up on the outside of the ribs, from the stem to the stern-post, so as to envelope the ship lengthwise, and appear on her side and bottom like the meridians on the surface of the globe. The ribands being judiciously arranged with regard to their height and distance from each other, and forming regular sweeps about the ship's body, will compose a kind of frame, whose interior surface will determine the curve of all the intermediate or filling-timbers which are stationed between the principal ones. As the figure of the ship's bottom approaches to that of a conoid, and the ribands have a limited breadth, it is apparent that they cannot be applied to this convex surface without forming a double curve, which will be partly vertical and partly horizontal; so that the vertical curve will increase by approaching the stem, and still more by drawing near the stern-post. It is also evident, that by deviating from the middle line of the ship's length, as they approach the extreme breadth at the middle frame, the ribands will also form a horizontal curve. The lowest of these, which is terminated upon the stem and stern-post, at the height of the rising line of the floor, and answers to the upper part of the floor-timber upon the midship-frame, is called the *floor-riband*. That which coincides with the main transom, at the height of the lower deck upon the midship-frame, is termed the *breadth-riband*; and the rest, which are placed between these two, are called *intermediate ribands*. See SHIP-BUILDING.

**RIBES, the Currant and Gooseberry bush:** A genus of the monogynia order, belonging to the pentagynia class of plants; and in the natural method ranked under the 6th order, *Pomacea*. There are five genera, and *Lapina* inserted into the calyx; the style is long, and the berry polyspermous, inferior.

The currant and the gooseberry were long considered as a separate genus; *ribes* the currant, and *gooseberry* the gooseberry; but they are now joined together, the *grossularia* being made a species of *ribes*; the currant kinds having inermous or thornless branches, and racemous clusters of flowers and fruit; the gooseberry have spinous branches, and flowers and fruit on the most part singly.

There are three species of the currant tree, two of which, and their varieties, merit culture for their fruit; the other as a plant of variety or observation: all of which are inermous or unarmed, having no thorns on the branches.

*Ribes rubrum*, common red currant tree, &c. hath a shrubby stem, dividing low into many branches, forming a bushy head, five or six feet high or more, without thorns; broad trilobate leaves, and smooth pendulous clusters of plane greenish flowers, succeeded by small clusters of berries. It grows naturally in woods and the hedges in most parts of Europe, and comprises all sorts of red and white currants; as, common small red currant—large bunched red currant—Champaigns pale-red currant—common small white currant—large white Dutch currant—yellow blotched-leaved currant—silver striped-leaved—gold striped-leaved—gooseberry-leaved. All these sorts are varieties of one species, *ribes rubrum*, or common red currant; it being the parent from which all the others were first obtained from the seed, and improved by culture. They all flower in the spring, and the fruit ripens in June and

Ribes

July; and by having the trees in different situations and modes of training, such as plantations of standards in the open quarters for the general supply, others trained against walls or pales of different aspect, the fruit may be continued ripe in good perfection from about the middle of June until November, provided the later crops are defended with mats or nets from the birds.

2. The *nigrum*, or black currant tree, hath a shrubby stem, dividing low into many branches, forming a bushy head five or six feet high; broad trilobate leaves of a rusty colour, and having racemous clusters of oblong greenish flowers, succeeded by thin clusters of black berries. The fruit of this species being of a somewhat strong and somewhat physical relish, is not generally much used; however, is accounted very wholesome: there is a mode of it a syrup of high estimation for the stomach and quinsies; hence the fruit is often called *quinsy berries*. There is a variety called the *Pennsylvanian black currant*, having smaller shoots and leaves, not strong scented, and small fruit but of little value; so the shrub is esteemed only for variety and shrubberies. The mode of bearing of all the varieties of currants is both in the old and young wood all along the sides of the branches and shoots, often upon a sort of small sprigs and snags, producing the fruit in numerous long pendulous clusters.

3. The *grossularia*, or common gooseberry bush, rises with a low shrubby stem, dividing low into a very branchy bushy head, armed with spines; trilobate smallish leaves, having hairy ciliated footstalks; and small greenish flowers, succeeded by hairy berries. It consists of many varieties, of different sizes and colours.

4. The *reclinatum*, or reclinated broad-leaved gooseberry bush, rises with a low shrubby stem, and reclinated somewhat prickly branches, trilobate broadish leaves, and small greenish flowers, having the pedunculi furnished with triphyllous bractea.

5. The *oxyacanthoides*, or oxyacantha-leaved gooseberry, hath a shrubby stem, and branches armed on all sides with spines, and largish trilobate hawthorn leaves.

6. The *uva crispa*, or smooth gooseberry, hath a shrubby stem, and branches armed with spines; trilobate leaves; pedicles having monophyllous bractea; and smooth fruit.

7. The *cynobati*, or prickly-fruited gooseberry bush, hath a shrubby stem and branches, armed with spines, mostly at the axillas, and prickly fruit in clusters.

All the above seven species of ribes, both currants and gooseberry kinds, and their respective varieties, are very hardy shrubs, that prosper almost anywhere, both in open and shady situations, and in any common soil; bearing plentifully in any exposure, though in open sunny situations they produce the largest and fairest fruit, ripening to a richer vinous flavour; but it is eligible to plant them in different situations and aspects, in order to have the fruit as early and late as possible.

They are commonly planted in the kitchen-garden, mostly as dwarf standards, in the open quarters, for the general supply; being disposed sometimes in continued plantations in rows, eight or ten feet by six asunder, where great quantities of the fruit are required for market or other large supplies; and are sometimes disposed in single ranges round the outward edge

Richardson and in the natural method ranking under the 47th order, *Stellata*. The calyx is lespartite; the corolla monopetalous, and subcylindrical; and there are three seeds.

RICHARDSON (Samuel), a celebrated English sentimental novel writer, born in 1688, was bred to the business of a printer, which he exercised all his life with eminence. Though he is said to have understood no language but his own, yet he acquired great reputation by his three epistolary novels, entitled *Pamela*, *Clarissa*, and *Sir Charles Grandison*; which show an uncommon knowledge of human nature. His purpose being to promote virtue, his pictures of moral excellence are by much too highly coloured; and he has described his favourite characters such rather as we might wish them to be, than as they are to be found in reality. It is also objected by some, that his writings have not always the good effect intended; for that, instead of improving natural characters, they have fashioned many artificial ones; and have taught delicate and refined ladies and gentlemen to despise every one but their own self-enamoured persons. But after all that can be urged of the ill effects of Mr. Richardson's writings on weak minds, eager to adopt characters they esteem beautiful; a sensible reader will improve more by studying such models of perfection, than of those which are the natural standard of human frailty, and whose faults are artfully exaggerated so as to fix and misemploy the attention on them. A stroke of the palsy seized off Mr. Richardson, after a few days illness, on the 4th of July 1761. He was a man of great piety, and a lover of virtue; which, for aught we have ever heard to the contrary, he showed in his life and conversation as well as in his writings. Besides the novels above mentioned, he is the author of an *Account of a Journey through Britain*, 4 vols. and a *Collection of Familiar Letters upon business and other subjects*. He is said from his childhood to have delighted in letter-writing; and therefore was the more surprised and surprised to find himself into that form; which, he thought, the history in some respects, yet lengthened with uninteresting parts, and formalities that were nothing, and on that account is sometimes found tedious and fatiguing.

The most eminent writers of our own country, and even of foreign parts, have paid their tribute to the extraordinary talents of Mr. Richardson, whose works have been published in almost every language and country of Europe. They have been greatly admired, notwithstanding every difficulty of manner, or every disadvantage of translation. M. Diderot, a celebrated French author, speaking of the means employed to move the passions, in his *Essay on Dramatic Poetry*, mentions Richardson as a perfect master of that art: "How striking (says he), how pathetic, are his descriptions! His personages, though silent, are alive before me; and of those who speak, the actions are still more affecting than the words."—The famous John-James Rousseau, speaking, in his letter to M. d'Alembert, of the novels of Richardson, asserts, "that nothing was ever written equal to, or even approaching them, in any language."—Mr Aaron Hill calls his *Pamela* a "delightful nursery of virtue."—Dr Warton speaks thus of *Clementina*: "Of all representations of madness, that of *Clementina*, in the *History of Sir Charles Grandison*,

VOL. XVI. Part I.

is the most deeply interesting. I know not whether Richardson even the madness of Lear is wrought up, and expressed, by so many little strokes of nature and passion. It is absolute pedantry to prefer and compare the madness of Orestes in Euripides to this of *Clementina*."—Dr Johnson, in his Introduction to the 97th number of the *Rambler*, which was written by Mr Richardson, observes, "that the reader was indebted for that day's entertainment to an author, from whom the age has received great favour, who has enlarged the knowledge of human nature, and taught the passions to move at the command of virtue;" and, in his Life of Rowe, he says, "that the character of Lothario seems to have been suggested by Richardson into that of Lovelace; but he has excelled his original in the moral effect of the fiction; Lothario, with gaiety which cannot be hated, and honesty which cannot be despised, retains too much of the impostor's kindness. It was in the power of Richardson alone to teach us at once esteem and detestation; to make virtuous repentment overpower all the benevolence which wit, and elegance, and courage, naturally excite; and to lose at last the hero in the villain."—Dr Young very pertinently observed, that Mr Richardson, with the mere advantages of nature, improved by a very moderate progress in education, struck out at once, and of his own accord, into a new province of writing, in which he succeeded to admiration. And what is more remarkable, that he not only began, but finished, the plan on which he set out, leaving no room for any one after him to render it more complete: and that not one of the various writers that have ever since attempted to imitate him, have in any respect equalled, or at all approached near him. This kind of romance is peculiarly his own; and "I consider him (continues the doctor) as a truly great natural genius; as great and supereminent in his way as Shakespeare and Milton were in theirs."

RICHARDSON (Jonathan), a celebrated painter of *Walpole's* heads, was born about the year 1665, and against his inclination was placed by his father-in-law apprentice to a scrivener, with whom he lived six years; when obtaining his freedom by the death of his master, he followed the bent of his disposition, and at 20 years old became the disciple of Riley; with whom he lived four years, whose niece he married, and of whose manner he acquired enough to maintain a solid and lasting reputation, even during the lives of Kneller and Dahl; and to remain at the head of the profession when they went off the stage.

There is strength, roundness, and boldness in his colouring; but his men want dignity, and his women grace. The good sense of the nation is characterized in his portraits. You see he lived in an age when neither enthusiasm nor servility were predominant. Yet with a pencil so firm, possessed of a numerous and excellent collection of drawings, full of the theory, and profound in reflections on his art, he drew nothing well below the head, and was void of imagination. His attitudes, draperies, and back-grounds, are totally insipid and unmeaning; so ill did he apply to his own practice the sagacious rules and hints he bestowed on others. Though he wrote with fire and judgment, his paintings owed little to either. No man dived deeper into the inexhaustible stores of Raphael, or was more smitten with the native lustre of Vandyck. Yet though capa-

G g

ble

Richardson, ble of tasting the elevation of the one and the elegance of the other, he could never contrive to see with their eyes, when he was to copy nature himself. One wonders that he could comment their works so well, and imitate them so little.

He quitted business himself some years before his death; but his temperance and virtue contributed to protract his life to a great length in the full enjoyment of his understanding, and in the felicity of domestic friendship. He had had a paralytic stroke, that affected his arm, yet never disabled him from his customary walks and exercise. He had been in St James's park, and died suddenly at his house in Queen's-square on his return home, May 28. 1745, when he had passed the 80th year of his age. He left a son and four daughters, one of whom was married to his disciple Mr Hudson, and another to Mr Grigson an attorney. The taste and learning of the son, and the harmony in which he lived with his father, are visible in the joint works they composed. The father in 1719 published two discourses: 1. An Essay on the whole Art of Criticism as it relates to Painting; 2. An Argument in behalf of the Science of a Connoisseur; bound in one volume octavo. In 1722 came forth an Account of some of the statues, bas-reliefs, drawings, and pictures, in Italy, &c. with Remarks by Mr Richardson, senior and junior. The son made the journey; and from his notes, letters, and observations, they both at his return compiled this valuable work. As the father was a formal man, with a slow, but loud and sonorous voice, and, in truth, with some affectation in his manner; and as there is much singularity in his style and expression, these peculiarities (for they were scarcely foibles) struck superficial readers, and between the laughers and the envious the book was much ridiculed. Yet both this and the former are full of matter, good sense, and instruction; and the very quaintness of some expressions, and their laboured novelty, show the difficulty the author had to convey mere visible ideas through the medium of language. Those works remind one of Cibber's inimitable treatise on the stage: when an author writes on his own profession, feels it profoundly, and is sensible his readers do not, he is not only excusable, but meritorious, for illuminating the subject by new metaphors or bolder figures than ordinary. He is the cockcomb that sneers, not he that instructs, in appropriated diction.

If these authors were censured when conversant within their own circle, it was not to be expected that they would be treated with milder indulgence when they ventured into a sifter region. In 1734, they published a very thick octavo, containing explanatory notes and remarks on Milton's Paradise Lost, with the life of the author, and a discourse on the poem. Again were the good sense, the judicious criticisms, and the sentiment that broke forth in this work, forgotten in the singularities that distinguish it. The father having said in apology for being little conversant in classic literature, that he had looked into them through his son, Hogarth, whom a quibble could furnish with wit, drew the father peeping through the nether end of a telescope, with which his son was perforated, at a Virgil aloft on a shelf. Yet how forcibly Richardson entered into the spirit of his author, appears from his comprehensive expression, that *Milton was an ancient, born*

*two thousand years after his time.* Richardson, however, was as incapable of reaching the sublime or harmonious in poetry, as he was in painting, though so capable of illustrating both. Some specimens of verse that he has given us here and there in his works, excite no curiosity for more, though he informs us in his Milton, that if painting was his wife, poetry had been his secret concubine. It is remarkable, that another commentator of Milton has made the same confession.

—Sunt et mihi carmina, me quoque dicunt  
Vatem pastores—

says Dr Bentley. Neither the doctor nor the painter add, *sed non ego credulus illis*, though all their readers are ready to supply it for both. Besides his pictures and commentaries, we have a few etchings by his hand, particularly two or three of Milton, and his own head. The sale of his collection of drawings, in February 1747, lasted 18 days, and produced about 2060*l.* his pictures about 700*l.* Hudson his son-in-law bought many of the drawings.

RICHELET, (Cesar Peter), a French writer, born in 1631 at Chemin in Champagne. He was the friend of Patru and Ablancourt, and like them applied himself to the study of the French language with success. He compiled a dictionary of that language, full of new and useful remarks, but exceptionable, as containing many satirical reflections and obscenities. The best edition is that of Lyons, 3 vols. folio, 1728. He also collected a small dictionary of rhymes, and composed some other pieces in the grammatical and critical way. He died in 1698.

RICHEs, a word used always in the plural number, means wealth, money, possession, or a splendid and opulent appearance. When used to express the fortune of private persons, whether patrimonial or acquired, it signifies *opulence*; a term which expresses not the enjoyment, but the possession, of numerous superfluities. The riches of a state or kingdom express the product of industry, of commerce, of different incorporated bodies, of the internal and external administration of the principal members of which the society is composed, &c.

Our Saviour says, that it is more easy for a camel to go through the eye of a needle, than for a rich man to enter the kingdom of heaven; and we find, in fact, that riches frequently bring along with them a degree of inattention, lukewarmness, and irreligion, such as sufficiently confirms the divine assertion; which is merely a general truth, and which by no means asserts the absolute impossibility of being virtuous and rich at the same time. For as the ancient philosophers wisely taught, riches considered in themselves, and abstractedly from the bad purposes to which they may be applied, are not necessarily incompatible with virtue and wisdom. They are indeed absolutely indifferent; in good hands they will be useful, and promote the cause of truth, virtue, and humanity; and in bad hands they are the source of much mischief; on the one hand they confer the power of doing much good, and on the other they are equally powerful in doing ill.

To men, however, whose principles of virtue are not sufficiently founded, riches are unquestionably a dangerous and seducing bait; and as the ancients rightly taught, they are to the greatest number of men, an infinite

Riches,  
Riches.

**Riches.** infinite variety of circumstances, a powerful obstacle to the practice of moral virtues, to the progress of truth, and a weight which prevents them from rising to that degree of knowledge and perfection of which human nature is capable. They multiply without ceasing the occasions of vice, by the facility which they give to satisfy a multitude of irregular passions, and to turn at length those who are attached to them from the road of virtue, and from the desire of inquiring after truth.

It is this which Seneca means to express, when he says, "that riches in a vast number of cases have been a great obstacle to philosophy; and that, to enjoy freedom of mind necessary for study, a man must live in poverty, or as if he were poor. Every man (adds he) who wishes to lead a pleasant, tranquil, and secure life, must avoid, as much as possible, the deceitfulness of riches, which are a bait with which we allow ourselves to be taken as in a snare, without afterwards having the power to extricate ourselves, being so much the more unhappy, that we believe we possess them, while, on the contrary, they tyrannise over us." *Senec. Epist. 17. and Epist. 8.*

The wise man (says the same author in another place) does not love riches to excess, but he would not choose wholly to divest himself of them; he does not receive them into his soul, but into his house; he is careful of them, and employs them for the purpose of opening a wide field for virtue, and of making it appear in all its splendour. Who can doubt that a wise man has not more occasions of displaying the elevation and greatness of his mind when he is possessed of riches than when he labours under indigence, since, in the last condition, he can exercise only one virtue, namely *restraint*; whereas, riches give him an opportunity of displaying in their greatest lustre, the virtues of *temperance, liberality, diligence, regularity, and magnificence*. There is no occasion, then, to prohibit philosophy from the use of wealth, or to condemn wisdom to poverty. The philosopher may possess the greatest riches, provided he has not employed force or shed blood in acquiring them; provided he has not gained them by unjust or illegal means; in a word, provided the use which he makes of them be as pure as the source from which they were derived, and no person (the curious excepted) regretting his possession; he will not refuse the kindness of fortune, and will enjoy, without shame or pride, the wealth acquired by honest means; he will have more reason to glory, if, after exposing his riches to the view of the whole world, he can desire any person to carry away the reward of treachery or the fruits of oppression. If, after these words, his riches continue undiminished, this man is truly great, and worthy to be rich. If he has not allowed to enter into his possession the smallest piece of money gained by unwarrantable means, neither will he refuse the greatest riches, which are the blessings of fortune, and the fruit of virtue; if he can be rich, he will choose to be so, and he shall have riches; but he will regard them as blessings of uncertain possession, and of which he may be every moment deprived; he will not permit them to be a load to himself or to others; he will give them to the good, or to those whom he would make good; but he will give them with the nicest wisdom, taking care always to distribute them to the most

worthy, and to those who remember that they must give an account, as well of the wealth which they receive from heaven, as of the purposes to which it is applied." *Senec. de Vita Beata, cap. 21, 22, et 23.*

**RICHLIEU** (John Armand du Plessis de), cardinal of Richlieu and Fronfac, bishop of Lucon, &c. was born at Paris in 1585. He was of excellent parts: and at the age of 22 had the address to obtain a dispensation to enjoy the bishopric of Lucon in 1607. Returning into France, he applied himself in a particular manner to the function of preaching; and his reputation in this way procured him the office of almoner to the queen Mary de Medicis. His abilities in the management of affairs advanced him to be secretary of state in 1616; and the king soon gave him the preference to all his other secretaries. The death of the marquis d'Acad having produced a revolution in state affairs, Richlieu retired to Avignon: where he employed himself in composing books of controversy and piety. The king having recalled him to court, he was made a cardinal in 1622; and, two years after, first minister of state, and grand-master of the navigation. In 1626, the isle of Rhé was preserved by his care, and Rochelle taken, having stopped up the haven by that famous dyke which he ordered to be made there. He accompanied the king to the siege of Casal, and contributed not a little to the raising of it in 1629. He also obliged the Huguenots to the peace at Alets, which proved the ruin of that party; he took Pamerol, and succoured Casal besieged by Spinola. In the mean time the nobles found fault with his conduct, and persuaded the king to discard him. The cardinal, for his part, was unmoved with it; and by his reasonings overthrew what was thought to be determined against him; so that, instead of being disgraced, he from that moment became more powerful than ever. He punished all his enemies in the same manner as they would have had him suffer; and the day which produced this event, so glorious to Cardinal Richlieu, was called the *day of dupes*. This able minister had from thenceforwards an ascendancy over the king's mind; and he now resolved to humble the excessive pride of the house of Austria. For that purpose he concluded a treaty with Gustavus Adolphus king of Sweden, for carrying the war into the heart of Germany. He also entered into a league with the duke of Bavaria; secured Lorrain; raised a part of the princes of the empire against the emperor; treated with the Dutch to continue the war against Spain; favoured the Catalans and Portuguese till they shook off the Spanish yoke; and, in short, took so many different measures, that he accomplished his design; and after having carried on the war with success, was thinking of concluding it by a peace, when he died at Paris on the 4th of December 1642, aged 58. He was interred in the Sorbonne, where a magnificent mausoleum is erected to his memory. This great politician made the arts and sciences to flourish; formed the botanical garden at Paris, called the *king's garden*; founded the French academy; established the royal printing-house; erected the palace afterwards called *Le Palais Royal*, which he presented to the king; and rebuilt the Sorbonne with a magnificence that appears truly royal. Besides his books of controversy and piety, there go under the name of this minister, *A Journal*, in 2 vols. 12mo; and a *Political Testament*, in 12mo; all treating of politics and state affairs. Cardinal

nal Magazine pursued Richieu's plan, and completed many of the schemes which he had begun, but left unfinished.

**RICINUS**, or **PALMA CHRISTI**, in botany: A genus of the monodelphia order, belonging to the monœcia class of plants; and in the natural method ranking under the 38th order, *Tricocco*. The male calyx is quinquepartite; there is no corolla; the stamens numerous. The female calyx is tripartite; there is no corolla, but three bifid styles, with a trilobular capsule and a single seed. There are three species, of which the most remarkable is the common, or common palma Christi. This tree is of speedy growth; in one year it arrives at its full height, which seldom exceeds 20 feet. The trunk is subligneous; the pith is large; the leaves broad and palmated; the flower spike is simple, and thickly set with yellow blossoms in the shape of a cone; the capsules are triangular and prickly, containing three smooth gray mottled seeds. When the bunches begin to turn black, they are gathered, dried in the sun, and the seeds picked out. They are afterwards put up for use as wanted, or for exportation.

Castor oil is obtained either by expression or by decoction. The first method is practised in England; the latter in Jamaica. It is common first to parch the nuts, or seeds in an iron pot over the fire; but this gives the oil an empyreumatic taste, smell, and colour; and it is best prepared in this manner: A large iron pot or boiler is first prepared, and half filled with water. The nuts are then beaten in parcels in deep wooden mortars, and after a quantity is beaten it is thrown into the iron vessel. The fire is then lighted, and the liquor is gently boiled for two hours, and kept constantly stirred. About this time the oil begins to separate, and swims on the top, mixed with a white froth, and is skimmed off till no more rise. The skimmings are heated in a small iron pot, and strained through a cloth. When cold, it is put up in jars or bottles for use.

Castor oil, thus made, is clear and well flavoured, and if put into proper bottles will keep sweet for years. The expressed castor oil soon turns rancid, because the mucilaginous and acrid parts of the nut are squeezed out with the oil. On this account the preference is given to well prepared oil by decoction. An English gallon of the seeds yields about two pounds of oil, which is a great proportion.

Before the disturbance in America, the planters imported train oil for lamps and other purposes about sugar works. It is now found that the castor oil can be procured as cheap as the fish oil of America; it burns clearer, and has not any offensive smell. This oil, too, is fit for all the purposes of the painter, or for the apothecary in ointments and plasters. As a medicine, it purges without stimulus, and is so mild as to be given to infants, soon after birth, to purge off the meconium. All oils are noxious to insects, but the castor oil kills and expels them. It is generally given as a purge after using the cabbage bark some days. In constipation and bellyach this oil is used with remarkable success. It fits well on the stomach, allays the spasm, and brings about a plentiful evacuation by stool, especially if at the same time fomentations, or the warm bath, are used. Bellyach is at present less frequent in Jamaica than formerly, owing to several causes. The inhabitants, in general, live better, and drink better liquors; but

the excessive drinking of new rum still makes it frequent amongst soldiers, sailors, and the lower order of white people. It has been known to happen too from visceral obstructions after intermittents, or marsh fevers, in Jamaica.

The ricinus Americanus grows as tall as a little tree, and is so beautiful that Millar says it deserves a place in every curious garden, and he planted it himself at Chelsea. It expands into many branches; the leaves are sometimes two feet in diameter, and the stem as large as a middle-sized broom staff; towards the top of the branch it has a cluster of flowers, something resembling a bunch of grapes; the flowers are small and staminate, but on the body of the plant grow bunches of rough triangular husks, each containing three speckled seeds, generally somewhat less than horse beans; the shell is brittle, and contains white kernels of a sweet, oily, and nauseous taste. From this kernel the oil is extracted, and if the medicine should become official, the seeds may be imported at a reasonable rate, as the plant grows wild and in great plenty in all the British and French American islands. See *Ozæon Palma Christi*. Of the ricinus communis there are a great many varieties; all of them fine majestic plants; annual, or at most biennial, in this country; but in their native soil they are said to be perennial both in root and stem. They are propagated by seeds sown on a hotbed, and require the same treatment as other tender exotics.

**RICKETS**, in medicine. See there, N° 344.  
**RICOCHET**, in gunnery, is when guns, howitzers, or mortars, are loaded with small charges, and elevated from 5 to 12 degrees, so as to fire over the parapet, and the shot or shell rolls along the opposite rampart: it is called *ricochet firing*, and the batteries are likewise called *ricochet batteries*. This method of firing was first invented by M. Belidor, and first used at the siege of Ath in 1697. This mode of firing and of mortars was first tried in 1723 at the military school at Strasbourg, and with success. At the battle of Rossbach, in 1757, the king of Prussia had several such mortars made with trunnions, and mounted on travelling carriages, which fired obliquely on the enemy's lines, and amongst their horse, loaded with a mixture of powder, and at an elevation of one degree 15 minutes, which did great execution; for the shells rolling along the lines, with burning fuzes, made the front of the enemy not wait for their burning.

**RICOTIA**, in botany: A genus of the filiquæ order, belonging to the tetradymia class of plants; and in the natural method ranking under the 39th order, *Sileneæ*. The filiquæ is anticlinal, oblong, and compressed, with plain valves.

**RIDGE**, in agriculture, a long piece of rising land between two furrows. See *AGRICULTURE*, N° 111.

**RIDDLING**, or **RINGEL**, among farmers, &c. the male of any beast that has been but half-gelt.

**RIDICULE**, in matters of literature, is that species of writing which excites contempt with laughter.

The *ridiculous*, however, differs from the *risible*, (see *RISIBLE*.) A risible object produceth an emotion of laughter merely: a ridiculous object is improper as well as risible; and produceth a mixed emotion, which is vented by a laugh of derision or scorn.

Burlesque, though a great engine of ridicule, is not confined to that subject; for it is clearly distinguishable into burlesque that excites laughter merely, and burlesque

Rickets ?  
Rid: ule.

**Ridicule.** burlesque that provokes derision or ridicule. A grave subject in which there is no impropriety, may be brought down by a certain colouring so as to be risible; which is the case of *Virgil Travestie*, and also the case of the *Secchia Rapita*; the authors laugh first, in order to make their readers laugh. The *Lutrin* is a burlesque poem of the other sort, laying hold of a low and trifling incident, to expose the luxury, indolence, and contentious spirit of a set of monks. Boileau, the author, gives a ridiculous air to the subject, by dressing it in the heroic style, and affecting to consider it as of the utmost dignity and importance. In a composition of this kind, no image professedly ludicrous ought to find quarter, because such images destroy the contrast; and accordingly the author shows always the grave face, and never once betrays a smile.

*Elements of Criticism.*

Though the burlesque that aims at ridiculous productions, its effects by elevating the style far above the subject, it has limits beyond which the elevation ought not to be carried: the poet, consulting the imagination of his readers, ought to confine himself to such images as are lively and readily apprehended: a strained elevation, soaring above an ordinary reach of fancy, makes not a pleasant impression: the reader, fatigued with being always upon the stretch, is soon disgusted; and like a performer, becomes thoughtless and indifferent. Farther, a fiction gives no pleasure unless it be painted in colours so lively as to produce some perception of reality; which never can be done effectually where the images are formed with labour or difficulty. For these reasons, we cannot avoid condemning the *Batrachomyomachia*, said to be the composition of Homer: it is beyond the power of imagination to form a clear and lively image of frogs and mice acting with the dignity of the highest of our species; nor can we form a conception of the reality of such an action, in any manner so distinct as to interest our affections even in the slightest degree.

The *Rape of the Lock* is of a character clearly distinguishable from those now mentioned; it is not properly a burlesque performance; but what may rather be termed a *satirical poem*: it treats a gay and familiar subject with pleasantry, and with a moderate degree of dignity; the author puts not on a mask like Boileau, nor professes to make us laugh like Tassoni. The *Rape of the Lock* is a genteel species of writing, less strained than those mentioned; and is pleasant or ludicrous without having ridicule for its chief aim; giving way, however, to ridicule where it arises naturally from a particular character, such as that of Sir Plume. Addison's *Spectator*\*, upon the exercise of the fan, is extremely gay and ludicrous, resembling in its subject the *Rape of the Lock*.

There remains to show, by examples, the manner of treating subjects so as to give them a ridiculous appearance.

Il ne dit jamais, je vous donne, mais, je vous prete le bon jour. *Moliere.*

*Orleans.* I know him to be valiant.

*Constable.* I was told that by one that knows him better than you.

*Orleans.* What's he?

*Constable.* Marry, he told me so himself; and he said, he car'd not who knew it. *Henry V. SHAKESPEARE.*

He never broke any man's head but his own, and that was against a post when he was drunk. *Ibid.*

*Millament.* Sententious Mirabel! prithee don't look with that violent and inflexible wife face, like Solomon at the dividing of the child in an old tapestry hanging. *Way of the World.*

A true critic, in the perusal of a book, is like a dog at a feast, whose thoughts and stomach are wholly set upon what the guests fling away, and consequently is apt to fast most when there are the fewest bones.

*Tale of a Tub.*

In the following instances, the ridicule arises from absurd conceptions in the persons introduced.

*Monsieur.* Te souvient-il, vicomte, de cette demeurée, que nous importames sur les ennemis au siege d'Afrique?

*Jodelet.* Que veux-tu dire avec ta demi-lue? c'etoit bien une lune tout entiere.

*Moliere, Les Precieuses Ridicules, sc. 11.*

*Slender.* I came yonder at Eaton to marry Mrs Anne Page; and she's a great lubberly boy.

*Page.* Upon my life then you took the wrong—

*Slender.* What need you tell me that? I think so when I took a boy for a girl: If I had been married to him, for all he was in woman's apparel, I would not have had him. *Merry Wives of Windsor.*

*Valentine.* Your blessing, Sir.

*Sir Sampson.* You've had it already, Sir: I think I sent it you to-day in a bill for four thousand pound; a great deal of money, brother Foresight.

*Foresight.* Ay, indeed, Sir Sampson, a great deal of money for a young man; I wonder what he can do with it. *Love for Love, Act II. sc. 7.*

*Millament.* I nauseate walking; 'tis a country diversion; I lothe the country, and every thing that relates to it.

*Sir Wifull.* Indeed, hah! look ye, look ye, you, do? nay, 'tis like you may—here are choice of pastimes here in town, as plays and the like; that must be confest'd, indeed.

*Millament.* Ah l'etourdie! I hate the town too.

*Sir Wifull.* Dear heart, that's much—hah! that you should hate 'em both! hah! 'tis like you may; there are some can't relish the town, and others can't away with the country—'tis like you may be one of these, Cousin. *Way of the World, Act IV. sc. 4.*

*Lord Froth.* I assure you, Sir Paul, I laugh at nobody's jests but my own, or a lady's: I assure you, Sir Paul.

*Bright.* How? how, my lord? what, affront my wit? Let me perish, do I never say any thing worthy to be laugh'd at?

*Lord Froth.* O foy, don't misapprehend me, I don't say so, for I often smile at your conceptions. But there is nothing more unbecoming a man of quality than to laugh; 'tis such a vulgar expression of the passions: every body can laugh. Then especially to laugh at the jest of an inferior person, or when any body elie of the same quality does not laugh with one; ridiculous! To be pleas'd with what pleases the crowd! Now, when I laugh I always laugh alone.

*Double Dealer, Act I. sc. 4.*

Ridicule.

So sharp-sighted is pride in blemishes, and so willing to be gratified, that it takes up with the very slightest improprieties: such as a blunder by a foreigner in speaking our language, especially if the blunder can bear a lenity that reflects on the speaker:

*Quickly.* The young man is an honest man.

*Caius.* What shall the honest man do in my closet? there is no honest man that shall come in my closet.

*Merry Wives of Windsor.*

Love speeches are finely ridiculed in the following passage:

Quoth he, My faith as adamantine,  
As chains of destiny, I'll maintain;  
True as Apollo ever spoke,  
Or oracle from heart of oak;  
And if you'll give my flame but vent,  
Now in close hugger-mugger pent,  
And shine upon me but benignly,  
With that one and that other pigfney,  
The sun and day shall sooner part  
Than love, or you, shake off my heart;  
The sun, that shall no more dispense  
His own, but your bright influence:  
I'll carve your name on barks of trees,  
With true-love knots and flourishes;  
That shall infuse eternal spring,  
And everlasting flourishing:  
Drink every letter on't in stum,  
And make it brisk champaign become.  
Where'er you tread, your foot shall set  
The primrose and the violet;  
All spices, perfumes, and sweet powders,  
Shall borrow from your breath their odours;  
Nature her charter shall renew  
And take all lives of things from you;  
The world depend upon your eye,  
And, when you frown upon it, die.  
Only our loves shall still survive,  
New worlds and natures to outlive;  
And, like to herald's moons, remain  
All crescents, without change or wane.

*Hudibras, Part II. Canto i.*

Those who have a talent for ridicule, which is seldom united with a taste for delicate and refined beauties, are quick-sighted in improprieties; and these they eagerly grasp, in order to gratify their favourite propensity. Persons galled are provoked to maintain that ridicule is improper for grave objects. Subjects really grave are by no means fit for ridicule; but then it is urged against them, that, when called in question whether a certain subject be really grave, ridicule is the only means of determining the controversy. Hence a celebrated question, Whether ridicule be or be not a test of truth?

On one side, it is observed, that the objects of ridicule are falsehood, incongruity, impropriety, or turpitude of certain kinds: but as the object of every excited passion must be examined by reason, before we can determine whether it be proper or improper; so ridicule must, apparently at least, establish the truth of the improprieties designed to excite the passion of contempt. Hence it comes into the aid of argument and reason, when its impressions on the imagination are consistent with the nature of things; but when it strikes the fancy

and affections with fictitious images, it becomes the instrument of deceit. But however ridicule may impress the idea of apparent turpitude or falsehood in the imagination, yet still reason remains the supreme judge; and thus ridicule can never be the final test or touchstone of truth and falsehood.

On the other side, it is contended that ridicule is not a subject of reasoning, but of sense or taste; (see and compare the articles *RISIBLE* and *CONGRUOUS* &c.) Stating the question, then, in more accurate terms, Whether the sense of ridicule be the proper test for distinguishing ridiculous objects from what are not so? they proceed thus: No person doubts that our sense of beauty is the true test of what is beautiful; and our sense of grandeur, of what is great or sublime. Is it more doubtful whether our sense of ridicule be the true test of what is ridiculous? It is not only the true test, but indeed the only test; for this subject comes not, more than beauty or grandeur, under the province of reason. If any subject, by the influence of fashion or custom, have acquired a degree of veneration to which naturally it is not entitled, what are the proper means for wiping off the artificial colouring, and displaying the subject in its true light? A man of true taste sees the subject without disguise; but if he hesitate, let him apply the test of ridicule, which separates it from its artificial connexions, and exposes it naked with all its native improprieties. But it is urged, that the gravest and most serious matters may be set in a ridiculous light. Hardly so; for where an object is neither risible nor improper, it lies not open in any quarter to an attack from ridicule.

**RIDING**, in general, signifies the being carried along on any vehicle.

**RIDING on horseback.** See *HORSEMANSHIP*.

**RIDING**, in medicine. During this exercise the viscera are shaken, and pressed against each other, at the same time the pure air acts with a greater force on the lungs. Weakly persons, or those whose stomachs are infirm, should, however, be cautious of riding before their meals are somewhat digested.

**RIDING**, in naval affairs, is the state of a ship being retained in a particular station, by means of one or more cables with their anchors, which are for this purpose sunk into the bottom of the sea, &c. in order to prevent the vessel from being driven at the mercy of the wind or current. A rope is said to *ride*, when one of the turns by which it is wound about the capstan or windlass lies over another, so as to interrupt the operation of heaving.

**Riding abwart**, the position of a ship which lies across the direction of the wind and tide, when the former is so strong as to prevent her from falling into the current of the latter.

**Riding between the Wind and Tide**, the situation of a vessel at anchor, when the wind and tide act upon her in direct opposition, in such a manner as to destroy the effort of each other upon her hull; so that she is in a manner balanced between their reciprocal force, and rides without the least strain on her cables. When a ship does not labour heavily, or feel a great strain when anchored in an open road or bay, she is said to ride easy. On the contrary, when she pitches violently into the sea, so as to strain her cables, masts, or hull, it is called *riding hard*, and the vessel is termed a *bad roader*.

**Riding, roader.** A ship is rarely said to *ride* when she is fastened at both the ends, as in a harbour or river, that situation being comprehended in the article **MOORING**.

**RIDING**, a district visited by an officer.—Yorkshire is divided into three ridings, viz. the east, west, and north ridings. In all indictments in that county, both the town and riding must be expressed.

**RIDING**, as connected with gardening, and susceptible of embellishment. See **GARDENING**.

*Observations  
on Modern  
Gardening,  
p. 227, &c.*

Decorations of a riding.

A riding, though in extent differing so widely from a garden, yet agrees with it in many particulars: for, exclusive of that community of character which results from their being both improvements, and both destined to pleasure, a closer relation arises from the property of a riding, to extend the idea of a seat, and appropriate a whole country to the mansion; for which purpose it must be distinguished from common roads, and the marks of distinction must be borrowed from a garden. Those which a farm or a park can supply are faint and few; but whenever circumstances belonging to a garden occur, they are immediately received as evidence of the domain. The species of the trees will often be decisive: plantations of fir, whether placed on the sides of the way, or in clumps or woods in the view, denote the neighbourhood of a seat: even hedges and hedges are less indifferent: for they have always been frequent in improvements, and rare in the ordinary scenes of cultivated nature. If the riding be carried through a wood, the shrubs, which for their beauty or their fragrance have been transplanted from the country into gardens, such as the sweet-briar, the viburnum, the camellia, and the wood-bine, should be encouraged in the underwood; and to these may be added several which are still peculiar to shrubberies, but which might easily be transferred to the wildest coverts, and would require no further care.

When the species are not, the disposition may be peculiar, and any appearance of design is a mark of improvement. A few trees standing out from a hedge, raise it to an elegance above common rusticity: and still more may be done by clumps in a field; they greet the air of a park. A close lane may be decorated with plantations in all the little vacant spaces: and even the groups originally on the spot (whether it be a wood, a field, or a lane), if properly selected, and those only left which are elegant, will have an effect: though every beauty of this kind may be found in nature; yet many of them are seldom seen together, and never combined. The number and the choice are symptoms of design.

Another symptom is variety. If the appendages of the riding be different in different fields, if in a lane, or a wood, some distinguishing circumstance be provided for every bend; or when, carried over an open exposure, it winds to several points of view; if this be the conduct throughout, the intention is evident, to amuse the length of the way: variety of ground is also a characteristic of a riding, when it seems to have proceeded from choice; and pleasure being the pursuit, the changes of the scene both compensate and account for the circuit.

But a part undistinguished from a common road, succeeding to others more adorned, will by the contrast alone be sometimes agreeable; and there are beauties frequent in the high-way, and almost peculiar to it,

which may be very acceptable in a riding: a green lane is always delightful; a passage winding between thickets of brambles and briars, sometimes with sometimes without a little spring-wood rising amongst them, or a cut in a continued sweep through the furze of a down or the fern of a heath, is generally pleasant. Nor will the character be absolutely lost in the interruption, it will soon be refamed, and never forgotten; when it has been once strongly impressed, very slight means will preserve the idea.

Simplicity may prevail the whole length of the way when the way is all naturally pleasant, but especially if it be a communication between several spots, which in character are raised above the rest of the country: A fine open grove is unusual, except in a park or a garden; it has an elegance in the disposition which cannot be attributed to accident, and it seems to require a degree of preservation beyond the care of mere husbandry. A neat railing on the edge of a steep which commands a prospect, alone distinguishes that from other points of view. A building is still more strongly characteristic: it may be only ornamental, or it may be accommodated to the reception of company; for though a place to alight at interrupts the range of a riding, yet, as the object of an airing, it may often be acceptable. A small spot which may be kept by the labour of one man, enclosed from the fields, and converted into a shrubbery or any other scene of a garden, will sometimes be a pleasing end to a short excursion from home: nothing so effectually extends the idea of a seat to a distance; and not being constantly visited, it will always retain the charms of novelty and variety.

When a riding is carried along a high road, a kind of a village of property may in appearance be claimed even there, by planting on both sides trees equidistant from each other, to give it the air of an approach: regularity intimates the neighbourhood of a mansion. A village therefore seems to be within the domain, if any of the inlets to it are avenues: other formal plantations about it, and still more trivial circumstances, when they are evidently ornamental, sometimes produce and always corroborate such an effect; but even without raising this idea, if the village be remarkable for its beauty, or only for its singularity, a passage through it may be an agreeable incident in a riding.

The same ground which in the fields is no more than rough, often seems to be romantic when it is the site of a village; the buildings and other circumstances mark and aggravate the irregularity. To strengthen this appearance, one cottage may be placed on the edge of a steep, and some winding steps of unhewn stone lead up to the door; another in a hollow, with all its little appurtenances hanging above it. The position of a few trees will sometimes answer the same purpose; a foot-bridge here and there for a communication between the sides of a narrow dip, will add to the character; and if there be any rills, they may be conducted so as greatly to improve it.

A village which has not these advantages of ground, may, however, be beautiful; it is distinguished by its elegance, when the larger intervals between the houses are filled with open groves, and little clumps are introduced upon other occasions. The church often is, it generally may be, made a picturesque object. Even the cottages may be neat and sometimes grouped with.

**Riding.** with thickets. If the place be watered by a stream, the crossings may be in a variety of pleasing designs; and if a spring rise, or only a well for common use be sunk by the side of the way, a little covering over it may be contrived, which shall at the same time be simple and pretty.

There are few villages which may not easily be rendered agreeable. A small alteration in the house will sometimes occasion a great difference in the appearance. By the help of a few trifling plantations, the objects which have a good effect may be brought in advantage, those which have not may be concealed, and such as are similar be disguised. A long fence, which offends the eye, whether of ground, or of buildings, may sometimes be broken by the slightest circumstances, by an advanced paling, or only by a bench. Variety and beauty, in such a subject, answer the effects of attention than expense.

3  
Of the  
buildings  
designed for  
objects in a  
riding.

But if the passage through the village cannot be pleasant; if the buildings are all alike, or stand in unmeaning rows and similar situations; if the place furnishes no opportunities to contrast the forms of dwellings with those of out-houses; to introduce trees and thickets; to interpose fields and meadows; to mix farms with cottages; and to place the several objects in different positions: yet on the outside even of such a village there certainly is room for wood; and by that alone the whole may be grouped into a mass, which shall be agreeable when skirted by a riding; and still more so when seen from a distance. The separate farms in the fields, also, by planting some trees about them, or perhaps only by managing those already on the spot, may be made very interesting objects; or if a new one is to be built, beauty may be consulted in the form of the house, and the disposition of its appurtenances. Sometimes a character not their own, as the semblance of a castle or an abbey, may be given to them; they will thereby acquire a degree of consideration; which they cannot otherwise be entitled to: and objects to improve the views are so important to a riding, that buildings must sometimes be erected for that purpose only: but they should be such as by an actual effect adorn or dignify the scene; not those little slight deceptions which are too well known to succeed, and have no merit if they fail: for though a fallacy sometimes contributes to support a character, or suggests ideas to the imagination, yet in itself it may be no improvement of a scene; and a bit of turret, the tip of a spire, and the other ordinary subjects of these frivolous attempts, are so insignificant as objects, that whether they are real or fictitious is almost a matter of indifference.

4  
Of a garden  
similar in  
character  
to a riding.

The same means by which the prospects from a riding are improved, may be applied to those from a garden; though they are not essential to its character, they are important to its beauty; and wherever they abound, the extent only of the range which commands them, determines whether they shall be seen from a riding or a garden. If they belong to the latter, that assumes in some degree the predominant properties of the former, and the two characters approach

very near to each other: but still each has its peculiarities. Progress is a prevailing idea in a riding; and the pleasantness of the way is, therefore, a principal consideration: but particular spots are more attended to in a garden; and to them the communications ought to be subordinate; their direction must be generally accommodated, their beauties sometimes sacrificed to the situation and the character of the scenes they lead to; an advantageous approach to these must be preferred to an agreeable line for the walk; and the circumstances which might otherwise become more misplaced, if they anticipate the openings, it should sometimes be contrived to them; be retired and dark if they are splendid or gay, and simple if they are richly adorned. At other times it may burst unexpectedly out upon them; not on account of the surprise, which excites its effect only at once; but the impressions are stronger by being sudden; and the contrast is enforced by the quickness of the transition.

In a riding, the scenes are only the amusements of the way, through which it proceeds without stopping: in a garden they are principal; and the subordination of the walk raises their importance. Every art, therefore, should be exerted to make them the objects of the place. Distant prospects cannot be long and the alienation does not offend us; we are familiarised to the extent forbids every thought of a closer comparison; and if a continuation be preserved between them and the points which command them, we are satisfied. But however we suggest other ideas; they appear to be within our reach: they are not only beautiful in prospect, and we can perceive that the spots are delightful; but we wish to examine, to inhabit, and to enjoy them. Every apparent impediment to that gratification is a disappointment; and when the scenes begin to open, the consequence of the place is lowered; something within it engages our notice: it is no collection only of beauties, the property of which does not belong to it; and that idea, though indistinct in a riding, which is but one passage, is very disagreeable to such a residence as a garden. To obviate such an idea, the points of view should be made important; the objects within be appendages to those without; the separations be removed or concealed; and large portions of the garden be annexed to the spots which are contiguous to it. The ideal boundary of the place is then carried beyond the scenes which are thus appropriated to it; and the wide circuit in which they lie, and the different positions in which they may be shown, afford a great variety than can generally be found in any garden, the scenery of which is confined to the enclosure.

**Riding.**

Perisfield (A) is not a large place; the park contains about 300 acres; and the house stands in the midst of it. On the side of the approach, the inequalities of the ground are gentle, and the plantations pretty; but nothing there is great. On the other side, a beautiful lawn falls precipitately every way into a deep vale which shelves down the middle; the declivities are diversified with clumps and with groves; and a number of large trees straggle along the bottom. This lawn is encompassed

5  
Description  
of Perisfield.

Riding.

passed with wood; and through the wood are walks, which open beyond it upon those romantic scenes which surround the park, and which are the glory of Persfield. The Wye runs immediately below the wood; the river is of a dirty colour; but the shape of its course is very various, winding first in the form of a horse-shoe, then proceeding in a large sweep to the town of Chepstowe, and afterwards to the Severn. The banks are high hills; in different places steep, bulging out, or hollow on the sides; rounded, flattened, or irregular at top; and covered with wood, or broken by rocks. They are sometimes seen in front; sometimes in perspective; falling back for the passage, or closing behind the bend, of the river; appearing to meet, rising above, or shooting out beyond one another. The wood which encloses the lawn covers an extensive range of these hills, which overlook all those on the opposite shore, with the country which appears above or between them; and within the folds of the river winds, thro' the sides, all rich and beautiful, are alternately exhibited; and the point which in one spot becomes an object to the next.

In many places the principal feature is a continued rock in a large quarter of a mile, perpendicular, high, and placed upon a height. To resemble ruins is common as to colour, but no ruin of any single structure was ever equal to this enormous pile; it seems to be the remains of a city; and other smaller heaps scattered about it appear to be fainter traces of the former extent, and strength of the fortification. It stretches along the river which terminates the forest of Dean; the base of it is composed of immense blocks of stone, but not so much as the top; it is bare and uneven, but not rugged; and from the top of it, a declivity, covered with a thick growth of grass, gently towards the Wye, but in one place, a steep, when all by a ledge of rocks, of a different sort, and in a different direction. From the summit it seems to rise, immediately over a thick growth of trees, down a hill behind the point of view, and then the valley through which the Wye flows, and up the opposite banks, hides the river, and continues to the bottom of the rock: from another part it is seen by itself without even its base; it rises another, with all its appendages about it, and sometimes the sight of it is partly intercepted by trees; beyond which, at a distance, its long line continues on through all the openings between them.

Another remarkable object is the castle of Chepstowe, a noble ruin of great extent; advanced to the very edge of a perpendicular rock, and so immediately rivetted to it, that from the top of the battlements down to the river seems but one precipice: the same ivy which overspreads the face of the one, twines and clusters among the fragments of the other; any towers, much of the walls, and large remains of the chapel, are standing. Close to it is a most romantic wooden bridge, very ancient, very grotesque, at an extraordinary height above the river, and seeming to abut against the ruins at one end, and some rocky hills at the other. The castle is so near to the alcove at Persfield, that little circumstances in it may be discerned; from other spots more distant, even from the lawn, and from a shrubbery on the side of the lawn, it is distinctly visible, and always beautiful, whether it is seen alone, or with the bridge, with the town, with more or with less of

the rich meadows which lie along the banks of the Wye, to its junction three miles off with the Severn. A long sweep of that river also, its red cliffs, and the fine rising country in the counties of Somerset and Gloucester, generally terminate the prospect.

Most of the hills about Persfield are full of rocks; some are intermixed with hanging woods, and either advance a little before them, or retire within them, and are tucked, or screened, or separated by trees. In the middle of the river, a long succession of them is frequently seen in perspective, all of a dark colour, and with woods in the intervals between them. In other parts the rocks are more wild and uncouth; and sometimes they stand on the tops of the highest hills; at other times down as low as the river; they are home-objects in one spot, and appear only in the back-ground of another.

The woods concur with the rocks to render the scenes of Persfield romantic: the place everywhere abounds with them; they cover the tops of the hills; they hang on the steep; or they fill the depths of the valleys. In one place they front, in another they rise above, in another they sink below the point of view; they are seen sometimes retiring beyond each other, and darkening as they recede; and sometimes an opening between two is closed by a third at a distance beyond them. A point, called the *Lover's Leap*, commands a continued surface of the thickest foliage, which overspreads a vast hollow immediately underneath. Below the Chinese seat the course of the Wye is in the shape of a horse-shoe: it is on one side enclosed by a semicircular hanging wood; the direct steep of a table hill shut it in on the other; and the great rock fills the interval between them: in the midst of this rude scene lies the peninsula formed by the river, a mile at the least in length, and in the highest state of cultivation: near the isthmus the ground rises considerably, and thence descends in a broken surface, till it flattens to the water's edge at the other extremity. The whole is divided into corn-fields and pastures; they are separated by hedgerows, coppices, and thickets; open clumps and single trees stand out in the meadows; and houses and other buildings, which belong to the farms, are scattered amongst them: nature so cultivated, surrounded by nature so wild, compose a most lovely landscape together.

The communications between these several points are generally by close walks; but the covert ends near the Chinese seat; and a path is afterwards conducted through the upper park to a rustic temple, which overlooks on one side some of the romantic views which have been described, and on the other the cultivated hills and valleys of Monmouthshire. To the rude and magnificent scenes of nature now succeeds a pleasant, fertile, and beautiful country, divided into enclosures, not covered with woods, nor broken by rocks and precipices, but only varied by easy swells and gentle declivities. Yet the prospect is not tame: the hills in it are high; and it is bounded by a vast sweep of the Severn, which is here visible for many miles together, and receives in its course the Wye and the Avon.

From the temple a road leads to the Windeliff, an eminence much above the rest, and commanding the whole in one view. The Wye runs at the foot of the hill; the peninsula lies just below; the deep bosom of

Ridley.

the semicircular hanging wood is full in sight; over part of it the great rock appears; all its base, all its accompaniments, are seen; the country immediately beyond it is full of lovely hillocks; and the higher grounds in the counties of Somerset and Gloucester rise in the horizon. The Severn seems to be, as it really is, above Chepstowe, three or four miles wide; below the town it spreads almost to a sea; the county of Monmouth is there the higher shore, and between its beautiful hills appear at a great distance the mountains of Brecknock and Glamorganshire. In extent, in variety, and grandeur, few prospects are equal to this. It comprehends all the noble scenes of Persia, encompassed by some of the finest country in Britain. See GARDENING.

RIDLEY (Nicholas), bishop of London, and martyr to the Reformation, was descended of an ancient family, and born in the beginning of the 16th century, at Wilmontwick in Northumberland. From the grammar-school at Newcastle upon Tyne, he was sent to Pembroke-hall in Cambridge, in the year 1518, where he was supported by his uncle Dr Robert Ridley, fellow of Queen's college. In 1522 he took his first degree in arts; two years after, was elected fellow; and, in 1525, he commenced master of arts. In 1527, having taken orders, he was sent by his uncle, for further improvement, to the Sorbonne at Paris; from thence he went to Louvain, and continued abroad till the year 1529. On his return to Cambridge, he was chosen under-treasurer of the university; and, in 1533, was elected senior proctor. He afterwards proceeded bachelor of divinity, and was chosen chaplain of the university, orator, and *magister glomerie*. At this time he was much admired as a preacher and disputant. He lost his kind uncle in 1536; but was soon after patronized by Dr Cranmer, archbishop of Canterbury, who made him his domestic chaplain, and presented him to the vicarage of Herne in East Kent; where, we are told, he preached the doctrine of the Reformation. In 1540, having commenced doctor of divinity, he was made king's chaplain; and, in the same year, was elected master of his college in Cambridge. Soon after, Ridley was collated to a prebend in the church of Canterbury; and it was not long before he was accused in the bishop's court, at the instigation of Bishop Gardiner, of preaching against the doctrine of the Six Articles. The matter being referred to Cranmer, Ridley was acquitted. In 1545, he was made a prebendary of Westminster abbey; in 1547 was presented, by the fellows of Pembroke-hall, to the living of Soham, in the diocese of Norwich; and the same year was consecrated bishop of Rochester. In 1550 he was translated to the see of London; in which year he was one of the commissioners for examining Bishop Gardiner, and concurred in his deprivation. In the year 1552, our prelate returning from Cambridge, unfortunately for himself, paid a visit to the Princess, afterwards Queen Mary; to whom, prompted by his zeal for reformation, he expressed himself with too much freedom; for she was scarcely seated on the throne when Ridley was doomed a victim to her revenge. With Cranmer and Latimer he was burnt alive at Oxford, on the 16th of October 1555. He wrote, 1. A Treatise concerning Images in Churches. 2. Brief Declaration of the Lord's Supper.

3. Certain Godly and Comfortable Conferences between Bishop Ridley and Mr Hugh Latimer, during their imprisonment. 4. A Comparison between the comfortable Doctrine of the Gospel and the Traditions of the Popish Religion; and other works.

RIFLE, in gunnery. See GUNNERY, N° 36, et seq.

RIGA, a large, strong, populous, and rich town of the Russian empire, and capital of Livonia. It is a large trading place, and has a very considerable fortress; the trade is chiefly in corn, skins, leather, and naval stores. It was taken by the Russians in 1710, after they had blocked it up a long while, during which the inhabitants were afflicted with the plague. The city is square, and defended by four towers and six bastions; besides which, it has a fine arsenal. The Protestants have still a handsome college here. It is seated on a large plain on the river Dwina. E. Long. 24° 31'. N. Lat. 57° 0'.

RIGADON, a gay and brisk dance, borrowed originally from Provence in France, and performed in figure by a man and woman.

RIGGING of a ship, a general name given to all the ropes employed to support the masts, and to extend or reduce the sails, or arrange them to the disposition of the wind. The former, which are used to sustain the masts, remain usually in a fixed position, and are called *standing rigging*; such are the *shrouds*, *lays*, and *back-lays*. The latter, whose office is to manage the sails, by communicating with various blocks or pulleys, situated in different places of the masts, yards, shrouds, &c. are comprehended in the general term of *running rigging*; such are the *braces*, *sheets*, *travellers*, *clue-lines*, *brails*, &c.

In rigging a mast, the first thing usually done is its head is a circular wreath or rope, called the *collar*, which is firmly beat down upon the top of the masts. The intent of this is to prevent the masts from being fretted or worn by the trestle-blocks on the shoulders of the mast; after this are laid on the two pendants, from whose lower ends the *main* or *top* tackles are suspended; and next, the shrouds of the starboard and larboard side, in pairs, alternately. The whole is covered by the *lays*, which are the largest ropes of the rigging. When a yard is to be rigged, a gromet is also driven first on each of its extremities; next to this are fitted on the *horses*, the *braces*, and lastly the *lifts* or *top-sail sheet-blocks*.

The principal objects to be considered in rigging a ship, appear to be strength, convenience, and simplicity; or, the properties of affording sufficient security to the masts, yards, and sails; of arranging the whole machinery in the most advantageous manner, to sustain the masts, and facilitate the management of the sails; and of avoiding perplexity, and rejecting whatever is superfluous or unnecessary. The perfection of this art, then, consists in retaining all those qualities, and preserving a judicious medium between them. See SHIP-BUILDING.

RIGHT, in geometry, signifies the same with straight; thus, a straight line is called a *right* one.

RIGHT is a title conferred, 1. Together with *Reverend*, upon all bishops. 2. Together with *Honourable*, upon earls, viscounts, and barons. 3. By courtesy, together with *Honourable*, upon the sons of dukes, marquises,

Rifle  
||  
Right.

Right. quises, and the eldest sons of earls. 4. Together with Honourable, to the speaker of the house of commons; but to no other commoner excepting those who are members of his majesty's most honourable privy council; and the three lord mayors of London, York, and Dublin, and the lord provost of Edinburgh, during their office. See HONOURABLE and PROVOST.

Hereditary RIGHT. See HEREDITARY.

1  
The term  
right ex-  
plained.

\* See Rec-  
titude.

RIGHT is a word which, in the propriety of the English language, is used sometimes as an adjective, and sometimes as a substantive. As an adjective it is nearly of the same import with *fit*, *suitable*, *becoming*, *proper*; and whilst it expresses a quality, it indicates a relation. Thus, when we say that an action is *right*, we must not only know the nature of the action, but, if we speak intelligibly, must also perceive its relation to the end for which it was performed; for an action may be *right* with one end in view which would be *wrong* with another. The conduct of that general would be *right*, who, to save an army that could not be otherwise saved, should place a small detachment in a station where he knew they would all be inevitably cut off; but his conduct would be *wrong* were he to throw away the life of a single individual for any purpose, however important, which he knew how to accomplish without such a sacrifice.

Most philosophers have talked of actions being *right* and *wrong* in the abstract, without regard to their natural consequences; and converting the word into a substantive, they have fancied an eternal rule of *right*, by which the morality of human conduct is in every particular case to be tried. But in these phrases we are altogether in the wrong. Whatever is *right* must be so in some particular case; and whatever is *fit*, must be so in some particular case. When he who rests the foundation of morality upon *some* law, speaks of an action being *right*, he must mean that it is such as, through the medium of this law, will excite complacency in the mind of the agent, and gain to him the general approbation of mankind. When he who rests moral obligation on the will of God, speaks of some actions as *right* and of others as *wrong*, he must mean that the former are agreeable to the divine will, however made known to men, and the latter disagreeable to it; and the man who deduces the laws of virtue from what he calls the *fitness of things*, must have *some end in view*, for which things are *fit*, and denominate actions *right* or *wrong* as they tend to promote or counteract that end.

But the word *right*, used as a substantive, has in common as well as in philosophical language a signification which at first view appears to be very different from this. It denotes a *just claim* or an *actual possession*. Thus we say, a father has a *right* to reverence from his children, a husband to the love and fidelity of his wife, and a king to the allegiance of his subjects. But if we trace these *rights* to their source, we shall find that they are all laws of moral obligation, and that they are called *rights* only because it is agreeable to the will of God, to the instinctive dictates of the moral sense, or to the fitness of things, if such a phrase has any meaning, that children reverence their parents, that wives love their husbands, and that subjects pay allegiance to their sovereign. This will be apparent to any man who shall put to himself such questions as these: *Why* have parents a *right* to reverence from their children, husbands to the love of

their wives, and sovereigns to the allegiance of their subjects? As these questions contain in them nothing absurd, it is obvious that they are each capable of a precise answer; but it is impossible to give to any of them an answer which shall have any meaning, and not imply that *right* and *obligation* are reciprocal, or, in other words, that *whenever there is a right in one person, there is a corresponding obligation upon others*. Thus to the question, "Why have parents a right to reverence from their children?" it may be answered, "because, under God, they were the authors of their children's being, and protected them from danger, and furnished them with necessaries, when they were in a state so helpless that they could do nothing for themselves." This answer conveys no other meaning than that there is an obligation upon children, in return for benefits received, to reverence their parents. But what is the source of this obligation? It can only be the will of God, the moral sense, or the fitness of things.

This view of the nature of right will enable us to form a proper judgment of the assertion of a late writer, "that man has no rights." The arguments by which this apparent paradox is maintained, are not merely ingenious and plausible; they are absolutely conclusive. But then our philosopher, who never chooses to travel in the beaten track, takes the word *right* in a sense very different from that in which it has been used by all other men, and considers it as equivalent to *discretionary power*. "By the word *right* (says he) is understood a full and complete power of either doing a thing or man, omitting it, without the person's becoming liable to animadversion or censure from another; that is, in other words, without his incurring any degree of turpitude or guilt." In this sense of the word he affirms, and affirms truly, that a man has no rights, no discretionary power whatever, except in things of such total indifference as, whether "he shall sit on the right or on the left side of his fire, or dine on beef to-day or to-morrow."

A proposition so evidently true as this stood not in need of argument to support it; but as his arguments are clearly expressed, and afford a complete confutation of some popular errors sanctioned by the respectable phrase *rights of man*, we shall give our readers an opportunity of studying them in his own words.

"Political society is founded on the principles of morality and justice. It is impossible for intellectual beings to be brought into coalition and intercourse without a certain mode of conduct, adapted to their nature and connexion, immediately becoming a duty incumbent on the parties concerned. Men would never have associated if they had not imagined that, in consequence of that association, they would mutually conduce to the advantage and happiness of each other. This is the real purpose, the genuine basis, of their intercourse; and, as far as this purpose is answered, so far does society answer the end of its institution. There is only one postulate more that is necessary to bring us to a conclusive mode of reasoning upon this subject. Whatever is meant by the term *right*, there can neither be opposite rights, nor rights and duties hostile to each other. The rights of one man cannot clash with or be destructive of the rights of another: for this, instead of rendering the subject an important branch of truth and morality as the advocates of the rights of man certain-

Right.

God's in  
Political  
Justice.

2  
Rights of  
man,

Right.

ly understand it to be, would be to reduce it to a heap of unintelligible jargon and inconsistency. If one man have a right to be free, another man cannot have a right to make him a slave; if one man have a right to inflict chastisement upon me, I cannot have a right to withdraw myself from chastisement; if my neighbour have a right to a sum of money in my possession, I cannot have a right to retain it in my pocket. It cannot be less incontrovertible, that I have no right to omit what my duty prescribes. From hence it inevitably follows that men have no rights.

"It is commonly said, 'that a man has a right to the disposal of his fortune, a right to the employment of his time, a right to the uncontrolled choice of his profession or pursuits.' But this can never be consistently affirmed till it can be shown that he has no duties, prescribing and limiting his mode of proceeding in all these respects.

"In reality, nothing can appear more wonderful to a careful inquirer, than that two ideas so incompatible as *man* and *rights* should ever have been associated together. Certain it is, that one of them must be utterly exclusive and annihilatory of the other. Before we ascribe rights to man, we must conceive of him as a being endowed with intellect, and capable of discerning the differences and tendencies of things. But a being endowed with intellect, and capable of discerning the differences and tendencies of things, instantly becomes a moral being, and has duties incumbent on him to discharge: and duties and rights, as has already been shown, are absolutely exclusive of each other.

"It has been affirmed by the zealous advocates of liberty, 'that princes and magistrates have no rights;' and no position can be more incontrovertible. There is no situation of their lives that has not its correspondent duties. There is no power intrusted to them that they are not bound to exercise exclusively for the public good. It is strange, that persons adopting this principle did not go a step farther, and perceive that the same restrictions were applicable to subjects and citizens."

Real and

This reasoning is unanswerable; but it militates not against the *rights of man* in the usual acceptance of the words, which are never employed to denote discretionary power, but a just claim on the one hand, implying a corresponding obligation on the other. Whether the phrase be absolutely proper is not worth the debating: it is authorized by custom—the *jus et norma loquendi*—and is universally understood except by such as the demons of faction, in the form of paradoxical writers on political justice, have been able to mislead by sophistical reasonings.

Various

*Rights*, in the common acceptance of the word, are of various kinds: they are *natural* or *adventitious*, *alienable* or *unalienable*, *perfect* or *imperfect*, *particular* or *general*. See the article *LIBERTY*.

Natural rights.

*Natural rights* are those which a man has to his life, limbs, and liberty; to the produce of his personal labour; to the use, in common with others, of air, light, and water, &c. That every man has a natural right or just claim to these things, is evident from their being absolutely necessary to enable him to answer that purpose, whatever it may be, for which he was made a living and rational being. This shows undeniably, that the Author of his nature designed that he should have the use of them, and that the man who should wanton-

ly deprive him of any one of them, would be guilty of a breach of the divine law, as well as act inconsistently with the fitness of things in every sense in which that phrase can possibly be understood.

Right.

*Adventitious rights* are those which a king has over his subjects, a general over his soldiers, a husband to the person and affections of his wife, and which every man has to the greater part of his property. That the rights of the king and the general are adventitious, is universally admitted. The rights of property have been considered elsewhere (see *PROPERTY*); and though the human constitution shows sufficiently that men and women have a natural right to the use of each other, yet it is evident that the *exclusive* right of any one man to any one woman, and *vice versa*, must be an adventitious right. But the important question is, How are adventitious rights acquired?

Adventitious.

In answer to this question, the moralist who deduces the laws of virtue from the will of God, observes, that as God appears from his works to be a benevolent Being, who wills the happiness of all his creatures (see *METAPHYSICS*, N° 312.), he must of course will every thing which naturally tends to promote that happiness. But the existence of civil society evidently contributes in a great degree to promote the sum of human happiness (see *SOCIETY*); and therefore whatever is necessary for the support of civil society in general, or for the conduct of particular societies already established, must be agreeable to the will of God; that the allegiance of subjects to their sovereign, the obedience of soldiers to their leader, the protection of private property, and the fulfilling of contracts, are absolutely necessary to the support of society; and hence the right of kings, generals, husbands, &c. &c. though adventitious, and immediately derived from a man appointment, are not less sacred than natural rights, since they may all be ultimately traced to the same source. The same conclusion may easily be drawn by the philosopher, who rests moral obligation on the fitness of things or on a moral sense: only it must in each of these cases partake of the instability of its foundation.

How acquired.

To the sacredness of the rights of marriage, an author already quoted has lately urged some declamatory objections. "It is absurd (says he) to expect, that the inclinations and wishes of two human beings should coincide through any long period of time. To oblige them to act and to live together, is to subject them to some inevitable portion of thwarting, bickering, and unhappiness. This cannot be otherwise, so long as man has failed to reach the standard of absolute perfection. The supposition that I must have a companion for life, is the result of a complication of vices. It is the dictate of cowardice, and not of fortitude. It flows from the desire of being loved and esteemed for something that is not desert."

Objections to some of these rights.

"But the evil of marriage, as it is practised in European countries, lies deeper than this. The habit is, for a thoughtless and romantic youth of each sex to come together, to see each other for a few times, and under circumstances full of delusion, and then to vow to each other eternal attachment. What is the consequence of this? In almost every instance they find themselves deceived. They are reduced to make the best of an irretrievable mistake. They are presented with the strongest imaginable temptation to become the dupes of

Right.

of falsehood. They are led to conceive it their wisest policy to shut their eyes upon realities; happy if by any perversion of intellect they can persuade themselves that they were right in their first crude opinion of their companion.

"So long as two human beings are forbidden by positive institution to follow the dictates of their own mind, prejudice is alive and vigorous. So long as I seek to engross one woman to myself, and to prohibit my neighbour from proving his superior desert and reaping the fruits of it, I am guilty of the most odious of all monopolies. Over this imaginary prize men watch with perpetual jealousy; and one man will find his desires and his capacity to circumvent as much excited, as the other is excited to traverse his projects and frustrate his hopes. As long as this state of society continues, philanthropy will be crossed and checked in a thousand ways, and the still augmenting stream of abuse will continue to flow.

"The abolition of marriage will be attended with no evils. The intercourse of the sexes will fall under the same system as any other species of friendship. Exclusively of all groundless and obstinate attachments, it will be impossible for me to live in the world without finding one man of a worth superior to that of any other man, and an opportunity of observing. To this man I shall owe a kindness in exact proportion to my appreciation of his worth. The case will be precisely the same with respect to the female sex. I shall abundantly estimate the intercourse of that woman whose accomplishments shall strike me in the most powerful manner. But it may happen that other men will feel for her the same preference that I do. This will create no difficulty. We may all enjoy her conversation. We shall all be wise enough to consider the woman as the object of a very trivial object. This, like every other case in which two persons are concerned, will be regulated in each successive instance by the unobtrusive consent of either party. It is a mark of the extravagance of our present habits, that we are inclined to suppose the sensual intercourse anywise material to the advantages arising from the purest affection. Reasonable men now eat and drink, not from the love of pleasure, but because eating and drinking are essential to our healthful existence. Reasonable men then will propagate their species, not because a certain sensible pleasure is annexed to this action, but because it is right the species should be propagated; and the manner in which they exercise this function will be regulated by the dictates of reason and duty.

9  
Obviated.

It is right then, according to this political innovator, that the species should be propagated, and reasonable men in his Utopian commonwealth would be incited by reason and duty to propagate them: but the way to fulfil this duty, experience, which is seldom at one with speculative reformation, has already demonstrated, not to consist in the promiscuous intercourse of several men with one woman, but in the fidelity of individuals of the two sexes to each other. Common prostitutes among us seldom prove with child; and the society of *Arrecoys* in Otaheitee, who have completely divested themselves of what our author calls *prejudice*, and are by no means guilty of his *most odious of all monopolies*, are for the most part childless (see *OTAHEITEE*). He seems to think that a state of equal property would ne-

cessarily destroy our relish for luxury, decrease our inordinate appetites of every kind, and lead us universally to prefer the pleasures of intellect to the pleasures of sense. But here again experience is against him. The *Arrecoys*, who have a property in their women perfectly equal, are the most luxurious and sensual wretches on the face of the earth; sensual indeed to a degree of which the most libidinous European can hardly form a conception.

By admitting it to be a duty to propagate the species, our author must necessarily grant that every thing is right which is requisite to the fulfilling of that duty, and the contrary wrong. If so, promiscuous concubinage is wrong, since we have seen, that by a law of nature it is incompatible with the duty; whence it follows on his own principles, that the sexual union by pairs must be right. The only question therefore to be decided between him and his opponents is, "Whether should that union be temporary or permanent?" And we think the following observations by Mr Paley sufficient to decide it to the conviction of every person not blinded by the rage of innovation.

"A lawgiver, whose counsels were directed by views of general utility, and obstructed by no local impediments, would make the marriage contract indissoluble during the joint lives of the parties, for the sake of the following advantages: Such a union tends to preserve peace and concord between married persons, by perpetuating their common interest, and by inducing a necessity of mutual compliance. An earlier termination of it would produce a separate interest. The wife would naturally look forward to the dissolution of the partnership, and endeavour to draw to herself a fund against the time when she was no longer to have access to the same resources. This would beget peculation on one side, and mistrust on the other; evils which at present very little disturb the confidence of married life. The second effect of making the union determinable only by death, is not less beneficial. It necessarily happens, that adverse tempers, habits, and tastes, oftentimes meet in marriage. In which case, each party must take pains to give up what offends, and practise what may gratify, the other. A man and woman in love with each other do this insensibly: but love is neither general nor durable; and where that is wanting, no lessons of duty, no delicacy of sentiment, will go half so far with the generality of mankind and woman kind as this one intelligible reflection, that they must each make the best of their bargain; and that seeing they must either both be miserable or both share in the same happiness, neither can find their own comfort but in promoting the pleasure of the other. These compliances, though at first extorted by necessity, become in time easy and mutual, and though less endearing than affluities which take their rise from affection, generally procure to the married pair a repose and satisfaction sufficient for their happiness."

So differently from our author does this judicious writer reason concerning the effects of a permanent union on the tempers of the married pair. Instead of subjecting them to some inevitable portion of thwarting, bickering, and unhappiness, it lays them, in his opinion, under the necessity of curbing their unruly passions, and acquiring habits of gentleness, forbearance, and peace. To this we may add, that both believing

Right.

the

Right. the children propagated during their marriage to be their own (a belief unattainable by the father in a state of promiscuous concubinage), they come by natural process of the human passions (see PASSION) to love each other through the medium of their offspring. But if it be the duty of man to acquire a spirit first pure, then peaceable, gentle, and easy to be entreated, it must be agreeable to the will of God, and a branch of the fitness of things, that the sexual union last during the joint lives of the parties; and therefore the exclusive right of marriage, though adventitious, must be equally sacred with those which are natural.

TO  
Rights alienable  
and unalienable;

But to return from this digression, into which the importance of the subject led us, *rights*, besides being natural or adventitious, are likewise *alienable* or *unalienable*. Every man when he becomes the member of a civil community, alienates a part of his natural rights. In a state of nature, no man has a superior on earth, and each has a right to defend his life, liberty, and property, by all the means which nature has put in his power. In civil society however, these rights are all transferred to the laws and the magistrate, except in cases of such extreme urgency as leave not time for legal interposition. This single consideration is sufficient to show, that the right to civil liberty is alienable; though in the vehemence of man's zeal for it, and in the language of some political remonstrances, it has often been pronounced to be an unalienable right. "The true reason (says Mr Paley) why mankind hold in detestation the memory of those who have sold their liberty to a tyrant is, that, together with their own, they sold commonly or endangered the liberty of others; of which they had certainly no right to dispose." The rights of a prince over his people, and of a husband over his wife, are generally and naturally unalienable.

IT  
Perfect and imperfect.

Another division of rights is those which are perfect and those which are imperfect. Perfect rights are such as may be precisely ascertained and asserted by force or in civil society by the course of law. To imperfect rights neither force nor law is applicable. A man's rights to his life, person, and property, are all perfect; for if any of those be attacked, he may repel the attack by instant violence, punish the aggressor by the course of law, or compel the author of the injury to make restitution or satisfaction. A woman's right to her honour is likewise perfect; for if she cannot otherwise escape, she may kill the ravisher. Every poor man has undoubted right to relief from the rich; but his right is imperfect, for if the relief be not voluntarily given, he cannot compel it either by law or by violence. There is no duty upon which the Christian religion puts a greater value than alms-giving: and every preacher of the gospel has an undoubted right to inculcate the practice of it upon his audience: but even this right is imperfect, for he cannot refuse the communion to a man merely on account of his illiberality to the poor, as he can to another for the neglect of any duty comprehended under the term justice. In elections or appointments to offices where the qualifications are prescribed, the best qualified candidate has unquestionably a right to success; yet if he be rejected, he can neither seize the office by force, nor obtain redress at law. His right therefore, is imperfect.

Here a question naturally offers itself to our consideration. "How comes a person to have a right to a thing

and yet have no right to use the means necessary to obtain it?" The answer is, That in such cases the object or the circumstances of the right are so indeterminate, that the permission of force, even where the right is real and certain, would lead to force in other cases where there exists no right at all. Thus, though the poor man has a right to relief, who shall ascertain the mode, season, and quantum of it, or the person by whom it shall be administered? These things must be ascertained before the right to relief can be enforced by law; but to allow them to be ascertained by the poor themselves, would be to expose property to endless claims. In like manner, the comparative qualifications of the candidate must be ascertained, before he can enforce his right to the office; but to allow him to ascertain his qualifications himself, would be to make him judge in his own cause between himself and his neighbour.

Right

Wherever the right is imperfect on one side, the corresponding obligation on the other must be imperfect likewise. The violation of it, however, is often not less criminal in a moral and religious view than of a perfect obligation. It is well observed by Mr Paley, that greater is guilt incurred by disappointing a worthy candidate of a place upon which perhaps his livelihood depends, and in which he could eminently serve the public, than by filching a book out of a library, or picking a pocket of a handkerchief. The same sentiment has been expressed by Mr Godwin, but in terms by much too strong, and such as show that he was not at the time complete master of his subject. "My neighbour (says he) has just as much right to put an end to my existence, with dagger or poison, as to deny me that pecuniary assistance without which I must starve, or as to deny me that assistance without which my intellectual attainments, or my moral exertions, will be materially injured. He has just as much right to amuse himself with burning my house, or torturing my children upon the rack, as to shut himself up in a cell, careless about his fellow men, and to hide "his talents in a napkin."

It is certainly true that the man who should suffer another to starve for want of that relief which he knew that he alone could afford him, would be guilty of murder, and murder of the cruellest kind: but there is an immense difference between depriving society of one of its members, and withholding from that member what might be necessary to enable him to make the greatest possible intellectual attainments. Newton might have been useful and happy though he had never been acquainted with the elements of mathematics; and the late celebrated Mr Ferguson might have been a valuable member of society, though he had never emerged from his original condition of a shepherd. The remainder of the paragraph is too absurd to require a formal confutation. Had our author, burying his talent in a napkin, shut himself up seven years ago in a cell, careless about his fellow men and *political justice*, he would have deprived the public of what he doubtless believes to be much useful instruction; but had he at that period amused himself with burning his neighbour's house, and torturing on the rack two or three children, he would have cut off, for any thing he could know, two, or three future Newtons, and have himself been cut off by the insulted laws of his country. Now, without supposing the value

Right,  
Righteous-  
ness.

13  
Rights par-  
ticular and  
general.

of ten Newtons to be equal to that of one Godwin, we are warranted to say, that however great his merits may be, they are not infinite, and that the addition of those of one Newton to them would undoubtedly increase their sum.

*Rights*, are particular or general. Particular rights are such as belong to certain individuals or orders of men, and not to others. The rights of kings, of masters, of husbands, of wives, and, in short, all the rights which originate in society, are particular. General rights are those which belong to the species collectively. Such are our rights to the vegetable produce of the earth, and to the flesh of animals for food; but about the origin of this latter right there has been much diversity of opinion, which we have noticed in another place. (See THEOLOGY, Part I. sect. 2.) If the vegetable produce of the earth be included under the general rights of mankind, it is plain that he is guilty of wrong who leaves any considerable portion of land waste merely for his own amusement; he is lessening the common stock of provisions which Providence intended to distribute among the species. On this principle it would not be easy to vindicate certain regulations respecting game, as well as some other monopolies which are protected by the municipal laws of most countries. Mr Paine, by just reasoning, has established this conclusion, "that nothing ought to be made exclusive property which can be conveniently enjoyed in common." An equal division of land, however, the dream of some visionary reformers, would be injurious to the general rights of mankind, as it may be demonstrated, that it would lessen the common stock of provisions, by laying every man under the necessity of being his own weaver, tailor, shoemaker, smith, and carpenter, as well as miller, and baker. Among the general rights of mankind is the right of necessity; by which a man may use or destroy his neighbour's property when it is absolutely necessary for his own preservation. It is on this principle that goods are thrown overboard to save the ship, and houses pulled down to stop the progress of a fire. In such cases, however, at least in the last, retribution ought to be made when it is in our power: but this retribution will not extend to the original value of the property destroyed, but only to what it was worth at the time of destroying it, which, considering its danger, might be very little.

Rights of  
necessity.

**RIGHTEOUSNESS**, means justice, honesty, virtue, goodness; and amongst Christians is of exactly the same import with holiness, without which, we are told, no man shall see the Lord. The doctrine of the fall, and of redemption through Jesus Christ, has occasioned much disputation, and given rise to many singular notions in the world. The haughty philosopher, dissatisfied with mysteries, and with the humiliating doctrine of atonement by a crucified Saviour, has made a religion for himself, which he calls *rational Christianity*; and the enthusiast, by extracting doctrines from Scripture which are not contained in it, and which are repugnant to its spirit, has given too much countenance to this presumption. The doctrine of imputed righteousness, by which the merit of Christ is said to be imputed to us, appears to be of this number; and though it has been held by many good, and by some learned men, it is certainly in general unfriendly to virtue, as will be readily allowed by all who have conversed with the more ignorant sort of Methodists in England or Se-

ceders in Scotland. That it does not follow from the doctrine of the atonement, and consequently that it has no foundation in Scripture, will appear elsewhere. See THEOLOGY.

*Bill of Rights*, in law, is a declaration delivered by the lords and commons to the prince and princess of Orange, 13th February 1688, and afterwards enacted in parliament, when they became king and queen. It sets forth, that King James did, by the assistance of divers evil counsellors, endeavour to subvert the laws and liberties of this kingdom, by exercising a power of dispensing with, and suspending the laws; by levying money for the use of the crown by pretence of prerogative without consent of parliament; by prosecuting those who petitioned the king, and discouraging petitions; by raising and keeping a standing army in time of peace; by violating the freedom of election of members to serve in parliament; by violent prosecutions in the court of king's bench; and causing partial and corrupt jurors to be returned on trials, excessive bail to be taken, excessive fines to be imposed, and cruel punishments inflicted; all which were declared to be illegal. And the declaration concludes in these remarkable words: "And they do claim, demand, and insist upon, all and singular the premises, as their undoubted rights and liberties." And the act of parliament itself (1 W. & M. stat. 2. cap. 2.) recognizes "all and singular the rights and liberties, asserted and claimed in the said declaration, to be the true, ancient, indubitable rights of the people of this kingdom." See LIBERTY.

Rights  
||  
Rigoll.

**RIGIDITY**, in physics, denotes a brittle hardness. It is opposed to ductility, malleability, and softness.

**RIGOLL**, or **RIGALS**, a kind of musical instrument, consisting of several sticks bound together, only separated by beads. It is tolerably harmonious, being well struck with a ball at the end of a stick. Such is the account which Grassineau gives of this instrument. Skinner, upon the authority of an old English dictionary, represents it as a clavichord, or clavicord; possibly founding his opinion on the nature of the office of the tuner of the regals, who still subsists in the establishment of the king's chapel at St James's, and whose business is to keep the organ of the chapel royal in tune; and not knowing that such wind instruments as the organ need frequent tuning, as well as the clavichord and other stringed instruments. Sir Henry Spelman derives the word *rigoll* from the Italian *regabello*, a musical instrument, anciently used in churches instead of the organ. Walther, in his description of the regal, makes it to be a reed-work in an organ, with metal and also wooden pipes and bellows adapted to it. And he adds, that the name of it is supposed to be owing to its having been presented by the inventor to some king.—From an account of the regal used in Germany, and other parts of Europe, it appears to consist of pipes and keys on one side, and the bellows and wind-chest on the other. We may add, that Lord Bacon (Nat. Hist. cent. ii. §. 102.) distinguishes between the regal and organ, in a manner which shows them to be instruments of the same class. Upon the whole, there is reason to conclude, that the regal or rigoll was a pneumatic, and not a stringed instrument.

Merfennus relates, that the Flemings invented an instrument, *les regals de bois*, consisting of 17 cylindrical

Rigor  
|  
Rings.

pieces of wood, decreasing gradually in length, so as to produce a succession of tones and semitones in the diatonic series, which had keys, and was played on as a spinet; the hint of which, he says, was taken from an instrument in use among the Turks, consisting of 13 wooden cylinders, of different lengths, strung together, which being suspended and struck with a stick, having a ball at the end, produced music. *Hawkin's Hist. Mus.* Vol. II. p. 449.

**RIGOR**, in medicine, a convulsive shivering from severe cold, an ague fit, or other disorder.

**RIMINI**, an ancient, populous, and handsome town of Italy, in Romagna, which is part of the territory of the church, with a bishop's see, an old castle, and a strong tower; as also many remains of antiquity, and very fine buildings. It is famous for a council in 1339, consisting of 400 bishops, who were all Arises except 20. It is seated in a fertile plain, at the mouth of the river Marecchia, on the gulf of Venice. *E. Long.* 12. 39. N. Lat. 44. 6.

**RIND**, the skin of any fruit that may be cut off or pared. Rind is also used for the inner bark of trees, or that whitish soft substance which adheres immediately to the wood. See **PLANT**.

**RING**, an ornament of gold or silver, of a circular figure, and usually worn on the finger.

The episcopal ring (which makes a part of the pontifical apparatus, and is esteemed a pledge of the spiritual marriage between the bishop and his church) is of very ancient standing. The fourth council of Toledo, held in 633, appoints, that a bishop condemned by one council, and found afterwards innocent by a second, shall be restored, by giving him the ring, staff, &c. From bishops, the custom of the ring has passed to cardinals, who are to pay a very great sum *pro jure annuli cardinalitii*.

**RINGS**. The antiquity of rings is known from Scripture and profane authors. Judah left his ring or signet with Tamar (*Gen.* xxxviii. 18.) When Pharaoh committed the government of all Egypt to Joseph, he took his ring from his finger, and gave it to Joseph (*Gen.* xli. 42.) After the victory that the Israelites obtained over the Midianites, they offered to the Lord the rings, the bracelets, and the golden necklaces, and the ear-rings, that they had taken from the enemy (*Numb.* xxxi. 50.) The Israelitish women wore rings not only on their fingers, but also in their nostrils and their ears. St James distinguishes a man of wealth and dignity by the ring of gold that he wore on his finger (*James* ii. 2.) At the return of the prodigal son, his father orders him to be dressed in a new suit of clothes, and to have a ring put upon his finger (*Luke* xv. 22.) When the Lord threatened King Jeconiah with the utmost effects of his anger, he tells him, that though he wore the signet or ring upon his finger, yet he should be torn off (*Jer.* xxii. 24.)

The ring was used chiefly to seal with; and the Scripture generally puts it in the hands of princes and great persons; as the king of Egypt, Joseph, Ahaz, Jeezabel, King Ahasuerus, his favourite Haman, Mordecai, who succeeded Haman in his dignity, King Darius (*1 Kings* xxi. 8; *Ezra* iii. 10, &c.; *Dan.* vi. 17.) The patents and orders of these princes were sealed with their rings or signets; and it was this that secured to them their authority and respect. See the article **SEAL**.

**RING-BONE**. See **FARRIERY**, sect. xxxi.

**RING-DUJEL**, in ornithology, a species of **TUARDUS**.

**RIO-GRANDE**, a river of Africa, which runs from east to west through Negroland, and falls into the Atlantic ocean, in 11 degrees of latitude. Some take it to be a branch of the Niger, of which there is not the least proof.

**Rio-Grande**, a river of South America, in Brasil, which has its source in an unknown country: it crosses the captainship of Rio-Grande, and falls into the sea at Natal los Reyes.

**Rio-Janeiro**, a river of South America, which rises in the mountains west of Brasil, and running east through that country, falls into the Atlantic ocean, in S. Lat. 23. 30. The province of Janeiro is one of the richest in Brasil; and produces gold, silver, diamonds, and other precious stones.

**RIOU**, a town of France, in Auvergne; seated on a hill, in a fertile country, that it is called the garden of Auvergne. *E. Long.* 2. 12. N. Lat. 45. 54.

**RIOT**, in law. The riotous assembling of 12 persons, or more, and not dissolving upon proclamation, was first made high treason by statute 1 Edw. VI. c. 5. when the king was a minor, and a change of religion to be effected: but that statute was repealed by statute 1 Mar. c. 2. among the other statutes passed since the 23. Edw. III.; though the prohibition was in substance re-enacted, with an inferior degree of punishment, by statute 1 Mar. R. 2. c. 13. which made the same offence a single felony. These statutes specified and particularized the nature of the riot that was meant to suppress; as, for example, such a riot as was foot with intention to offer violence to the pope, council, or to change the laws of the kingdom, or for certain other specific purposes; in which case the persons were commanded by proclamation to disperse, and they did not, it was by the statute made felony, but within the benefit of clergy; and also the act indemnified the peace-officers and assistants, if they killed any of the rioters in order to suppress such riot. This was thought necessary security in that sanguinary reign, when slavery was intended to be re-established, which was like to produce great discontent: but at first it was made only for a year, and was afterwards continued for that queen's life. And by statute 1 Eliz. c. 16. when a reformation in religion was to be more attempted, it was revived and continued during her life also, and then expired. From the accession of James I. to the death of Queen Anne, it was never once thought expedient to revive it; but, in the first year of George I. it was judged necessary, in order to support the execution of the act of settlement, to renew it, and at one stroke to make it perpetual, with large additions. For, whereas the former acts expressly defined and specified what should be accounted a riot, the statute 1 Geo. I. c. 5. enacts, generally, that if any 12 persons are unlawfully assembled, to the disturbance of the peace, and any one justice of the peace, sheriff, under-sheriff, or mayor of a town, shall think proper to command them by proclamation to disperse, if they contemn his orders and continue together for one hour afterwards, such contempt shall be felony without benefit of clergy. And farther, if the reading of the proclamation be by force opposed, or the reader be in any manner wilfully hindered

Riot.

Riphæan  
Risible.

his light shrivelled grain will go much farther in feed than the plump grain would do. I saw the experiment made on wheat which was so shrivelled that it was thought scarcely worth giving to fowls, and yet produced heavy large ears."

RIPHÆAN MOUNTAINS, are a chain of high mountains in Russia, to the north-east of the river Oby, where there are said to be the finest fables of the whole empire.

RIPHATH, or RIPHAT, second son of Gomer, and grandson of Japhet (Gen. x. 3. רִפְחַת *Riphat*). In most copies he is called *Diphath* in the Chronicles (1 Chr. i. 6. דִּיפְחַת *Diphat*.) The resemblance of the two Hebrew letters *Resh* and *Daleth* is so much, that they are very often confounded. But, to the credit of the translators of our English version be it said, that in this instance, as well as in many others, they have restored the original reading, and rendered it Riphath. The learned are not agreed about the country that was peopled by the descendants of Riphath. The Chaldee and Arabic take it for France; Eusebius for the country of the Sauromatæ; the Chronicon Alexandrinum for that of the Garamantæ; Josephus for Paphlagonia. Mela assures us, that anciently the people of this province were called *Riphatai*, or Riphaces; and in Bithysia, bordering upon Paphlagonia, may be found the river Rhebus, a people called *Rhebantes*, and a canton of the same name. These reasons have prevailed with Bochart to believe, that Riphath peopled Paphlagonia. Others think he peopled the Montes Riphæi; and this opinion seems the most reasonable to us, because the other sons of Gomer peopled the northern countries towards Scythia, and beyond the Euxine sea.

RISIBLE, any thing capable of exciting laughter.

*Ludicrous* is a general term, signifying, as may appear from its derivation, what is playfome, sportive, or jocular. *Ludicrous* therefore seems the genus, of which *risible* is a species, limited as above to what makes us laugh.

However easy it may be, concerning any particular object, to say whether it be risible or not, it seems difficult, if at all practicable, to establish any general character, by which objects of that kind may be distinguished from others. Nor is that a singular case; for, upon a review, we find the same difficulty in most of the articles already handled. There is nothing more easy, viewing a particular object, than to pronounce that it is beautiful or ugly, grand or little: but were we to attempt general rules for ranging objects under different classes according to these qualities, we should be much gravelled. A separate cause increases the difficulty of distinguishing risible objects by a general character: all men are not equally affected by risible objects, nor the same man at all times; for in high spirits a thing will make him laugh outright, which will scarce provoke a smile in a grave mood. Risible objects, however, are circumscribed within certain limits. No object is risible but what appears slight, little, or trivial; for we laugh at nothing that is of importance to our own interest or to that of others. A real distress raises pity, and therefore cannot be risible; but a slight or imaginary distress, which moves not pity, is risible. The adventure of the fulling-mills in Don Quixote, is extremely risible; so is the scene where Sancho, in a dark night, tumbling into a pit, and at-

taching himself to the side by hand and foot, hangs there in terrible dismay till the morning, when he discovers himself to be within a foot of the bottom. A nose remarkably long or short, is risible; but to want it altogether, so far from provoking laughter, raises horror in the spectator. With respect to works both of nature and of art, none of them are risible but what are out of rule; some remarkable defect or excess, a very long visage, for example, or a very short one. Hence nothing just, proper, decent, beautiful, proportioned, or grand, is risible.

Even from this slight sketch it will be readily conjectured, that the emotion raised by a risible object is of a nature so singular, as scarce to find place while the mind is occupied with any other passion or emotion; and the conjecture is verified by experience; for we scarce ever find that emotion blended with any other. One emotion we must except; and that is, contempt raised by certain improprieties: every improper act inspires us with some degree of contempt for the author; and if an improper act be at the same time risible, to provoke laughter, of which blunders and absurdities are noted instances, the two emotions of contempt and of laughter unite in the mind, and produce externally what is termed a laugh of derision or of scorn. Hence objects that excite laughter may be distinguished into two kinds: they are either risible or ridiculous. A risible object is mirthful only; a ridiculous object is both mirthful and contemptible. The first raises an emotion of laughter that is altogether pleasant: the pleasant emotion of laughter raised by the other, is blended with the painful emotion of contempt; and the mixed emotion is termed the emotion of ridicule. The pain a ridiculous object gives is repented and punished by a laugh of derision. A risible object, on the other hand, gives us no pain: it is altogether pleasant by a certain sort of illustration, which is expressed externally by mirthful laughter. See RIDICULE.

Risible objects are so common, and so well understood, that it is unnecessary to consume paper or time upon them. Take the few following examples:

*Falstaff.* I do remember him at Clement's inn, like a man made after supper of a cheese-paring. When he was naked, he was for all the world like a forked radish, with a head fantastically carved upon it with a knife.

*Second part, Henry IV. Act. III. Sc. 5.* The foregoing is of disproportion. The following examples are of slight or imaginary misfortunes.

*Falstaff.* Go fetch me a quart of sack, put a toast in't. Have I liv'd to be carried in a basket, like a barrow of butcher's offal, and to be thrown into the Thames! Well, if I be served such another trick, I'll have my brains ta'en out and buttered, and give them to a dog for a new-year's gift. The rogues slighted me into the river with as little remorse as they would have drown'd a bitch's blind puppies, fifteen p'ith'liter; and you may know by my size that I have a kind of alacrity in sinking; if the bottom were as deep as hell, I should drown. I had been drown'd, but that the shore was shelvy and shallow; a death that I abhor: for the water swells a man; and what a thing should I have been when I had been swell'd? I should have been a mountain of mummy.

*Merry Wives of Windsor, Act. III. Sc. 15.*  
*Falstaff.*

Riddle  
River.

*Falstaff.* Nay, you shall hear, Master Brook, what I have suffer'd to bring this woman to evil for your good. Being thus cramm'd in the basket, a couple of Ford's knaves, his hinds, were call'd forth by their mistress, to carry me in the name of foul clothes to Datchet-lane. They took me on their shoulders, met the jealous knave their master in the door, who ask'd them once or twice what they had in their basket. I quak'd for fear, lest the lunatic knave would have search'd it; but Fate, ordaining he should be a one-kold, held his hand. Well, on went he for a search, and away went I for foul clothes. But mark the sequel, Master Brook. I suffer'd the pangs of three egregious deaths: first, an intolerable fright, to be detected by a jealous rotten bell-weather; next, to be compass'd like a good bilbo, in the circumference of a peck, hilt to point, heel to head; and then to be stopt in, like a strong distillation, with stinking clothes that fetted in their own grease. Think of that, a man of my kidney; think of that, that am so subject to heat as butter; a man of continual distillation and thaw: it was a miracle to escape suffocation. And in the hottest of this bath, when I was more than half dead, I was, like a Dutch dish, to be thrown into the gutter, and soot'd glowing hot, in that surge, like a Dutch dish; think of that; hissing hot; think of that, Mr Brook.

*Merry Wives of Windsor, A.C. III. Sc. 17.*

**RITE**, among divines, denotes the particular manner of celebrating divine service in this or that country.

**RITORNELLO**, or **REFRAT**, in music, the burden of a song, or the repetition of the first or other verses of a song at the end of each couplet.

**RITTERHUSIUS** (Conrad), a learned German civilian, born at Brunswick in 1560. He was professor of civil law at Altdorf, and published a variety of works, particularly as a civilian; together with an edition of Oppian in Greek and Latin: he was moreover an excellent critic; his notes upon many eminent authors having been inserted in the best editions of them. He died in 1613.

**RITUAL**, a book directing the order and manner to be observed in performing divine service in a particular church, diocese, or the like. The ancient heathens had also their rituals, which contained their rites and ceremonies to be observed in building a city, consecrating a temple or altar, in sacrificing, and deifying, in dividing the curiae, tribes, centuries, and in general, in all their religious ceremonies. There are several passages in Cato's books, *De Re Rustica*, which may give us some idea of the rituals of the ancients.

**RIVAL**, a term applied to two or more persons who have the same pretensions; and which is properly applied to a competitor in love, and figuratively to an antagonist in any other pursuit.

Rite  
River.

## R I V E R,

**Definition.** Is a course of fresh water, flowing in a Bed or Channel, towards its source to the sea.

A river is distinguished to a considerable collection of waters, formed by the conflux of two or more Brooks, which deliver into its channel the united streams of several Rivulets, which have collected the supplies of many Falls trickling down from numberless springs, and the torrents which carry off from them the sloping grounds the surplus of every shower.

Utility of  
rivers.

Rivers form one of the chief features of the surface of this globe, serving as voiders of all that is immediately redundant in our rains and springs, and also as boundaries and barriers, and even as highways, and in many countries as plentiful storehouses. They also fertilize our soil by laying upon our warm fields the richest mould, brought from the high mountains, where it would have remained useless for want of genial heat.

Origin of  
their  
names.

Being such interesting objects of attention, every branch acquires a proper name, and the whole acquires a sort of personal identity, of which it is frequently difficult to find the principle; for the name of the great body of waters which discharges itself into the sea is traced backwards to one of the sources, while all the contributing streams are lost, although their waters form the chief part of the collection. And sometimes the feeder in which the name is preserved is smaller than others which are united to the current, and which like a rich but ignoble alliance lose their name in that of the more illustrious family. Some rivers indeed are respectable even at their birth, coming at once in force from some great lake. Such is the Rio de la Plata, the river St Lawrence, and the mighty streams which issue in all directions from the Baical lake. But,

like the sons of Adam, they are all of equal descent, and should take their name from one of the feeders of these lakes. This is indeed the case with a few, such as the Rhone, the Rhine, the Nile. These, after having mixed their waters with those of the lake, resume their appearance and their name at its outlet.

But in general their origin and progress, and even the features of their character, bear some resemblance (as has been prettily observed by Pliny) to the life of man. The river springs from the earth; but its origin is in heaven. Its beginnings are insignificant, and its infancy is frivolous; it plays among the flowers of a meadow; it waters a garden, or turns a little mill. Gathering strength in its youth, it becomes wild and impetuous. Impatient of the restraints which it still meets with in the hollows among the mountains, it is restless and fretful; quick in its turnings, and unsteady in its course. Now it is a roaring cataract, tearing up and overturning whatever opposes its progress, and it shoots headlong down from a rock; then it becomes a sullen and gloomy pool, buried in the bottom of a glen. Recovering breath by repose, it again dashes along, till tired of the uproar and mischief, it quits all that it has swept along, and leaves the opening of the valley strewed with the rejected waste. Now, quitting its retirement, it comes abroad into the world, journeying with more prudence and discretion through cultivated fields, yielding to circumstances, and winding round what would trouble it to overwhelm or remove. It passes through the populous cities and all the busy haunts of man, tendering its services on every side, and becomes the support and ornament of the country. Now increased by numerous alliances, and advanced

*History.* in its course of existence, it becomes grave and stately in its motions, loves peace and quiet; and in majestic silence rolls on its mighty waters, till it is laid to rest in the vast abyss.

*5* The religious respect for rivers. The philosopher, the real lover of wisdom, sees much to admire in the economy and mechanism of running waters; and there are few operations of nature which give him more opportunities of remarking the nice adjustment of the most simple means for attaining many purposes of most extensive beneficence. All mankind seem to have felt this. The heart of man is ever open (unless perverted by the habits of selfish indulgence and arrogant self-conceit) to impressions of gratitude and love. He who ascribes the religious principle (debased, though it be by the humbling abuses of superstition) to the workings of fear alone, may betray the slavish meanness of his own mind, but gives a very unfair and a false picture of the hearts of his neighbours. Lucretius was but half a philosopher when he penned his oft-quoted apophthegm. Indeed his own invocations show how much the animal was blended with the sage.

*6* The effect of gratitude and affection. We apprehend, that whoever will read with an honest and candid mind, unbiassed by licentious wishes, the accounts of the ancient superstitions, will acknowledge that the amiable emotions of the human soul have had their share in creating the numerous divinities whose worship filled up their kalenders. The sun and the host of heaven have in all ages and nations been the objects of a sincere worship. Next to them, the rivers seem to have attracted the grateful acknowledgments of the inhabitants of the adjacent countries. They have everywhere been considered as a sort of tutelar divinities; and each little district, every retired valley, had its river god, who was preferred to all others with a partial fondness. The expostulation of Naaman the Syrian, who was offended with the prophet for enjoining him to wash in the river Jordan, was the natural effusion of this attachment. "What! (said he), are not Abana and Pharpar, rivers of Damascus, more excellent than all the waters of Judæa? Might I not wash in them and be clean? So he went away wroth."

In those countries particularly, where the rural labours, and the hopes of the shepherd and the husbandman, were not so immediately connected with the approach and recess of the sun, and depended rather on what happened in a far distant country by the falls of periodical rains or the melting of collected snows, the Nile, the Ganges, the Indus, the river of Pegu, were the sensible agents of nature in procuring to the inhabitants of their fertile banks all their abundance, and they became the objects of grateful veneration. Their sources were sought out with anxious care even by conquering princes; and when found, were universally worshipped with the most affectionate devotion. These remarkable rivers, so eminently and so palpably beneficent, preserve to this day, amidst every change of habit, and every increase of civilization and improvement, the fond adoration of the inhabitants of those fruitful countries through which they hold their stately course, and their waters are still held sacred. No progress of artificial refinement, not all the corruption of luxurious sensuality, has been able to eradicate this plant of native growth from the heart of man. The sentiment is

*History.* congenial to his nature, and therefore it is universal; and we could almost appeal to the feelings of every reader, whether he does not perceive it in his own breast. Perhaps we may be mistaken in our opinion in the case of the corrupted inhabitants of the populous and busy cities, who are habituated to the fond contemplation of their own individual exertions as the sources of all their hopes. Give the shoemaker but leather and a few tools, and he defies the powers of nature to disappoint him; but the simpler inhabitants of the country, the most worthy and the most respectable part of every nation, after equal, perhaps greater exertion both of skill and of industry, are more accustomed to resign themselves to the great ministers of Providence, and to look up to heaven for the "early and the later rains," without which all their labours are fruitless.

*Non sumus quidam pro illis*

*Non sumus quidam pro illis*

And among the husbandmen and the shepherds of all nations and ages, we find the same fond attachment to their springs and rivulets.

*Fortunate sentis, hic inter fontina nota*

*Et fontes sacros fons caputis apertum* was the mournful ejaculation of poor *Bliss*. We hardly know a river of any note in our own country whose source is not looked on with some respect.

We repeat our assertion, that this worship was the offspring of affection and gratitude, and that it is giving a very unfair and false picture of the human mind to ascribe these superstitions to the working of fear alone. These would have represented the river-gods as seated on ruins, brandishing rooted-up trees, with angry looks, pouring out their sweeping torrents. But in such thing. The lively imagination of the Greeks felt, and expressed with an energy unknown to all other nations, every emotion of the human soul. They figured the Naiads as beautiful nymphs, patterns of gentleness and of elegance. They are represented as partially attached to the children of men; and their interference in human affairs is always in acts of kind assistance and protection. They resemble, in this respect, the rural deities of the northern nations, the fairies, but without their caprices and resentments. And, if we attend to the descriptions and representations of their River-Gods, being armed with power, an attribute which slavish fear never fails to couple with cruelty and vengeance, we find the same expression of affectionate trust and confidence in their kind dispositions. They are generally called by the respectable but endearing name of *father*. "*Da Tyberi pater*," says Virgil. Mr Bower says that the Nile at its source is called the *abay* or "*father*." We observe this word, or its radix, blended with many names of rivers of the east; and think it probable that when our traveller got this name from the inhabitants of the neighbourhood, they applied to the stream what is meant to express the tutelar or presiding spirit. The river-gods are always represented as venerable old men, to indicate their being coeval with the world. But it is always a *cruda viridisque senectus*, and they are never represented as oppressed with age and decrepitude. Their beards are long and flowing, their looks placid, their attitude easy, reclined on a bank, covered, as they are crowned, with never-fading sedges and bulrushes, and leaning on their urns, from which they pour out their plentiful and fertilizing streams.—

Mr

**History.** Mr Bruce's description of the sources of the Nile, and of the respect paid to the sacred waters, has not a frowning feature: and the hospitable old man, with his fair daughter Irepone, and the gentle priesthood which peopled the little village of Geesh, form a contrast with the neighbouring Galla (among whom a military leader was called the *lamb*, because he did not murder pregnant women), which very distinctly paints the inspiring principle of this superstition. Pliny says (VIII. 8.) that at the source of the Clitumnus there is an ancient temple highly respected. The presence and the power of the divinity are expressed by the fates which stand in the vestibule.—Around this temple are several little chapels, each of which covers a sacred fountain; for the Clitumnus is the father of several little rivers which unite their streams with him. At some distance below the temple is a bridge which divides the sacred waters from those which are open to common use. No one must presume to set his foot in the stream above this bridge; and to step over any of them is an indignity which renders a person infamous. They can only be visited in a consecrated boat. Below the bridge we are permitted to bathe, and the place is immediately occupied by the neighbouring village. *Strabo de Italia Signif. Orbis*, p. 101—103. and 105. also *Sutton. Caligula*, c. 43. *Virg. Georg.* II. 486.

What is the cause of all this? The Clitumnus flows (near its source) through the richest pastures, through which its waters are carefully distributed by numberless drains; and these nourished cattle of such spotless whiteness and extraordinary beauty, that they were sought for with eagerness over all Italy, as the most acceptable victims in their sacrifices. Is not this superstition then an effect of gratitude?

Such are the dictates of kind-hearted nature in our hearts; before it has been vitiated by vanity and self-conceit, and we should not be ashamed of feeling the superstition. We hardly think of making any apology for dwelling a little on this incidental circumstance of the superstitious veneration paid to rivers. We cannot think that our readers will be displeased at having agreeable ideas excited in their minds, being always of opinion that the torch of true philosophy will not only enlighten the understanding, but also warm and cherish the affections of the heart.

Origin of rivers.

With respect to the origin of rivers, we have very little to offer in this place. It is obvious to every person, that besides the torrents which carry down into the rivers what part of the rains and melted snow is not absorbed by the soil or taken up by the plants which cover the earth, they are fed either immediately or remotely by the springs. A few remarkable streams rush at once out of the earth in force, and must be considered as the continuation of subterraneous rivers, whose origin we are therefore to seek out; and we do not know any circumstance in which their first beginnings differ from those of other rivers, which are formed by the union of little streams and rills, each of which has its own source in a spring or fountain. This question, therefore, What is the process of nature, and what are the supplies which fill our springs? will be treated of under the word *Spring*.

Whatever be the source of rivers, it is to be met with in almost every part of the globe. The crust of

earth with which the rocky framing of this globe is covered is generally stratified. Some of these strata are extremely pervious to water, having but small attraction for its particles, and being very porous. Such is the quality of gravelly strata in an eminent degree. Other strata are much more firm, or attract water more strongly, and refuse it a passage. This is the case with firm rock and with clay. When a stratum of the first kind has one of the other immediately under it, the water remains in the upper stratum, and bursts out wherever the sloping sides of the hills cut off the strata; and this will be in the form of a trickling spring, because the water in the porous stratum is greatly obstructed in its passage towards the outlet. As this irregular formation of the earth is very general, we must have springs, and of course rivers or rivulets, in every corner where there are high grounds.

Rivers flow from the higher to the low grounds. It is the arrangement of this elevation which distributes them over the surface of the earth. And this appears to be accomplished with considerable regularity; and, except the great desert of Kobi on the confines of Chinese Tartary, we do not remember any very extensive track of ground that is deprived of those channels for voiding the superfluous waters; and even there they are far from being redundant.

The course of rivers give us the best general method for judging of the elevation of a country. Thus it appears that Savoy and Switzerland are the highest grounds of Europe, from whence the ground slopes in every direction. From the Alps proceed the Danube and the Rhine, whose courses mark the two great valleys, into which many lateral streams descend. The Po also and the Rhone come from the same head, and with a steeper and shorter course find their way to the sea through valleys of less breadth and length. On the west side of the valleys of the Rhine and the Rhone the ground rises pretty fast, so that few tributary streams come into them from that side; and from this gentle elevation France slopes to the westward. If a line, nearly straight, but bending a little to the northward, be drawn from the head of Savoy and Switzerland all the way to Solikamskoy in Siberia, it will nearly pass through the most elevated part of Europe; for in this track most of the rivers have their rise. On the left go off the various feeders of the Elbe, the Oder, the Wesel, the Niemen, the Duna, the Neva, the Dwina, the Petzora. On the right, after passing the feeders of the Danube, we see the sources of the Sereth and Pruth, the Dniester, the Bog, the Dniester, the Don, and the mighty Volga. The elevation, however, is extremely moderate; and it appears from the levels taken with the barometer by the Abbé Chappe d'Auteroche, that the head of the Volga is not more than 470 feet above the surface of the ocean. And we may observe here by the by, that its mouth, where it discharges its waters into the Caspian sea, is undoubtedly lower, by many feet, than the surface of the ocean. See *PNEUMATICS*, N° 277. Spain and Finland, with Lapland, Norway, and Sweden, form two detached parts, which have little symmetry with the rest of Europe.

A chain of mountains begins in Nova Zembla, and stretches due south to near the Caspian sea, dividing Europe from Asia. About three or four degrees north of

History.

8

They flow from the higher to the lower grounds.

9

Course of the rivers of Europe;

10

of

History.

of the Caspian sea it bends to the south-east, traverses Western Tartary, and passing between the Tengis and Zaizan lakes, it then branches to the east and south. The eastern branch runs to the shores of Korea and Kamtscharka. The southern branch traverses Turkestan and Thibet, separating them from India, and at the head of the kingdom of Ava joins an arm stretching from the great eastern branch, and here forms the centre of a very singular radiation. Chains of mountains issue from it in every direction. Three or four of them keep very close together, dividing the continent into narrow slips, which have each a great river flowing in the middle, and reaching to the extreme points of Malacca, Cambodia, and Cochinchina. From the same central point proceeds another great ridge due east, and passes a little north of Canton in China. We called this a singular centre: for though it sends off so many branches, it is by no means the most elevated part of the continent. In the triangle which is included between the first southern ridge (which comes from between the lakes Tengis and Zaizan), the great eastern ridge, and its branch which almost unites with the southern ridge, lies Boutan, and part of Tibet, and the many little rivers which occupy its surface, flow southward and eastward, uniting a little to the north of the centre often mentioned, and then pass through a gorge eastward into China. And it is farther to be observed, that these great ridges do not appear to be seated on the highest parts of the country; for the rivers which correspond to them are at no great distance from them, and receive their chief supplies from the other sides. This is remarkably the case with the great Oby, which runs almost parallel to the ridge from the lakes to Nova Zembla. It receives its supplies from the east, and indeed it has its source far east. The highest grounds (if we except the ridges of mountains which are boundaries) of the continent seem to be in the country of the Calmucs, about 95° east from London, and latitude 43° or 45° north. It is represented as a fine though sandy country, having many little rivers which lose themselves in the sand, or end in little salt lakes. This elevation stretches north-east to a great distance; and in this tract we find the heads of the Irtysh, Selenga, and Tungulkaia (the great feeders of the Oby), the Olenitz, the Lena, the Yana, and some other rivers which all go off to the north. On the other side we have the great river Amur, and many smaller rivers, whose names are not familiar. The Hoangho, the great river of China, rises on the south side of the great eastern ridge we have so often mentioned. This elevation, which is a continuation of the former, is somewhat of the same complexion, being very sandy, and at present is a desert of prodigious extent. It is described, however, as interspersed with vast tracts of rich pasture; and we know that it was formerly the residence of a great nation, who came south, by the name of *Turks*, and possessed themselves of most of the richest kingdoms of Asia. In the south-western extremity of this country are found remains not only of barbaric magnificence, but even of cultivation and elegance. It was a profitable privilege granted by Peter the Great to some adventurers to search these sandy deserts for remains of former opulence, and many pieces of delicate workmanship (though not in a style which we would admire) in gold and sil-

ver were found. Vaults were found buried in the sand filled with written papers, in a character wholly unknown; and a wall was discovered extending several miles, built with hewn stone, and ornamented with cornice and battlements. But we are forgetting ourselves, and return to the consideration of the distribution of the rivers on the surface of the earth. A great ridge of mountains begins at the south-east corner of the Euxine sea, and proceeds eastward, ranging along the south side of the Caspian, and still advancing unites with the mountains first mentioned in Thibet, sending off some branches to the south, which divide Persia, India and Thibet. From the south side of this ridge flow the Euphrates, Tigris, Indus, Ganges, &c. and from the north the ancient Oxus and many unknown streams.

There is a remarkable circumstance in this quarter of the globe. Although it seems to be nearest to the greatest elevations, it seems also to have places of the greatest depression. We have already said that the Caspian sea is lower than the ocean. There is in its neighbourhood another great basin of salt water, the lake Aral, which receives the waters of the Oxus or Gihon, which were said to have formerly run into the Caspian sea. There cannot therefore be a great difference in the level of these two basins; neither have they any outlet, though they receive great rivers. There is another great lake in the very middle of Persia, the Zare or Zera, which receives the river Hindemend, of near 250 miles length, besides other streams. There is another such in Asia Minor. The sea of Sodom and Gomorrah is another instance. And in the high countries we mentioned, there are many small salt lakes, which receive little rivers, and have no outlet. The lake Zera in Persia, however, is the only one which indicates a considerable hollow of the country. It is now ascertained by actual survey, that the sea of Sodom is considerably higher than the Mediterranean. This feature is not, however, peculiar to Asia. It obtains also in Africa, whose rivers we now proceed to mention.

Of them, however, we know very little. The Nile indeed is perhaps better known than any river out of Europe; and of its source and progress we have given a full account in a separate article. See NILE.

By the register of the weather kept by Mr Bruce at Gondar in 1770 and 1771, it appears that the greatest rains are about the beginning of July. He says that at an average each month after June it doubles its rains. The calish or canal is opened at Cairo about the 9th of August, when the river has risen 14 pecks (each 11 inches), and the waters begin to decrease about the 10th of September. Hence we may form a conjecture concerning the time which the water employs in coming from Abyssinia. Mr Bruce supposes it 9 days, which supposes a velocity not less than 14 feet in a second; a thing past belief, and inconsistent with all our notions. The general slope of the river is greatly diminished by several great cataracts; and Mr Bruce expressly says, that he might have come down from Sennaar to the cataracts of Syene in a boat, and that it is navigable for boats far above Sennaar. He came from Syene to Cairo by water. We apprehend that no boat would venture down a stream moving even six feet in a second, and none could row up if the velocity was three feet. As the waters begin to decrease about the 10th of

History.

of Africa.

September

History.

September, we must conclude that the water then flowing past Cairo had left Abyssinia when the rains had greatly abated. Judging in this way, we must still allow the stream a velocity of more than six feet. Had the first swell at Cairo been noticed in 1770 or 1771, we might have guessed better. The year that Thevenot was in Egypt, the first swell of 8 pecks was observed Jan. 28. The calish was opened for 14 pecks on August 14th, and the waters began to decrease on September 23d, having risen to  $21\frac{1}{2}$  pecks. We may suppose a similar progress at Cairo corresponding to Mr Bruce's observations at Gondar, and date every thing five days earlier.

We understand that some of our gentlemen stationed far up the Ganges have had the curiosity to take notes of the swellings of that river, and compare them with the overflowings at Calcutta; and that their observations are about to be made public. Such accounts are valuable additions to our practical knowledge, and we shall not neglect to insert the information in some kindred article of this work.

The same mountains which attract the tropical vapours, and produce the fertilising inundations of the Nile, perform the same office to the famous Niger, which, as we have often been accounted fabulous, and whose course we have very little acquaintance. The remarks of the gentlemen of the African association render its existence no longer doubtful, and have greatly excited the public curiosity. For a farther account of its track, see NIGRA.

From the great number, and the very moderate size, of the rivers which fall into the Atlantic ocean all the way down the coast of the Gambia, we conclude that the western shore is the most elevated, and that the mountains are at no great distance inland. On the other hand, the rivers at Meliada and Sofala are of a magnitude which indicate a much longer course. But of all this we speak with much uncertainty.

12  
and of A-  
merica.

The frame-work (so to call it) of America is better known, and is singular.

A chain of mountains begins, or at least is found, in longitude  $110^\circ$  west of London, and latitude  $40^\circ$  north, on the northern confines of the kingdom of Mexico, and stretching southward through that kingdom, forms the ridge of the neck of land which separates North from South America, and keeping almost close to the shore, ranges along the whole western coast of South America, terminating at Cape Horn. In its course it sends off branches, which, after separating from it for a few leagues, rejoin it again, enclosing valleys of great extent from north to south, and of prodigious elevation. In one of these, under the equatorial sun, stands the city of Quito, in the midst of extensive fields of barley, oats, wheat, and gardens, containing apples, pears, and gooseberries, and in short all the grains and fruits of the cooler parts of Europe; and although the vine is also there in perfection, the olive is wanting. Not a dozen miles from it in the low countries, the sugar-cane, the indigo, and all the fruits of the torrid zone, find their congenial heat, and the inhabitants swelter under a burning sun. At as small a distance on the other hand tower aloft the pinacles of Pichincha, Corambourou, and Chemboracao, crowned with never-melting snows.

The individual mountains of this stupendous range not only exceed in height all others in the world (if

History.

we except the Peak of Teneriffe, Mount Etna, and Mount Blanc); but they are set down on a base incomparably more elevated than any other country. They cut off therefore all communication between the Pacific ocean and the inland continent; and no rivers are to be found on the west coast of South America which have any considerable length of course or body of waters. The country is drained, like Africa, in the opposite direction. Not 100 miles from the city of Lima, the capital of Peru, which lies almost on the sea shore, and just at the foot of the high Cordilleras, arises out of a small lake the Maragnon or Amazon's river, which, after running northward for about 100 miles, takes an easterly direction, and crosses nearly the broadest part of South America, and falls into the great western ocean at Para, after a course of not less than 3500 miles. In the half of its descent it receives a few middle-sized rivers from the north, and from the south it receives the great river Combos, springing from another little lake not 50 miles distant from the head of the Maragnon, and enclosing between them a wide extent of country. Then it receives the Yuta, the Yuerva, the Cuchivara, and Parana Mire, each of which is equal to the Rhine; and then the Madeira, which has flowed above 1300 miles. At their junction the breadth is so great, that neither shore can be seen by a person standing up in a canoe; so that the united stream must be about 6 miles broad. In this majestic form it rolls along at a prodigious rate through a flat country, covered with impenetrable forests, and most of it as yet untrodden by human feet. M. Condamine, who came down the stream, says, that all is silent as the desert, and the wild beasts and numberless birds crowd round the boat, eyeing it as some animal of which they did not seem afraid. The bed was cut deep through an equal and yielding soil, which seemed rich in every part, if he could judge by the vegetation, which was rank in the extreme. What an addition this to the possible population of this globe! A narrow slip along each bank of this mighty river would equal in surface the whole of Europe, and would probably exceed it in general fertility: and although the velocity in the main stream was great, he observed that it was extremely moderate, nay almost still at the sides; so that in those parts where the country was inhabited by men, the Indians paddled up the river with perfect ease. Boats could go from Para to near the mouth of the Madeira in 38 days which is near 1200 miles.

Mr Condamine made an observation during his passage down the Maragnon, which is extremely curious and instructive, although it puzzled him very much. He observed that the tide was sensible at a vast distance from the mouth: It was very considerable at the junction of the Madeira; and he supposes that it might have been observed much farther up. This appeared to him very surprising, because there could be no doubt but that the surface of the water there was higher by a great many feet than the surface of the flood of the Atlantic ocean at the mouth of the river. It was therefore very natural for him to ascribe the tide in the Maragnon to the immediate action of the moon on its waters; and this explanation was the more reasonable, because the river extends in the direction of terrestrial longitude, which by the Newtonian theory is most favourable to the production of a tide. Journeying as he

History.

did in an Indian canoe, we cannot suppose that he had much leisure or convenience for calculation, and therefore are not surprised that he did not see that even this circumstance was of little avail in so small or shallow a body of water. He carefully noted, however, the times of high and low water as he passed along. When arrived at Para, he found not only that the high water was later and later as we are farther from the mouth, but he found that at one and the same instant there were several points of high water between Para and the confluence of the Madeira, with points of low water intervening. This conclusion was easily drawn from his own observations, although he could not see at one instant the high waters in different places. He had only to compute the time of high water at a particular spot, on the day he observed it at another; allowing, as usual, for the moon's change of position. The result of his observations therefore was, that the surface of the river was not an inclined plane whose slope was lessened by the tide of flood at the mouth of the river, but that it was a waving line, and that the propagation of the tide up the river was nothing different from the propagation of any other wave. We may conceive it clearly, though imperfectly, in this way. Let the place be noted where the tide happens 12 hours later than at the mouth of the river. It is evident that there is also a tide at the very mouth at the same instant; and, since the ocean tide had withdrawn itself during the time that the former tide had proceeded so far up the river, and the tide of ebb is successively felt above as well as the tide of flood, there must be a low water between these two high waters.

Newton had pointed out this curious fact, and observed that the tide at London bridge, which is 43 feet above the sea, is not the same with that at Gravesend, but the preceding tide (See *Phil. Trans.* 67.) This will be more particularly insisted on in another place.

Not far from the head of the Maragnon, the Cordilleras send off a branch to the north-east, which reaches and ranges along the shore of the Mexican gulf, and the Rio Grande de Sta Martha occupies the angle between the ridges.

Another ridge ranges with interruptions along the east coast of Terra Firma, so that the whole waters of this country are collected into the Oronoko. In like manner the north and east of Brazil are hemmed in by mountainous ridges, through which there is no considerable passage; and the ground sloping backwards, all the waters of this immense tract are collected from both sides by many considerable rivers into the great river Paraguay, or Rio de la Plata, which runs down the middle of this country for more than 1400 miles, and falls into the sea through a vast mouth in latitude 35°.

Thus the whole of South America seems as if it had been formerly surrounded by a mound, and been a great basin. The ground in the middle, where the Parana, the Madeira, and the Plata, take their rise, is an immense marsh, uninhabitable for its exhalations, and quite impervious in its present state.

The manner in which the continent of North America is watered, or rather drained, has also some peculiarities. By looking at the map, one will observe first of all a general division of the whole of the best known

part into two, by the valleys in which the beds of the river St Lawrence and Mississippi are situated. The head of this is occupied by a singular series of fresh water seas or lakes, viz. the lakes Superior and Michigan, which empty themselves into lake Huron by two cataracts. This again runs into lake Erie by the river Detroit, and the Erie pours its waters into the Ontario by the famous fall of Niagara, and from the Ontario proceeds the great river St Lawrence.

The ground to the south-west of the lakes Superior and Erie is somewhat lower, and the middle of the valley is occupied by the Mississippi and the Missouri, which receive on both sides a number of smaller streams, and having joined, proceed to the south, under the name Mississippi. In latitude 37°, this river receives into its bed the Ohio, a river of equal magnitude, and the Ohio takes river, which drains all the country lying at the back of the United States, separated from them by the ranges of the Appalachian mountains. The Mississippi now one of the chief rivers on the globe, and proceeds due south, till it falls into the Mexican bay through several shifting mouths, which greatly resemble those of the Danube and the Nile, having more than 1000 miles.

The elevated country between the Mississippi and St Lawrence and the Atlantic ocean is bounded on the east side by a great number of high mountains, which are very considerable, and of long extent; but instead of being nearly at right angles to the coast, as in other countries, they are in a great measure parallel to it. This is more remarkably the case with Hudson's river, the Delaware, Potomac, Chesapeake, &c. Indeed the whole of North America seems to consist of ribs or ridges laid nearly parallel to each other from north to south, and the rivers run down the interstices. All those which empty themselves into the bay of Mexico are parallel and almost perfectly straight, unlike what are seen in other parts of the world. The westernmost of them all, the North River, as it is named by the Spaniards, is nearly as long as the Mississippi. We are very little informed as yet of the distribution of rivers on the north-west coast of America, or the course of those which run into Hudson's and Baffin's bay.

The Maragnon is undoubtedly the greatest river in the world, both as to length of run and the vast body of water which it rolls along. The other great rivers succeed nearly in the following order:

Maragnon,	Amur,
Senegal,	Oronoko,
Nile,	Ganges,
St Lawrence,	Euphrates,
Hwangho,	Danube,
Rio de la Plata,	Dou,
Yenisey,	Indus,
Mississippi,	Dnieper,
Volga,	Dauna,
Oby,	&c.

We have been much assisted in this account of the course of rivers, and their distribution over the globe, by a beautiful planisphere or map of the world published by Mr Bode astronomer royal at Berlin. The ranges of mountains are there laid down with philosophical discernment and precision; and we recommend it to the

notice

**Theory.** notice of our geographers. We cannot divine what has caused M. Buffon to say that the course of most rivers is from east to west or from west to east. No physical point of his system seems to require it, and it needs only that we look at his own map to see its fallacy. We should naturally expect to find the general course of rivers nearly perpendicular to the line of sea coast; and

we find it so; and the chief exceptions are in opposition to M. Buffon's assertion. The structure of America is so particular, that very few of its rivers have their general course in this direction. We proceed now to consider the motion of rivers; a subject which naturally resolves itself into two parts, *theoretical* and *practical*.

Theory.

## PART I. THEORY OF THE MOTION OF RIVERS AND CANALS.

14  
Importance  
of the doc-  
trine of the  
motion of  
Rivers and  
canals.

**T**HE importance of this subject needs no comment. Every nation, every country, every city, is interested in it. Neither our wants, our comforts, nor our pleasures, can dispense with its assistance. We must conduct their waters to the centre of our dwellings, we must secure ourselves against their overflowings, we must employ them to drive those machines which, by expending for our personal weakness, make a few able to perform the work of thousands; we employ them to irrigate and fertilize our fields, to facilitate our commerce, to transport from country to country those things which, necessarily, inconveniently, or even, sometimes, impossible to move; for these purposes, we must govern the mighty rivers, we must regulate or change the beds of the smaller streams, we must, from them, draw water for our fields, and for our cities, we must supply our houses. We must know their nature, for the purpose of navigation, we must know their capacity, we must drain our soil, and we must know when drainage is most understood, their motions, and their mode of descent, flow, but we must know the nature of the soil, our canals, our dikes, our levees, and our bridges. A constant how to proceed in their daily recurring action, how often do we see the effects of high expectation and heavy expense fail of their object, leaving the late husband with works not only useless but frequently harmful. It has long been a most interesting subject of study to the farmer, the fisherman, the sailor, the merchant, the statesman, the philosopher, and the poet. It is the source of their numerous calamities from the rivers which traverse them; and in England and Holland, where their waters are every moment ready to swallow up the inhabitants, and where the inhabitants, having once subdued this formidable enemy, have made these very waters their indefatigable drudges, transporting through every corner of the country the materials of the most extensive commerce on the face of this globe.

Such having been our incessant occupations with moving waters, we should expect that while the operative artists are continually furnishing facts and experiments, the man of speculative and scientific curiosity, excited by the importance of the subject, would ere now have made considerable progress in the science; and that the professional engineer would be daily acting from established principle, and be seldom disappointed in his expectations. Unfortunately the reverse of this is nearly the trite state of the case; each engineer is obliged to collect the greatest part of his knowledge from his own experience, and by many dear-bought lessons, to direct his future operations, in which he still proceeds

with anxiety and hesitation: for we have not yet acquired principles of theory, and experiments have not yet been collected and published, by which an empirical practice might be safely formed. Many experiments of inestimable value are daily made; but they remain with their authors, who seldom have either leisure, ability, or generosity, to add them to the public stock.

The motion of waters has been really so little investigated as yet, that hydraulics may still be called a new study. We have merely skimmed over a few common notions concerning the motions of water; and the mathematicians of the first order seem to have contented themselves with such views as allowed them to entertain themselves with elegant applications of calculus. This, however, has not been their fault. They rarely had any opportunity of doing more, for want of a knowledge of facts. They have made excellent use of the few which have been given them; but it required much labour, great variety of opportunity, and great experience, to learn the multiplicity of things which are combined even in the simplest cases of water in motion. These are seldom the lot of the mathematician; and he is without blame when he enjoys the pleasures within his reach, and cultivates the science of geometry in its most abstracted form. Here he makes a progress which is the boast of human reason, being almost ensured from error by the intellectual simplicity of his subject. But when we turn our attention to material objects, and without knowing either the size and shape of the elementary particles, or the laws which nature has prescribed for their action, presume to foresee their effects, calculate their exertions, direct their actions, what must be the consequence? Nature shows her independence with respect to our notions, and, always faithful to the laws which are enjoined, and of which we are ignorant, she never fails to thwart our views, to disconcert our projects, and render useless all our efforts.

To wish to know the nature of the elements is vain, and our gross organs are insufficient for the study. To suppose what we do not know, and to fancy shapes and faces at will; this is to raise phantoms, and will produce a system, but will not prove a foundation, for any science. But to interrogate Nature herself, study the laws which she so faithfully observes, catch her, as we say, in the fact, and thus wrest from her the secret; this is the only way to become her master, and it is the only procedure consistent with good sense. And we see, that soon after Kepler detected the laws of the planetary motions, when Galileo discovered the uniform acceleration of gravity, when Pascal discovered the pressure of the atmosphere, and Newton discovered the laws of attraction and the track of a ray of light; astronomy, mechanics, hydrostatics, chemistry, optics, quickly be-

Theory. came bodies of sound doctrine; and the deductions from their respective theories were found fair representations of the phenomena of nature. Whenever a man has discovered a law of nature, he has laid the foundation of a science, and he has given us a new mean of subjecting to our service some element hitherto independent: and so long as groups of natural operations follow a route which appears to us whimsical, and will not admit our calculations, we may be assured that we are ignorant of the principle which connects them all, and regulates their procedure.

17  
Our ignorance of the general laws of this motion,

This is remarkably the case with several phenomena in the motions of fluids, and particularly in the motion of water in a bed or conduit of any kind. Although the first geniuses of Europe have for this century past turned much of their attention to this subject, we are almost ignorant of the general laws which may be observed in their motions. We have been able to select very few points of resemblance, and every case remains nearly an individual. About 150 years ago we discovered, by experience only, the quantity and velocity of water issuing from a small orifice, and, after much labour, have extended this to any orifice; and this is almost the whole of our confidential knowledge. But as to the uniform course of the streams which water the face of the earth, and the maxims which will certainly regulate this agreeably to our wishes, we are in a manner totally ignorant. Who can pretend to say what is the velocity of a river of which you tell him the breadth, the depth, and the declivity? Who can say what swell will be produced in different parts of its course, if a dam or weir of given dimensions be made in it, or a bridge be thrown across it? or how much its waters will be raised by turning another stream into it, or sunk by taking off a branch to drive a mill? Who can say with confidence what must be the dimensions or slope of this branch, in order to furnish the water that is wanted, or the dimensions and slope of a canal which shall effectually drain a feyny district? Who can say what form will cause or will prevent the undermining of banks, the forming of elbows, the pooling of the bed, or the deposition of sands? Yet these are the most important questions.

18  
and the causes of it.

The causes of this ignorance are the want or uncertainty of our principles; the falsity of our only theory, which is belied by experience; and the small number of proper observations or experiments, and difficulty of making such as shall be serviceable. We have, it is true, made a few experiments on the efflux of water from small orifices, and from them we have deduced a sort of theory, dependant on the fall of heavy bodies and the laws of hydrostatic pressure. Hydrostatics is indeed founded on very simple principles, which give a very good account of the laws of the quiescent equilibrium of fluids, in consequence of gravity and perfect fluidity. But by what train of reasoning can we connect these which the phenomena of the uniform motion of the waters of a river or open stream, which can derive its motion only from the slope of its surface, and the modifications of this motion or its velocity only from the width and depth of the stream? These are the only circumstances which can distinguish a portion of a river from a vessel of the same size and shape, in which, however, the water is at rest. In both, gravity is the sole cause of pressure and motion; but there must be some

circumstance peculiar to running waters which modifies the exertions of this active principle, and which, when discovered, must be the basis of hydraulics, and must oblige us to reject every theory founded on fancied hypotheses, and which can only lead to absurd conclusions: and surely absurd consequences, when legitimately drawn, are complete evidence of improper principles.

When it was discovered experimentally, that the velocities of water issuing from orifices at various depths under the surface were as the square roots of those depths, and the fact was verified by repeated experiments, this principle was immediately and without modification applied to every motion of water. Mariotte, Varignon, Guglielmini, made it the basis of complete systems of hydraulics, which prevail to this day, after having received various amendments and modifications. The same reasoning obtains through them all, though frequently obscured by other circumstances, which are more periphrastically expressed by Guglielmini in his Fundamental Theorems.

Theory.

19  
Principle on which the systems of hydraulics depend.

He considers every point P (fig. 1.) in a mass of fluid as an orifice in the side of a vessel, and conceives the particle as having a tendency to move with the same velocity with which it would issue from the orifice. Therefore, if a vertical line APC be drawn from that point, and if this be made the axis of a parabola ADE, of which A at the surface of the fluid is the vertex, and AB (four times the height through which a heavy body would fall in a second) is the parameter, the velocity of this particle will be represented by the ordinate PD of this parabola; that is, PD is the space which it would uniformly describe in a second.

Plate  
20

From this principle is derived the following theory of running waters.

Theory derived from it.

Let DC (fig. 2.) be the horizontal bottom of a reservoir, to which is joined a sloping channel CE of uniform breadth, and let AB be the surface of the standing water in the reservoir. Suppose the vertical plane BC pierced with an infinity of holes, through each of which the water issues. The velocity of each filament will be that which is acquired by falling from the surface AB. The filament C, issuing with this velocity, will then glide down the inclined plane like any other heavy body; and (by the common doctrine of the motion down an inclined plane) when it has arrived at E, it will have the same velocity which it would have acquired by falling through the height OF, the point O being in the horizontal plane AB produced. The same may be said of its velocity when it arrives at H or K. The filament immediately above C will also issue with a velocity which is in the subduplicate ratio of its depth, and will then glide down above the first filament. The same may be affirmed of all the filaments, and of the superficial filament, which will occupy the surface of the descending stream.

See Guglielmini's Hydraulics, 21.

From this account of the genesis of a running stream of water, we may fairly draw the following consequences:

22  
The consequences drawn from this theory

1. The velocity of any particle R, in any part of the stream, is that acquired by falling from the horizontal place AN.
2. The velocity at the bottom of the stream is everywhere greater than anywhere above it, and is least of all at the surface.
3. The velocity of the stream increases continually as the stream recedes from its source.

4. The

Theory.

4. The depths EF, GH, &c. in different parts of the stream, will be nearly in the inverse subduplicate ratio of the depths under the surface AN: for since the same quantity of water is running through every section EF and GH, and the channel is supposed of uniform breadth, the depth of each section must be inversely as the velocity of the water passing through it. This velocity is indeed different in different filaments of the section; but the mean velocity in each section is in the subduplicate ratio of the depth of the filament under the surface AB. Therefore the stream becomes more shallow as it recedes from the source; and in consequence of this the difference between LH and MH continually diminishes, and the velocities at the bottom and surface of the stream continually approach to equality, and at a great distance from the source they differ insensibly.

If the breadth of the stream be contracted in any part, the depth of the running water will be increased in that part, because the same quantity must still pass through; but the velocity at the bottom will remain the same, and that at the surface will be less than it was before; and the area of the section will be diminished in the whole.

If a sluice be put across the stream, dipping a little into the water, the water must immediately rise on the upper side of the sluice till it rises above the level of the reservoir, and the smallest immersion of the sluice will produce this effect. For by lowering the sluice, the area of the section is diminished, and the velocity cannot be increased till the water heap up to a greater height than the surface of the reservoir, and this acquired pressure will produce a greater velocity of efflux through the orifice left below the sluice.

An additional quantity of water coming into this channel will increase the depth of the stream, and the quantity of water which it conveys; but it will not increase the velocity of the bottom filaments, unless it comes from a higher source.

These consequences are contrary to experience, and show the imperfection, at least, of the explanation.

The third consequence is of all the most contrary to experience. If any one will but take the trouble of following a single brook from its source to the sea, he will find it most rapid in its beginnings among the mountains, gradually slackening its pace as it winds among the hills and gentler declivities, and at last creeping slowly along through the flat grounds, till it is checked and brought to rest by the sides of the ocean.

Nor is the second consequence more agreeable to observation. It is universally found, that the velocity of the surface in the middle of the stream is the greatest of all, and that it gradually diminishes from thence to the bottom and sides.

And the first consequence, if true, would render the running waters on the surface of this earth the instruments of immediate ruin and devastation. If the waters of our rivers, in the cultivated parts of a country, which are two, three, and four hundred feet lower than their sources, run with the velocity due to that height, they would in a few minutes lay the earth bare to the very bones.

The velocities of our rivers, brooks, and rills, being so greatly inferior to what this theory assigns to them

the other consequences are equally contrary to experience. When a stream has its section diminished by narrowing the channel, the current increases in depth, and this is always accompanied by an increase of velocity through the whole of the section, and most of all at the surface; and the area of the section does not increase, but diminishes, all the phenomena, thus contradicting in every circumstance the deduction from the theory; and when the section has been diminished by a sluice let down into the stream, the water gradually heaps up on the upper side of the sluice, and, by its pressure, produces an acceleration to the stream below the sluice, in the same way as if it were the beginning of a stream, as explained in the theory. The velocity now is composed of the velocity preserved from the source and the velocity produced by this subordinate accumulation; and this accumulation and velocity continually increase, till they become such that the whole supply is again discharged through this contracted section: any additional water not only increases the quantity carried along the stream, but also increases the velocity, and therefore the section does not increase in the proportion of the quantity.

It is surprising that a theory really founded on a The theory conceit, and which in every the most familiar and obvious circumstance is contradicted by facts, should have met with so much attention. That Varignon should immediately catch at this notion of Guglielmini, and make it the subject of many elaborate analytical memoirs, is not to be wondered at. This author only wanted *donner prise au calcul*; and it was a usual joke among the academicians of Paris, when any new theorem was invented, *donnons le à Varignon à généraliser*. But his numerous theorems and corollaries were adopted by all, and still make the substance of the present systems of hydraulics. Gravefande, Muschenbroek, and all the elementary treatises of natural philosophy, deliver no other doctrines; and Belidor, who has been considered as the first of all the scientific engineers, details the same theory in his great work the *Architecture Hydraulique*.

Guglielmini was, however, not altogether the dupe though of his own ingenuity. He was not only a pretty good mathematician, but an assiduous and sagacious observer. He had applied his theory to some important cases which occurred in the course of his profession as inspector of the rivers and canals in the Milanese, and to the course of the Danube; and could not but perceive that great corrections were necessary for making the theory quadrate in some tolerable manner with observation; and he immediately saw that the motion was greatly obstructed by inequalities of the canal, which gave to the contiguous filaments of the stream transverse motions, which thwarted and confused the regular progress of the rest of the stream, and thus checked its general progress. These obstructions, he observed, were most effectual in the beginning of its course, while yet a small rill, running among stones, and in a very unequal bed. The whole stream being small, the inequalities bore a great proportion to it, and thus the general effect was great. He also saw that the same causes (these transverse motions produced by the unequal bottom) chiefly affected the contiguous filaments, and were the reasons why the velocity at the sides and bottom was so much diminished as to be less than the superficial velocity, and that even this might come to be diminished

**Theory.** diminished by the same cause. For he observed, that the general stream of a river is frequently composed of a sort of boiling or tumbling motion, by which masses of water are brought up to the surface and again descend. Every person must recollect such appearances in the freshes of a muddy river; and in this way Guglielmini was enabled to account in some measure for the disagreement of his theory with observation.

Mariotte had observed the same observations even in the smoothest glass pipes. Here it could not be ascribed to the checks occasioned by transverse motions. He therefore ascribed it to friction, which he supposed to diminish the motion of fluid bodies in the same manner as of solids: and he thence concludes, that the filaments which immediately rub on the sides of the tube have their velocity gradually diminished; and that the filaments immediately adjoining to these, being thus obliged to pass over them or outstrip them, rub upon them, and have their own velocity diminished in like manner, but in a smaller degree; and that the succeeding filaments towards the axis of the tube suffer similar but smaller diminutions. By this means the whole stream may come to have a smaller velocity; and at any rate the medium velocity by which the quantity discharged is determined, is smaller than it would have been independent of friction.

Guglielmini adopted this opinion of Mariotte, and in his next work on the Motion of Rivers, considered this as the chief cause of the retardation; and he added a third circumstance, which he considered as of no less consequence, the viscosity or tenacity of water. He observes that syrup, oil, and other fluids, where this viscosity is more remarkable, have their motions prodigiously retarded by it, and supposes that water differs from them only in the degree in which it possesses this quality: and he says, that by this means not only the particles which are moving more rapidly have their motions diminished by those in their neighbourhood which move slower, but that the filaments also which would have moved more slowly are accelerated by their more active neighbours; and that in this manner the superficial and inferior velocities are brought nearer to an equality. But this will never account for the universal fact, that the superficial particles are the swiftest of all. The superficial particles, says he, acquire by this means a greater velocity than the parabolic law allows them; the medium velocity is often in the middle of the depth; the numerous obstacles, continually multiplied and repeated, cause the current to lose the velocity acquired by the fall; the slope of the bottom then diminishes, and often becomes very small, so that the force remaining is hardly able to overcome the obstacles which are still repeated, and the river is reduced almost to a state of stagnation. He observes, that the Rheno, a river of the Milanese, has near its mouth a slope of no more than 50", which he considers as quite inadequate to the task; and here he introduces another principle, which he considers as an essential part of the theory of open currents. This is, that there arises from the very depth of the stream a propelling force which is a part of the lost velocity. He offers nothing in proof of this principle, but uses it to account for and explain the motion of waters in horizontal canals. The principle has been adopted by the numerous Italian writers on hydraulics, and, by various contrivances, in-

terwoven with the parabolic theory, as it is called, of Guglielmini. Our reader may see it in various modifications in the *Idrostatica e Idraulica* of P. Lecchi, and in the *Sperienze Idrauliche* of Michelotti. It is by no means distinct either in its origin or in the manner of its application to the explanation of phenomena, and seems only to serve for giving something like consistency to the vague and obscure discussions which have been published on this subject in Italy. We have already remarked, that in that country the subject is particularly interesting, and has been much commented upon. But the writers of England, France, and Germany, have not paid so much attention to it, and have more generally occupied themselves with the motion of water in close conduits, which seem to admit of a more precise application of mathematical reasoning.

Some of those have considered with more attention the effects of friction and viscosity. Sir Isaac Newton, with his usual penetration, had seen distinctly the manner in which it behaved these circumstances to operate. He had occasion, in his researches into the mechanism of the celestial motions, to examine the famous hypothesis of Descartes, that the planets were carried round the sun by fluid vortices, and saw that it led to no end to uncertainty and dispute till he was assured of these vortices was mechanically impossible. He therefore employed himself in the investigation of the manner in which the acknowledged power of natural bodies, acting according to the received laws of mechanics, could produce and preserve these motions, and restore that motion which was expended in carrying the planets round the sun. He therefore, in the second book of the *Principles of Natural Philosophy*, gives a series of beautiful propositions, viz. 31, 32, &c. with their corollaries, showing how the rotation of a cylinder or sphere round its axis in the midst of a fluid will excite a vortical motion in this fluid, and he determines with mathematical precision the motion of every filament of the vortex.

He sets out from the supposition that this motion is excited in the surrounding stratum of fluid in consequence of a want of perfect lubricity, and assumes as an hypothesis, that the initial resistance (or diminution of the motion of the cylinder) which arises from this want of lubricity, is proportional to the velocity with which the surface of the cylinder is separated from the contiguous surface of the surrounding fluid, and that the whole resistance is proportional to the velocity with which the parts of the fluid are mutually separated from each other. From this, and the equality of action and reaction, it evidently follows, that the velocity of any stratum of the vortex is the arithmetical medium between the velocities of the strata immediately within and without it. For the intermediate stratum cannot be in equilibrio, unless it is as much pressed forward by the superior motion of the stratum within it, as it is kept back by the slower motion of the stratum without it.

This beautiful investigation applies in the most perfect manner to every change produced in the motion of a fluid filament, in consequence of the viscosity and friction of the adjoining filaments; and a filament proceeding along a tube at some small distance from the sides has, in like manner, a velocity which is the medium between those of the filaments immediately surrounding it.

**Theory.** It is therefore a problem of no very difficult solution to assign the law by which the velocity will gradually diminish as the filament recedes from the axis of a cylindrical tube. It is somewhat surprising that so neat a problem has never occupied the attention of the mathematicians during the time that these subjects were so assiduously studied; but so it is, that nothing precise has been published on the subject. The only approach to a discussion of this kind, is a Memoire of Mr Pitot, read to the academy of Paris in 1726, where he considers the velocity of efflux through a pipe. Here, by attending to the comparative superiority of the quantity of motion in large pipes, he affirms, that the total diminutions arising from friction will be *(ceteris paribus)* in the inverse ratio of the diameters. This was thoughtfully received by other writers, and is now a part of our hydraulic theories. It has not, however, been attended to by those who write on the motion of rivers, though it is evident that it is applicable to them with equal propriety; and had it been introduced, it would at least have solved all their difficulties, and particularly would have shown how an almost imperceptible depth of water could produce the great motion of a great river, and how it could occur to the most eligible principles of the subject.

Some experiments on the motions of the waters in the great pipes of Versailles, in order to ascertain the nature of the retardations occasioned by friction, they were found prodigious; but were so irregular, and unsuited to reduction to any general principle, (and the experiments were indeed so few that they were not for the reduction) that he could establish nothing. What Mr Belidor established on them, and makes a sort of promise to direct future engineers, is quite unworthy of the subject. Upon the whole, this branch of hydraulics, although of much greater practical importance than the conduct of water in pipes, has never yet obtained more than a vague, and, we may call it, slovenly attention from the mathematicians; and we ascribe it to their not having taken the pains to settle its first principles with the same precision as had been done in the other branch. They were, from the beginning, furnished with a sort of applicability of mathematical principles, without ever making the application. Were it not that some would ascribe us of national partiality, we would ascribe it to this, that Newton had not pointed out the way in this as in the other branch. For any intelligent reader, of the performance on the motions of fluids in close vessels, will see that there has not a principle, nor hardly a step of investigation, been added to those which were used or pointed out by Sir Isaac Newton. He has nowhere touched this question, the motion of water in an open canal. In his theories of the tides, and of the propagation of waves, he had an excellent opportunity for giving at once the fundamental principles of motion in a free fluid whose surface was not horizontal. But, by means of some of those happy and shrewd guesses, in which, as Daniel Bernouilli says, he excelled all men, he saw the undoubted consequences of some palpable phenomena which would answer all his present purposes, and therefore entered no farther into the investigation.

26  
Stances at  
all improv-  
ed since  
his time.

The original theory of Guglielmini, or the principle adopted by him, that each particle of the vertical sec-

tion of a running stream has a tendency to move as if it were issuing from an orifice at that depth under the surface, is false; and that it really does so in the face of a dam when the flood-gate is taken away, is no less so; and if it did, the subsequent motions would hardly have any resemblance to those which he assigns them. Were this the case, the exterior form of the cascade would be something like what is sketched in fig. 3. with an abrupt angle at B, and a concave surface BEG. This will be evident to every one who combines the greater velocity of the lower filaments with the slower motion of those which must slide down above them. But this greater advance of the lower filaments cannot take place without an expenditure of the water under the surface AB. The surface therefore sinks, and B instantly ceases to retain its place in the horizontal plane. The water does not successively flow forward from A to B, and then tumble over the precipice; but immediately upon opening the flood-gate, the water wafts from the space immediately behind it, and the whole puts on the form represented in fig. 4. consisting of the curve A a P c EG, convex from A to c, and concave from thence forward. The superficial water begins to accelerate all the way from A; and the particles may be supposed (for the present) to have acquired the velocity corresponding to their depth under the horizontal surface. This must be understood as nothing more than a vague sketch of the motions. It requires a very critical and intricate investigation to determine either the form of the upper curve or the motions of the different filaments. The place A, where the curvature begins, is of equally difficult determination, and is various according to the differences of depth and of inclination of the succeeding canal.

**Theory.**

Plate  
CCCCXXII.

We have given this sort of history of the progress which had been made in this part of hydraulics, that our readers might form some opinion of the many diffusions which have been written on the motion of rivers, and of the state of the arts depending on it. Much of the business of the civil engineer is intimately connected with it: and we may therefore believe, that since there was so little principle in the theories, there could be but very little certainty in the practical operations. The fact has been, that no engineer could pretend to say, with any precision, what would be the effect of his operations. One whose business had given him many opportunities, and who kept accurate and judicious registers of his own works, could pronounce, with some probability, how much water would be brought off by a drain of certain dimensions and a given slope, when the circumstances of the case happened to tally with some former work in which he had succeeded or failed; but out of the pale of his own experience he could only make a sagacious guess. A remarkable instance of this occurred not long ago. A small aqueduct was lately carried into Paris. It had been conducted on a plan presented to the academy, who had corrected it, and gave a report of what its performance would be. When executed in the most accurate manner, it was deficient in the proportion of five to nine. When the celebrated Desaguliers was employed by the city of Edinburgh to superintend the bringing in the water for the supply of the city, he gave a report on the plan which was to be followed. It was executed to his complete satisfaction; and the quantity of water

Uncertainty of the theories when applied to practice exemplified.

**Theory.** water delivered was about one-sixth of the quantity which he promised, and about one-eleventh of the quantity which the no less celebrated M. Laurin calculated from the same plan.

28

Necessity of  
multiplying  
experiments.

Such being the state of our theoretical knowledge (if it can be called by this name), naturalists began to be persuaded that it was but losing time to make any use of a theory so incongruous with observation, and that the only safe method of proceeding was to multiply experiments in every variety of circumstances, and to make a series of experiments in every important case, which should comprehend all the practicable modifications of that case. Perhaps circumstances of resemblance might occur, which would enable us to connect many of them together, and at last discover the principles which occasioned this connexion; by which means a theory founded on science might be obtained. And if this point should not be gained, we might perhaps find a few general facts, which are modified in all these particular cases, in such a manner that we can still trace the general facts, and see the part of the particular case which depends on it. This would be the acquisition of what may be called an empirical theory, by which every phenomenon would be explained, in so far as the explanation of a phenomenon is nothing more than the pointing out the general fact or law under which it is comprehended; and this theory would answer every practical purpose, because we should confidently foresee what consequences would result from such and such premises; or if we should fail even in this, we should still have a series of experiments so comprehensive, that we could tell what place in the series would correspond to any particular case which might be proposed.

29

Labours of  
Michelotti  
and Bossut  
in this way;

There are two gentlemen, whose labours in this respect deserve very particular notice, Professor Michelotti at Turin, and Abbé Bossut at Paris. The first made a prodigious number of experiments both on the motion of water through pipes and in open canals. They were performed at the expence of the sovereign, and no expence was spared. A tower was built of the finest masonry, to serve as a vessel from which the water was to issue through holes of various sizes, under pressures from 5 to 22 feet. The water was received into basons constructed of masonry and nicely lined with stucco, from whence it was conveyed in canals of brick-work lined with stucco, and of various forms and declivities. The experiments on the expence of water through pipes are of all that have yet been made the most numerous and exact, and may be appealed to on every occasion. Those made in open canals are still more numerous, and are no doubt equally accurate; but they have not been so contrived as to be so generally useful, being in general very unlike the important cases which will occur in practice, and they seem to have been contrived chiefly with the view of establishing or overturning certain points of hydraulic doctrine which were probably prevalent at the time among the practical hydraulists.

The experiments of Bossut are also of both kinds; and though on a much smaller scale than those of Michelotti, seem to deserve equal confidence. As far as they follow the same track, they perfectly coincide in their results, which should procure confidence in the other; and they are made in situations much more analogous to the usual practical cases. This makes

them doubly valuable. They are to be found in his two volumes entitled *Hydrodynamique*. He has opened this path of procedure in a manner so new and so judicious, that he has in some measure the merit of such as shall follow him in the same path.

Theory,

This has been most candidly and liberally allowed and the him by the chevalier de Buat, who has taken up this matter where the Abbé Bossut left it, and has prosecuted his experiments with great assiduity; and we must now add with singular success. By a very judicious consideration of the subject, he hit on a particular view of it, which saved him the trouble of a minute consideration of the small internal motions, and enabled him to proceed from a very general and evident proposition, which may be received as the key to a complete system of practical hydraulics. We shall follow this ingenious author in what we have farther to say on the subject; and we doubt not but that our readers will think we do a service to the public by bringing these discussions of the chevalier de Buat more generally known in this country. It must not however be expected that we shall give more than a general view of them, connected by such familiar reasoning as shall be either comprehended or conversant with persons not deeply versed in mathematical science.

progressive  
experiments of  
De Buat.

#### SECTION I. Theory of Rivers.

31

It is certain that the motion of open streams must, in some respects, resemble that of bodies sliding down inclined planes perfectly polished; and that they would accelerate continually, were they not obstructed; but they are obstructed, and frequently move uniformly. This can only arise from an equilibrium between the forces which promote their descent and those which oppose it. M. Buat, therefore, assumes the leading proposition, that

His leading  
proposition

*When water flows uniformly on any channel or bed, the accelerating force which obliges it to move is equal to the sum of all the resistances which it meets with, whether arising from its own viscosity, or from the friction of its bed.*

This law is as old as the formation of rivers, and should be the key of hydraulic science. Its evidence is clear; and it is, at any rate, the basis of all uniform motion. And since it is so, there must be some considerable analogy between the motion in pipes and in open channels. Both owe their origin to an inequality of pressure; both would accelerate continually, if nothing hindered; and both are reduced to uniformity by the viscosity of the fluid and the friction of the channel.

It will therefore be convenient to examine the phenomena of water moving in pipes by the action of its weight only along the sloping channel. But previous to this, we must take some notice of the obstruction to the entry of water into a channel of any kind, arising from the deflection of the many different filaments which press into the channel from the reservoir from every side. Then we shall be able to separate this diminution of motion from the sum total that is observed, and ascertain what part remains as produced by the subsequent obstructions.

32

The subject  
of the following  
discussion proposed.

We then shall consider the principle of uniform motion, the equilibrium between the power and the resistance. The power is the relative height of the column of fluid which tends to move along the inclined plane of its bed; the resistance is the friction of

of

*Theory.* of the bed, the viscosity of the fluid, and its adhesion to the sides. Here are necessarily combined a number of circumstances which must be gradually detached that we may see the effect of each, viz. the extent of the bed, its perimeter, and its slope. By examining the effects produced by variations of each of these separately, we discover what share each has in the general effect; and having thus analyzed the complicated phenomenon, we shall be able to combine those its elements, and frame a formula which shall comprehend every circumstance, from the greatest velocity to the extinction of all motion, and from the extent of a river to the narrow dimensions of a quill. We shall compare this formula with a series of experiments in all this variety of circumstances, partly made by M. Buisson, and partly collected from other authors; and we shall leave the reader to judge of the agreement.

Confident that this agreement will be found most satisfactory, we shall then proceed to consider very particularly the chief varieties which nature or art may introduce into their beds, the different velocities of the flow, the reality of the resistance produced by the roughness of the materials of the channel, and the force of the current by which it continually acts on this roughness, leading to change either its dimensions or its form. We shall endeavour to trace the origin of these great obstacles which form like the branches of a vigorous tree, and occupy the surface even of a vast continent. We shall follow them in their course, unfold all their windings, study their train, and regimen, and point out the law of its stability; and we shall investigate the causes of their deviations and wanderings.

The study of these natural laws pleases the mind: but it answers a still greater purpose; it enables us to assist nature, and to direct her operations, which our wants and our impatience often find too slow. It enables us to command the elements, and to force them to submit to our wants and our pleasures.

We shall therefore, in the next place, apply the knowledge which we may acquire to the solution of the most important hydraulic questions which occur in the practice of the civil engineer.

We shall consider the effects produced by a permanent addition to any river or stream by the union of another, and the opposite effect produced by any drought or offset, showing the elevation or depression produced up the stream, and the change made in the depth and velocity below the addition or offset.

We shall pay a similar attention to the temporary levels produced by freshes.

We shall ascertain the effects of straightening the course of a stream, which, by increasing its slope, must increase its velocity, and therefore sink the waters above the place where the curvature was removed, and diminish the tendency to overflow, while the same immediate consequence must expose the places farther down to the risk of floods from which they would otherwise have been free.

The effects of dams or weirs, and of bars, must then be considered; the gorge or swell which they produce up the stream must be determined for every distance from the weir or bar. This will furnish us with rules for rendering navigable or floatable such waters as have too little depth or too great slope. And it will appear

that immense advantages may be thus derived, with a moderate expence, even from trifling brooks, if we will relinquish all prejudices, and not imagine that such conveyance is impossible, because it cannot be carried on by such boats and small craft as we have been accustomed to look at.

The effects of canals of derivation, the rules or maxims of draining, and the general maxims of embankment, come in the next place; and our discussions will conclude with remarks on the most proper forms for the entry to canals, locks, docks, harbours, and mouths of rivers, the best shape for the starlings of bridges, and of boats for inland navigations, and such like subordinate but interesting particulars, which will be suggested by the general thread of discussion.

It is considered, as physically demonstrated (see *HYDROSTATICS* and *HYDRAULICS*), that water issuing from a small orifice in the bottom or side of a very large vessel, almost instantly acquires and maintains the velocity which a heavy body would acquire by falling to the orifice from the horizontal surface of the stagnant water. This we shall call its **NATURAL VELOCITY**. Therefore if we multiply the area of the orifice by this velocity, the product will be the bulk or quantity of the water which is discharged. This we may call the **NATURAL EXPENCE** of water, or the **NATURAL DISCHARGE**.

Let  $O$  represent the area or section of the orifice expressed in some known measure, and  $b$  its depth under the surface. Let  $g$  express the velocity acquired by a heavy body during a second by falling. Let  $V$  be the medium velocity of the water's motion,  $Q$  the quantity of water discharged during a second, and  $N$  the natural expence.

We know that  $V$  is equal to  $\sqrt{2g} \times \sqrt{b}$ . Therefore  $N = O \cdot \sqrt{2g} \cdot \sqrt{b}$ .

If these dimensions be all taken in English feet, we have  $\sqrt{2g}$  very nearly equal to 8; and therefore  $V = 8\sqrt{b}$ , and  $N = O \cdot 8\sqrt{b}$ .

But in our present business it is much more convenient to measure every thing by inches. Therefore since a body acquires the velocity of 32 feet 2 inches in a second, we have  $2g = 64$  feet 4 inches or 772 inches, and  $\sqrt{2g} = 27.78$  inches nearly  $27\frac{1}{2}$  inches.

Therefore  $V = \sqrt{772} \sqrt{b} = 27.78 \sqrt{b}$ , and  $N = O \cdot \sqrt{772} \sqrt{b} = O \cdot 27.78 \sqrt{b}$ .

But it is also well known, that if we were to calculate the expence or discharge for every orifice by this simple rule, we should in every instance find it much greater than nature really gives us.

When water issues through a hole in a thin plate, the lateral columns, pressing into the hole from all sides, cause the issuing filaments to converge to the axis of the jet, and contract its dimensions at a little distance from the hole. And it is in this place of greatest contraction that the water acquires that velocity which we observe in our experiments, and which we assume as equal to that acquired by falling from the surface. Therefore, that our computed discharge may best agree with observation, it must be calculated on the supposition that the orifice is diminished to the size of this smallest section. But the contraction is subject to variations, and the dimensions of this smallest section are

*Theory.*

33  
Natural velocity, expence and discharge through small orifices.

Theory. are at all times difficult to ascertain with precision. It is therefore much more convenient to compute from the real dimensions of the orifice, and to correct this computed discharge, by means of an actual comparison of the computed and effective discharges in a series of experiments made in situations resembling those cases which most frequently occur in practice. This correction or its cause, in the mechanism of these internal motions, is generally called *Contraction* by the writers on hydraulics; and it is not confined to a hole in a thin plate; it happens in some degree in all cases where fluids are made to pass through a narrow place. It happens in the entry into all pipes, canals, and sluices; nay even in the passage of water over the edge of a board, such as is usually the case at the head of a dam or weir, and even when this is immersed in water on both sides, as in a bar or lock. It is frequently employed for raising the waters of the great streams in Flanders, in order to render them navigable.

We mentioned an observation \* of M. Bossut to this effect, when he saw a gooseberry rise up from the bottom of the canal along the face of the bar, and then rapidly fly over its top. We have attempted to represent this motion of the filaments in these different situations.

\* See *Refluxance of Fluids*, N<sup>o</sup> 67.  
35  
Motion of filaments in various particular situations,

Fig. 5. A shows the motion through a thin plate. B shows the motion when a tube of about two diameters long is added, and when the water flows with a full mouth. This does not always happen in so short a pipe (and never in one that is shorter), but the water frequently detaches itself from the sides of the pipe, and flows with a contracted jet.

C shows the motion when the pipe projects into the inside of the vessel. In this case it is difficult to make it flow full.

D represents a mouth-piece fitted to the hole, and formed agreeably to that shape which a jet would assume of itself. In this case all contraction is avoided, because the mouth of this pipe may be considered as the real orifice, and nothing now diminishes the discharge but a trifling friction of the sides.

E shows the motion of water over a dam or weir, where the fall is free or unobstructed: the surface of the lower stream being lower than the edge or sole of the waste-board.

F is a similar representation of the motion of water over what we would call a bar or *leap*.

36  
and the effects of contraction determined.

It was one great aim of the experiments of Michellotti and Bossut to determine the effects of contraction in these cases. Michellotti, after carefully observing the form and dimensions of the natural jet, made various mouth-pieces resembling it, till he obtained one which produced the smallest diminution of the computed discharge, or till the discharge computed for the area of its smaller end approached the nearest to the effective discharge. And he at last obtained one which gave a discharge of 985, when the natural discharge would have been 1000. This piece was formed by the revolution of a trochoid round the axis of the jet, and the dimensions were as follow:

Diameter of the outer orifice = 36  
inner orifice = 46  
Length of the axis = 96

The results of the experiments of the Abbé Bossut and of Michellotti scarcely differ, and they are expressed in the following table:

N or the natural expence	1000	27.78	V	Thrup
Q for the thin plate fig. A almost at the surface	6526	0.28	13	1/2
Q for ditto at the depth of 8 feet	6195	0.17	21	1/2
Q for ditto at the depth of 16 feet	6173	0.17	15	1/2
Q for a tube 2 diameters long, fig. B.	8125	0.22	57	1/2
Q for ditto projecting inwards and flowing full	6814	0.18	93	1/2
Q for ditto with a contracted jet, fig. C.	5137	0.14	27	1/2
Q for the mouth-piece, fig. D.	985	0.27	31	1/2
Q for a weir, fig. E.	9536	0.26	49	1/2
Q for a bar, fig. F.	9750	0.27	43	1/2

The number in the last column of this table, which are the cubical inches of water discharged in a second when the height  $h$  is one inch.

It must be observed that the discharge is diminished for the weir and bar table only to the extent of the diminution by the passage over the edge of the board. The weir may also suffer a diminution by the contraction at its two ends, if it is short enough to make the stream, which is generally supposed to be two feet in its continuity at least, to be interrupted. The contraction at the two ends is not the same, that at the edge of a thin plate being more than that at the edge of a tube. The contraction at the two ends may be introduced into the table, but the expence is the same in quantity whether it be the length of the waste-board or the weir.

In like manner, the diminution of discharge through a sluice could not be expressed here. The sluice is of discharge drawn up, but it never allows the water to flow through a the discharge is contracted at the top and at the bottom, and the diminution of discharge is not the same as in the case of a thin plate.

It is not only in the case of these contractions to the computation, but they are very easily observed. We frequently see a small stream of water issuing from a sluice into a small channel, and the edge of the stream, and then we see it contract, and then it is enlarged. When it is very small, the stream is completely broken into small drops. When the head of water is 4 or 50 inches, and runs off freely, the space left between it and the sides is about 1/4 inches. If the sides of the entry have a slope, this void space can never appear; but there is always this tendency to convergence, which diminishes the quantity of the discharge.

It will frequently abridge computation very much to consider the water discharged in these different situations as moving with a common velocity, which we consider as produced not by a fall from the surface of the fluid, which is exact only when the expence is equal to the natural expence, but by a fall  $h$  accommodated to the discharge; or it is convenient to know the height which would produce that very velocity which the water issues with in these situations.

And also, when the water is observed to be actually moving with a velocity  $V$ , and we know whether it is coming through a thin plate, through a tube, over a dam, &c. it is necessary to know that the pressure or HEAD OF WATER  $h$  which has actually produced this velocity. It is convenient therefore to have the following numbers in readiness:

Theory.

ing the progressive motion of an open stream, whose surface is not level, it is quite enough that we see that such a motion must obtain, and that we see that there are propelling forces; and that those forces arise solely from the want of a level surface, or from the slope of the surface; and that, with respect to any one particle, the force acting on it is proportional to the difference of level between each of the two columns (one on each side of the particle) which produce it. Were the surface level, there would be no motion; if it is not level, there will be motion; and this motion will be proportional to the want of level or the declivity of the surface: it is of no consequence whether the bottom be level or not, or what is its shape.

Hence we draw a fundamental principle, that the motion of rivers depends entirely on the slope of the surface.

The SLOPE or declivity of any inclined plane is not properly expressed by the difference of height alone of its extremities; we must also consider its length: and the measure of the slope must be such that it may be the same while the declivity is the same. It must therefore be the same over the whole of any one inclined plane. We shall answer these conditions exactly, if we take for the measure of a slope the fraction which expresses the elevation of one extremity above the other divided by the length of the plane. Thus  $\frac{AM}{AF}$  will express the declivity of the plane AF.

39  
When it is uniform the resistance is equal to the accelerating force.

If the water met with no resistance from the bed in which it runs, if it had no adhesion to its sides and bottom, and if its fluidity were perfect, its gravity would accelerate its course continually, and the earth and its inhabitants would be deprived of all the advantages which they derive from its numberless streams. They would run off so quickly, that our fields, dried up as soon as watered, would be barren and useless. No soil could resist the impetuosity of the torrents; and their accelerating force would render them a destroying scourge, were it not that, by kind Providence, the resistance of the bed, and the viscosity of the fluid, become a check which reins them in and sets bounds to their rapidity. In this manner the friction of the sides, which, by the viscosity of the water, is communicated to the whole mass, and the very adhesion of the particles to each other, and to the sides of the channel, are the causes which make the resistance bear a relation to the velocity; so that the resistances augmenting with the velocities, come at last to balance the accelerating force. Then the velocity now acquired is preserved, and the motion becomes uniform, without being able to acquire new increase, unless some change succeeds either in the slope or in the capacity of the channel. Hence arises the second maxim in the motion of rivers, that *when a stream moves uniformly, the resistance is equal to the accelerating force.*

As in the efflux of water through orifices, we pass over the very beginnings of the accelerated motion, which is a matter of speculative curiosity, and consider the motion in a state of permanency, depending on the head of water, the area of the orifice, the velocity, and the expence; so, in the theory of the uniform motion of river, we consider the slope, the transverse section or area of the stream, the uniform velocity, and the ex-

pence. It will be convenient to affix precise meanings to the terms which we shall employ.

The SECTION of a stream is the area of a plane perpendicular to the direction of the general motion.

The resistances arise ultimately from the action of the water on the internal surface of the channel, and must be proportional (*ceteris paribus*) to the extent of the action. Therefore if we unfold the whole edge of this section, which is rubbed as it were by the passing water, we shall have a measure of the extent of this action. In a pipe, circular or prismatical, the whole circumference is acted on; but in a river or canal ACQ (fig. 6.) the horizontal line  $aOe$ , which makes the upper boundary of the section  $aCD$ , is free from all action. The action is confined to the three lines  $aC$ ,  $CD$ ,  $De$ . We shall call this line  $aCD$  the *boundary* of the section.

The *mean velocity* is that with which the whole section, moving equally, would generate a solid equal to the expence of the stream. This velocity is to be found perhaps but in one instance of the former, and we do not know in which instance.

Since we are attempting to establish a general theory of the motion of rivers, founded on experiment and palpable demonstration, and since it is extremely difficult to make experiments on open streams which shall have a precise influence for such an important purpose—it would be a most desirable thing to demonstrate an exact analogy between the mutual balancing of the acceleration and resistance in pipes and in rivers; for in those we can not only make experiments with all the desired accuracy, and admitting precise measures, but we can make them in a number of cases that are almost impracticable in rivers. We can increase the slope of a pipe from running to the vertical position, and we can employ every degree of pressure, to ascertain its effect on the velocity in degrees which open streams will not admit. The Chevalier de Buat has most happily succeeded in this demonstration; and it is here that his good sense and his penetration have done so much service to practical science.

Let AB (fig. 7.) be a horizontal tube, through which the water is impelled by the pressure or elevation and DA. This head is the moving power, and it may be conceived as consisting of two parts, performing two distinct offices. One of them is employed in imparting on the water that velocity with which it *usually* moves in the tube. Were there no obstructions to this motion, no greater head would be wanted; but there are obstructions arising from friction, adhesion, and viscosity. This requires force. Let this be the office of the rest of the head of water in the reservoir. There is but one allotment, appropriation, or repartition, of the whole head which will answer. Suppose E to be the point of partition, so that DE is the head necessary for impressing the actual velocity on the water (a head or pressure which has a relation to the form or circumstance of the entry, and the contraction which takes place there). The rest EA is wholly employed in overcoming the simultaneous resistances which take place along the whole tube AB, and is in equilibrium with this resistance. Therefore if we apply at E a tube EC of the same length and diameter with AB, and

Theory.

40  
Terms precisely explained.

41  
The action of water in a horizontal tube.

**Theory.** and having the same degree of polish or roughness; and if this tube be inclined in such a manner that the axis of its extremity may coincide with the axis of AB in the point C—we affirm that the velocity will be the same in both pipes, and that they will have the same expence; for the moving force in the sloping pipe EC is composed of the whole weight of the column DE and the relative weight of the column EC; but this relative weight, by which alone it descends along the inclined pipe EC, is precisely equal to the weight of a vertical column EA of the same diameter. Every thing therefore is equal in the two pipes, viz. the lengths, the diameters, the moving forces, and the resistances; therefore the velocities and discharges will also be equal.

This is not only the case on the whole, but also in every part of it. The relative weight of any part of the column is precisely in equilibrio with the resistances along that part of the pipe; for it has the same proportion to the whole relative weight that the resistance has to the whole resistance. Therefore (and this is the most important circumstance, and the basis of the whole theory) the pipe EC may be cut shorter, or may be lengthened to infinity, without making any change in the velocity or expence. So long as the propelling head DE remains the same.

Letting the whole head DA as it is, if we lengthen the horizontal pipe AB to C, it is evident that we increase the resistance without any addition of force to overcome it. The velocity must therefore be diminished; and it will now be a velocity which is produced by a smaller head than DE; therefore if we were to put in a pipe of equal length at E, terminating in the horizontal line AC, the water will not run equally in both pipes. In order then to see we must discover the diminished velocity with which the water now actually runs along AC, and we must make a head DI capable of supporting this velocity at the entry of the pipe, and then insert at I a pipe IH of the same length with AB. The expence and velocity of both pipes will now be the same (A).

What has now been said of a horizontal pipe AB would have been equally true of any inclined pipe AB, A'B' (fig. 8.) Drawing the horizontal line CH, we see that DC is the whole head or propelling pressure for either pipe AB or A'B; and if DE is the head necessary for the actual velocity, EC is the head necessary for balancing the resistances; and the pipe EF of the same length with AB, and terminating in the same horizontal line, will have the same velocity; and its in-

clination being thus determined, it will have the same velocity and expence whatever be its length.

Thus we see that the motion in any pipe, horizontal or sloping, may be referred to or substituted for the motion in another inclined pipe, whose head of water above the place of entry, is that productive of the actual velocity of the water in the pipe. Now, in this case, the accelerating force is equal to the resistance: we may therefore consider this last pipe as a river, of which the bed and the slope are uniform or constant, and the current in a state of permanency; and we now may clearly draw this important conclusion, that pipes and open streams, when in a state of permanency, perfectly resemble each other in the circumstances which are the immediate causes of this permanency. The equilibrium between the accelerating force obtains not only in general, but takes place through the whole length of the pipe or stream, and is predicable of every individual transverse section of either. To make this more palpably evident if possible, let us consider a sloping cylindrical pipe, the current of which is in a state of permanency. We can conceive it as consisting of two half cylinders, an upper and a lower. These are running together at an equal pace; and the filaments of each immediately contiguous to the separating plane and to each other, are not rubbing on each other, nor affecting each others motions in the smallest degree. It is true that the upper half is pressing on the lower, but in a direction perpendicular to the motion, and therefore not affecting the velocity; and we shall see presently, that although the lower side of the pipe bears somewhat more pressure than the other, the resistances are not changed. (Indeed this odds of pressure is accompanied with a difference of motion, which need not be considered at present; and we may suppose the pipe so small or so far below the surface, that this shall be in-sensible). Now let us suppose, that in an instant the upper half cylinder is annihilated: We then have an open stream; and every circumstance of accelerating force and of resistance remains precisely as it was. The motion must therefore continue as it did; and in this state the only accelerating force is the slope of the surface. The demonstration therefore is complete.

From these observations and reasonings we draw a general and important conclusion, "That the same quantity of water will preserve uniform to any distance, according as it has different inclinations; and each inclination of a pipe of given diameter has a certain velocity peculiar to itself, which will be maintained uniform to any distance whatever;

L 1 a

whatever;

(A) We recommend it to the reader to make this distribution or allotment of the different portions of the pressure very familiar to his mind. It is of the most extensive influence in every question of hydraulics, and will on every occasion give him distinct conceptions of the internal procedure. Obvious as the thought seems to be, it has escaped the attention of all the writers on the subject. Lecchi, in his *Hydraulics* published in 1766, ascribes something like it to Daniel Bernouilli; but Bernouilli, in the passage quoted, only speaks of the partition of pressure in the instant of opening an orifice. Part of it, says he, is employed in accelerating the quiescent water, and producing the velocity of efflux, and the remainder produces the pressure (now diminished) on the sides of the vessel. Bernouilli, Bossut, and all the good writers, make this distribution in express terms in their explanation of the motion of water through successive orifices; and it is surprising that no one before the Chevalier de Buat saw that the resistance arising from friction required a similar partition of the pressure; but though we should call this good fortune, we must ascribe to his great sagacity and justness of conception the beautiful use that he has made of it: "*suum cuique.*"

Theory.

whatever, and this velocity increases continually according to some law, to be discovered by theory or experiment, as the position of the pipe changes, from being horizontal till it becomes vertical; in which position it has the greatest uniform velocity possible relative to its inclination or depending on inclination alone.

Let this velocity be called the *TRAIN*, or the *TRACTION* of each pipe.

45  
Measure of the resistance to the motion with a given velocity.

It is evident that this principle is of the utmost consequence in the theory of hydraulics; for by experiment we can find the train of any pipe. It is in train when an increase of length makes no change in the velocity. If lengthening the pipe increases the velocity, the slope of the pipe is too great, and vice versa. And having discovered the train of a pipe, and observed its velocity, and computed the head productive of this velocity with the contraction at the entry, the remainder of the head, that is, the slope (for this is equivalent to  $EA$ ), is the measure of the resistance. Thus we obtain the measure of the resistance to the motion with a given velocity in a pipe of given diameter. If we change only the velocity, we get the measure of the new resistance relative to the velocity; and thus discover the law of relation between the resistance and velocity. Then, changing only the diameter of the pipe, we get the measure of the resistance relative to the diameter. This is the aim of a prodigious number of experiments made and collected by Buat, and which we shall not repeat, but only give the results of the different parts of his investigation.

46  
Results of De Buat's investigation on this subject.

We may express the slope of a pipe by the symbol  $\frac{1}{f}$ , 1 being an inch for instance, and  $s$  being the slant length of a pipe which is one inch more elevated at one end than at the other. Thus a river which has a declivity of an inch and a half in 120 fathoms or 8640 inches, has its slope  $= \frac{1\frac{1}{2}}{8640}$ , or  $\frac{1}{5760}$ . But in order to obtain the hydraulic slope of a conduit pipe, the heights of the reservoir and place of discharge being given, we must subtract from the difference of elevation the height or head of water necessary for propelling the water into any pipe with the velocity  $V$ , which it is supposed actually to have. This is  $\frac{V^2}{505}$ . The remainder  $d$  is to be considered as the height of the declivity, which is to be distributed equally over the whole length  $l$  of the pipe, and the slope is then  $\frac{d}{l} = \frac{1}{f}$ .

There is another important view to be taken of the slope, which the reader should make very familiar to his thoughts. It expresses the proportion between the weight of the whole column which is in motion and the weight which is employed in overcoming the resistance; and the resistance to the motion of any column of water is equal to the weight of that column multiplied by the fraction  $\frac{1}{f}$ , which expresses its slope.

We come now to consider more particularly the resistances which in this manner bring the motions to a state of uniformity. If we consider the resistances which arise from a cause analogous to friction, we see they must depend entirely on the inertia of the

Theory.

water. What we call the resistance is the diminution of a motion which *would* have obtained but for these resistances; and the best way we have of measuring them is by the force which we must employ in order to keep up or restore this motion. We estimate this motion by a progressive velocity, which we measure by the expence of water in a given time. We judge the velocity to diminish, when the quantity discharged diminishes; yet it may be otherwise, and probably is otherwise. The absolute velocity of many, if not all, of the particles, may even be increased; but many of the motions, being transverse to the general direction, the quantity of motion in this direction may be less, while the sum of the absolute motions of all the particles may be greater. When we increase the general velocity, it is not unreasonable to suppose that the impulses on all the inequalities are increased in this proportion; and the number of particles thus impelled and deflected at the same time will increase in the same proportion. The whole quantity therefore of these useless and lost motions will increase in the duplicate ratio of the velocities, and the force necessary for keeping up the motion will do so also; that is, the resistances should increase as the squares of the velocities.

Or if we consider the resistance arising entirely from the curvature of the imperceptible internal motions occasioned by the inequalities of the sides of the pipe, and as measured by the forces necessary for producing these curvilinear motions; then, because the curves will be the same whatever are the velocities, the deflecting forces will be as the squares of the velocities; but these deflecting forces are pressure, propagated from the parts urged or pressed by the external force, and are proportional to these external pressures by the principles of hydrostatics. Therefore the pressures or forces necessary for keeping up the velocities are as the squares of these velocities; and they are our only measures of the resistances which must be considered as following the same ratio. Whatever view therefore we take of the nature of these resistances, we are led to consider them as proportional to the squares of the velocities.

We may therefore express the resistances by the symbol  $\frac{V^2}{m}$ ,  $m$  being some number to be discovered by experiment. Thus, in a particular pipe, the diminution of the motion or the resistance may be the reciprocal part of the square of the velocity, and  $R = \frac{V^2}{1000}$ .

Now if  $g$  be the accelerating power of gravity on any particle,  $\frac{g}{f}$  will be its accelerating power, by which

it would urge it down the pipe whose slope is  $\frac{1}{f}$ . Therefore, by the principle of uniform motion, the equality of the accelerating force, and the resistance, we shall have  $\frac{V^2}{m} = \frac{g}{f}$ , and  $V \sqrt{f} = \sqrt{mg}$ ; that is, the product of the velocity, and the reciprocal of the square root of the slope, or the quotient of the velocity divided by the slope, is a constant quantity  $\sqrt{mg}$  for any given pipe; and the primary formula for all the uniform velocities of one pipe is  $V = \frac{\sqrt{mg}}{\sqrt{f}}$ .

## Theory.

48

Experiments and reasoning of De Buat, respecting these resistances, &c.

Mr Buat therefore examined this by experiment, but found, that even with respect to a pipe or channel which was uniform throughout, this was not true. We could give at once the final formula which he found to express the velocity in every case whatever; but this would be too empirical. The chief steps of his very sagacious investigation are instructive. We shall therefore mention them briefly, at least as far as they tend to give us any collateral information; and let it always be noted, that the instruction which they convey is not abstract speculation, but experimental truths, which must ever remain as an addition to our stock of knowledge, although Mr Buat's deductions from them should prove false.

He found, in the first place, that in the same channel the product of  $V$  and  $\sqrt{s}$  increased as  $\sqrt{s}$  increased; that is, the velocities increased faster than the square roots of the slope, or the resistances did not increase as fast as the squares of the velocities. We have to refer our readers to what we said on the resistance of pipes to the motion of fluids through them, in the article *HYDRAULICS*, when speaking of bellows. They will find for very valid reasons (we apprehend) for thinking that the resistances must increase more slowly than the squares of the velocities.

It being found, then, that  $V\sqrt{s}$  is not equal to a constant quantity  $\sqrt{mg}$ , it becomes necessary to investigate some quantity depending on  $\sqrt{s}$ , or, as it is called, some function of  $\sqrt{s}$ , which shall render  $V\sqrt{s}$  a constant quantity. Let  $X$  be this function of  $\sqrt{s}$ , so that we shall always have  $VX$  equal to the constant quantity  $\sqrt{mg}$ , or  $V = \frac{\sqrt{mg}}{X}$  equal to the actual velocity  $V$  of a pipe or channel which is in train.

Mr Buat, after many trials and reflections, the chief of which will be mentioned by and by, found a value of  $X$  which corresponded with a vast variety of slopes and velocities, from motions almost imperceptible, in a bed nearly horizontal, to the greatest velocities which could be produced by gravity alone in a vertical pipe; and when he compared them together, he found a very discernible relation between the resistances and the magnitude of the section: that is, that in two channels which had the same slope, and the same propelling force, the velocity was greatest in the channel which had the greatest section relative to its border. This may reasonably be expected. The resistances arise from the mutual action of the water and this border. The water immediately contiguous to it is retarded, and this retards the next, and so on. It is to be expected, therefore, that if the border, and the velocity, and the slope, be the same, the diminution of this velocity will be so much the less as it is to be shared among a greater number of particles; that is, as the area of the section is greater in proportion to the extent of its border. The diminution of the general or medium velocity must be less in a cylindrical pipe than in a square one of the same area, because the border of its section is less.

It appears evident, that the resistance of each particle is in the direct proportion of the whole resistance, and the inverse proportion of the number of particles which receive equal shares of it. It is therefore directly as the

border, and inversely as the section. Therefore in the

expression  $\frac{V^2}{m}$  which we have given for the resistance,

the quantity  $m$  cannot be constant, except in the same channel; and in different channels it must vary along with the relation of the section to its border, because the resistances diminish in proportion as this relation increases.

Without attempting to discover this relation by theoretical examination of the particular motions of the various filaments, Mr Buat endeavoured to discover it by a comparison of experiments. But this required some manner of stating this proportion between the augmentation of the section and the augmentation of its border.

His statement is this: He reduces every section to a rectangular parallelogram of the same area, and having its base equal to the border unfolded into a straight line. The product of this base by the height of the rectangle will be equal to the area of the section. Therefore this height will be a representative of this variable ratio of the section to its border. (We do not mean that there is any ratio between a surface and a line: but the ratio of section to section is different from that of border to border; and it is the ratio of these ratios which is thus expressed by the height of this rectangle). If  $S$  be the section, and  $B$  the border,

$\frac{S}{B}$  is evidently a line equal to the height of this rectangle. Every section being in this manner reduced to a rectangle, the perpendicular height of it may be called the *HYDRAULIC MEAN DEPTH* of the section, and may be expressed by the symbol  $d$ . (Buat calls it the mean radius). If the channel be a cylindrical pipe, or an open half cylinder, it is evident that  $d$  is half the radius. If the section is a rectangle, whose width is  $w$ , and height  $h$ , the mean depth is  $\frac{wh}{b+2h}$ , &c. In general, if  $q$  represent the proportion of the breadth of a rectangular canal to its depth, that is, if  $q$  be made  $= \frac{w}{h}$ , we shall

have  $d = \frac{w}{q+2}$ , or  $d = \frac{qb}{q+2}$ .

Now, since the resistances must augment as the proportion of the border to the section augment,  $m$  in the formulas  $\frac{V^2}{m} = \frac{g}{s}$  and  $V\sqrt{s} = \sqrt{mg}$ , must follow the proportions of  $d$ , and the quantity  $\sqrt{mg}$  must be proportional to  $\sqrt{a}$  for different channels, and  $\frac{V^2}{m} = \frac{g}{s}$

should be a constant quantity in every case.

Our author was aware, however, of a very specious objection to the close dependence of the resistance on the extent of the border; and that it might be said that a double border did not occasion a double resistance, unless the pressure on all the parts was the same. For it may be naturally (and it is generally) supposed, that the resistance will be greater when the pressure is greater. The friction or resistance analogous to friction may therefore be greater on an inch of the bottom than on an inch of the sides; but Mr D'Alembert and many others have demonstrated, that the paths of the filaments will be the same whatever be the pressure.

This

Theory.

50  
Obviated  
by an ex-  
periment  
on the of-  
fset of  
water in  
syphons.

This might serve to justify our ingenious author; but he was determined to rest every thing on experiment. He therefore made an experiment on the oscillation of water in syphons, which is affected by the same circumstances, and is susceptible of much greater precision, and of more extensive and important application.

The two vessels ABCD, *abcd* (fig. 9.) were connected by the syphon EFG *gfe*, which passed round in the short tubes E and e, without allowing any water to escape; the axes of these tubes being in one straight line. The vessels were about 10 inches deep, and the branches FG, *fg* of the syphon were about five feet long. The vessels were set on two tables of equal height, and (the hole *e* being stopped) the vessel ABCD, and the whole syphon, were filled with water, and water was poured into the vessel *abcd* till it stood at a certain height LM. The syphon was then turned into a horizontal position, and the plug drawn out of *e*, and the time carefully noted which the water employed in rising to the level HK *kh* in both vessels. The whole apparatus was now inclined, so that the water run back into ABCD. The syphon was now put in a vertical position, and the experiment was repeated. — No sensible or regular difference was observed in the time. Yet in this experiment the pressure on the part G *g* of the syphon was more than six times greater than before. As it was thought that the friction on this small part (only six inches) was too small a portion of the whole obstruction, various additional obstructions were put into this part of the syphon, and it was even lengthened to nine feet; but still no remarkable difference was observed. It was even thought that the times were less when the syphon was vertical.

51  
The resist-  
ance de-  
pends chief-  
ly on the  
relation be-  
tween the  
section and  
its border.

Thus M. De Buat's opinion is completely justified; and he may be allowed to assert, that the resistance depends chiefly on the relation between the section and its border; and that  $\frac{\sqrt{mg}}{\sqrt{d}}$  should be a constant quantity.

To ascertain this point was the object of the next series of experiments; to see whether this quantity was really constant, and, if not, to discover the law of its variation, and the physical circumstances which accompanied the variations, and may therefore be considered as their causes. A careful comparison of a very great number of experiments, made with the same slope, and with very different channels and velocities, showed that  $\sqrt{mg}$  did not follow the proportion of  $\sqrt{d}$ , nor of any power of  $\sqrt{d}$ . This quantity  $\sqrt{mg}$  increased by smaller degrees in proportion as  $\sqrt{d}$  was greater. In very great beds  $\sqrt{mg}$  was nearly proportional to  $\sqrt{d}$ , but in smaller channels, the velocities diminished much more than  $\sqrt{d}$  did. Casting about for some way of accommodation M. Buat considered, that some approximation at least would be had by taking off from  $\sqrt{d}$  some constant small quantity. This is evident; for such a diminution will have but a trifling effect when  $\sqrt{d}$  is great, and its effect will increase rapidly when  $\sqrt{d}$  is very small. He therefore tried various values for this subtraction, and compared the results with the former experiments; and he found, that if in

Theory.

every case  $\sqrt{d}$  be diminished by one-tenth of an inch, the calculated discharges would agree very exactly with the experiment. Therefore, instead of  $\sqrt{d}$ , he makes use of  $\sqrt{d}-0.1$ , and finds this quantity always pro-

portional to  $\sqrt{mg}$ , or finds that  $\frac{\sqrt{mg}}{\sqrt{d}-0.1}$  is a constant quantity, or very nearly so. It varied from 297 to 287 in all sections from that of a very small pipe to that of a little canal. In the large sections of canals and rivers it diminished still more, but never was less than 256.

This result is very agreeable to the most distinct no-<sup>52</sup> The result agreeable to our distinct notions of the mutual actions of the water and its bed. We see, that when the motion of water is obstructed by a solid body, which deflects the passing filaments, the disturbance does not extend to any considerable distance on the two sides of the body. In like manner, the small disturbances, and imperceptible curvilinear motions, which are occasioned by the infinitesimal inequalities of the channel, must extend to a very small distance indeed from the sides and bottom of the channel. We know, too, that the mutual adhesion or attraction of water for the solid bodies which are moistened by it, extends to a very small distance; which is probably the same, or nearly so, in all cases. M. Buat observed, that a surface of 23 square inches, applied to the surface of stagnant water, lifted 1601 grains; another of 54 square inches lifted 167: this was at the rate of 65 grains per inch nearly, making a column of about one-sixth of an inch high. Now this effect is very much analogous to a real contraction of the capacity of the channel. The water may be conceived as nearly stagnant to this small distance from the border of the section. Or, to speak more accurately, the diminution of the progressive velocity occasioned by the friction and adhesion of the sides, decreases very rapidly as we recede from the sides, and ceases to be sensible at a very small distance.

The writer of this article verified this by a very simple<sup>53</sup> And con- and instructive experiment. He was making experiments on the production of vortices, in the manner suggested by Sir Isaac Newton, by whirling a very accurate and smoothly polished cylinder in water; and he found that the rapid motion of the surrounding water was confined to an exceeding small distance from the cylinder, and it was not till after many revolutions that it was sensible even at the distance of half an inch. We may, by the way, suggest this as the best form of experiments for examining the resistances of pipes. The motion excited by the whirling cylinder in the stagnant water is equal and opposite to the motion lost by water passing along a surface equal to that of the cylinder with the same velocity. Be this as it may, we are justified in considering, with M. Buat, the section of the stream as thus diminished by cutting off a narrow border all round the touching parts, and supposing that the motion and discharge is the same as if the root of the mean depth of the section were diminished by a small quantity, nearly constant. We see, too, that the effect of this must be insensible in great canals and rivers; so that, fortunately, its quantity is best ascertained by experiments made with small pipes. This is attended with another convenience, in the opinion of M. Buat, namely, that the effect

Theory. effect of viscosity is most sensible in great masses of water in flow motion, and is almost insensible in small pipes, so as not to disturb these experiments. We may therefore assume 297 as the general value of

$$\frac{\sqrt{mg}}{\sqrt{d-0.1}}$$

Since we have  $\frac{\sqrt{mg}}{\sqrt{d-0.1}} = 297$ , we have also

$$m = \frac{297^2}{g} \sqrt{d-0.1}^2 = \frac{88209}{362} (\sqrt{d-0.1})^2 =$$

$$243.7 (\sqrt{d-0.1})^2. \text{ This we may express by } n (\sqrt{d-0.1})^2. \text{ And thus, when we have expressed}$$

the effect of friction by  $\frac{V^2}{m}$ , the quantity  $m$  is vari-

able, and its general value is  $\frac{V^2}{n (\sqrt{d-0.1})^2}$ , in which

$n$  is an invariable abstract number equal to 243.7, given by the nature of the resistance which water sustains from its bed, and which indicates its intensity.

And, lastly, since  $m = n (\sqrt{d-0.1})^2$ , we have

$\sqrt{mg} = \sqrt{n g} (\sqrt{d-0.1})$ , and the expression of the velocity  $V$ , which water acquires and maintains along any channel whatever, now becomes  $V =$

$$\frac{\sqrt{n g} (\sqrt{d-0.1})}{X}, \text{ or } \frac{297 (\sqrt{d-0.1})}{X}, \text{ in which}$$

$X$  is also a variable quantity, depending on the slope of the surface or channel, and expressing the accelerating force which, in the case of water in train, is in equilibrium with the resistances expressed by the numerator of the fraction.

54  
Law of acceleration investigated.

Having so happily succeeded in ascertaining the variations of resistance, let us accompany Mr Buat in his investigation of the law of acceleration, expressed by the value of  $X$ .

Experience, in perfect agreement with any distinct opinions that we can form on this subject, had already showed him, that the resistances increased in a slower ratio than that of the squares of the velocities, or that the velocities increased slower than  $\sqrt{r}$ . Therefore,

in the formula  $V = \frac{\sqrt{n g} (\sqrt{d-0.1})}{X}$ , which, for one

channel, we may express thus,  $V = \frac{A}{X}$ , we must admit

that  $X$  is sensibly equal to  $V^2$ , when the slope is very small or very great. But, that we may accurately express the velocity in proportion as the slope augments, we must have  $X$  greater than  $V^2$ ; and moreover,

$\frac{V^2}{X}$  must increase as  $V^2$  diminishes. These conditions are necessary, that our values of  $V$ , deduced from

the formula  $V = \frac{A}{X}$ , may agree with the experiment.

In order to comprehend every degree of slope, we must particularly attend to the motion through pipes, because open canals will not furnish us with instances of exact TRAINS with great slopes and velocities. We

can make pipes vertical. In this case  $\frac{1}{s}$  is  $\frac{1}{1}$ , and the velocity is the greatest possible for a train by the action of gravity: But we can give greater velocities than this

by increasing the head of water beyond what produces the velocity of the train. Theory.

Let AB (fig. 10.) be a vertical tube, and let CA be the head competent to the velocity in the tube, which we suppose to be in train. The slope is 1, and the full weight of the column in motion is the precise

measure of the resistance. The value of  $\frac{1}{s}$ , considered

as a slope, is now a maximum; but, considered as expressing the proportion of the weight of the column in motion to the weight which is in equilibrio with the

resistance, it may not be a maximum; it may surpass unity, and  $s$  may be less than 1. For if the vessel be

filled to E, the head of water is increased, and will produce a greater velocity, and this will produce a

greater resistance. The velocity being now greater, the head EF which imparts it must be greater than

CA. But it will not be equal to EA, because the uniform velocities are found to increase faster than the square roots of the pressures. This is the general fact.

Therefore F is above A, and the weight of the column FB, now employed to overcome the resistance, is greater than the weight of the column AB in motion.

In such cases, therefore,  $\frac{1}{s}$ , greater than unity, is a sort

of fictitious slope, and only represents the proportion of the resistance to the weight of the moving column.

This proportion may surpass unity.

But it cannot be infinite: For supposing the head of water infinite; if this produce a finite velocity, and we deduct from the whole height the height corresponding to this finite velocity, there will remain an infinite head, the measure of an infinite resistance produced by a finite velocity. This does not accord with

the observed law of the velocities, where the resistances actually do not increase as fast as the squares of the velocities. Therefore an infinite head would have

produced an infinite velocity, in opposition to the resistances: taking off the head of the tube, competent to this velocity, at the entry of the tube, which head would also be infinite, the remainder would in all probability be finite, balancing a finite resistance.

Therefore the value of  $s$  may remain finite, although the velocity be infinite; and this is agreeable to all our clearest notions of the resistances.

Adopting this principle, we must find a value of  $X$  which will answer all these conditions. 2. It must be sensibly proportional to  $V^2$ , while  $s$  is great. It must

always be less than  $V^2$ . 3. It must deviate from the proportion of  $V^2$ , so much the more as  $V^2$  is smaller.

4. It must not vanish when the velocity is infinite. 5. It must agree with a range of experiments with every variety of channel and of slope.

We shall understand the nature of this quantity  $X$  better by representing by lines the quantities concerned in forming it.

If the velocities were exactly as the square roots of the slopes, the equilateral hyperbola NKS (fig. 10. N° 2.) between its asymptotes MA, AB, would represent

the equation  $V = \frac{A}{\sqrt{s}}$ . The values of  $\sqrt{s}$  would be represented by the abscissæ, and the velocities by the ordinates, and  $V \sqrt{s} = A$  would be the power of the hyperbola. But since these velocities are not sensibly

Theory.

equal to  $\frac{A}{\sqrt{s}}$  except when  $\sqrt{s}$  is very great, and deviate

the more from this quantity as  $\sqrt{s}$  is smaller; we may represent the velocities by the ordinates of another curve  $PGT$ , which approaches very near to the hyperbola, at a great distance from  $A$  along  $AB$ ; but separates from it when the abscissæ are smaller; so that if  $AQ$  represents that value of  $\sqrt{s}$  (which we have seen may become less than unity), which corresponds to an infinite velocity, the line  $QO$  may be the asymptote of the new curve. Its ordinates are equal to  $\frac{A}{X}$  while

those of the hyperbola are equal to  $\frac{A}{\sqrt{s}}$ . Therefore

the ratio of these ordinates or  $\frac{\sqrt{s}}{X}$  should be such that it shall be so much nearer to unity as  $\sqrt{s}$  is greater, and shall surpass it so much the more as  $\sqrt{s}$  is smaller.

To express  $X$  therefore as some function of  $\sqrt{s}$  so as to answer these conditions, we see in general that  $X$  must be less than  $\sqrt{s}$ . And it must not be equal to any power of  $\sqrt{s}$  whose index is less than unity, because then  $\frac{\sqrt{s}}{X}$  would differ so much the more from uni-

ty as  $\sqrt{s}$  is greater. Nor must it be any multiple of  $\sqrt{s}$  such as  $q\sqrt{s}$ , for the same reason. If we make  $X = \sqrt{s} - K$ ,  $K$  being a constant quantity, we may answer the first condition pretty well. But  $K$  must be very small, that  $X$  may not become equal to nothing, except in some exceedingly small value of  $\sqrt{s}$ . Now the experiments will not admit of this, because the ratio

$\frac{\sqrt{s}}{\sqrt{s} - K}$  does not increase sufficiently to correspond with the velocities which we observe in certain slopes, unless we make  $K$  greater than unity, which again is inconsistent with other experiments. We learn from such canvassing that it will not do to make  $K$  a constant quantity. If we should make it any fractionary power of  $\sqrt{s}$ , it would make  $X = 0$ , that is, nothing, when  $s = 1$ , which is also contrary to experience. It would seem, therefore, that nothing will answer for  $K$  but some power of  $\sqrt{s}$  which has a variable index. The logarithm of  $\sqrt{s}$  has this property. We may therefore try to make  $X = \sqrt{s} - \log. \sqrt{s}$ . Accordingly if we try

the equation  $V = \frac{A}{\sqrt{s} - \text{hyp. log. } \sqrt{s}}$ , we shall find a very great agreement with the experiments till the declivity becomes considerable, or about  $\frac{1}{4}$ , which is much greater than any river. But it will not agree with the velocities observed in some mill courses, and in pipes of a still greater declivity, and gives a velocity that is too small; and in vertical pipes the velocity is not above one half of the true one. We shall get rid of most of these incongruities if we make  $K$  consist of the hyperbolic logarithm of  $\sqrt{s}$  augmented by a small constant quantity, and by trying various values for this constant quantity, and comparing the results with experiment, we may hit on one sufficiently exact for all practical purposes.

M. De Buat, after repeated trials, found that he would have a very great conformity with experiment

by making  $K = \log. \sqrt{s} + 1,6$ , and that the velocities exhibited in his experiments would be very well repre-

sented by the formula  $V = \frac{297(\sqrt{s} - 0,1)}{\sqrt{s} - \log. \sqrt{s} + 1,6}$ .

There is a circumstance which our author seems to have overlooked on this occasion, and which is undoubtedly of great effect in these motions, viz. the mutual adhesion of the particles of water. This causes the water which is descending (in a vertical pipe for example) to drag more water after it, and thus greatly increases its velocity. We have seen an experiment in which the water issued from the bottom of a reservoir through a long vertical pipe having a very gentle taper: it was 15 feet long, one inch diameter at the upper end, and two inches at the lower. The depth of the water in the reservoir was exactly one foot; in a minute there were discharged 2,2 cubic feet of water. It must therefore have issued through the hole in the bottom of the reservoir with the velocity of 8,85 feet per second. And yet we know that this head of water could not make it pass through the hole with a velocity greater than 6,56 feet per second. This increase must therefore have arisen from the cause we have mentioned, and is a proof of the great intensity of this force. We doubt not but that the discharge might have been much more increased by proper contrivances, and we know many instances in water pipes where this effect is produced in a very great degree.

The following case is very distinct: Water is brought into the town of Dunbar in the county of East Lothian from a spring at the distance of about 3200 yards. It is conveyed along the first 1100 yards in a pipe of two inches diameter, and the declivity is 12 feet nine inches; from thence the water flows in a pipe of 1 inch diameter, with a declivity of 44 feet 3 inches, making in all 57 feet. When the work was carried as far as the two-inch pipe reached, the discharge was found to be 27 Scotch pints, of 103 cubic inches each, in a minute. When it was brought into the town, the discharge was 28. Here it is plain that the descent along the second stretch of the pipe could derive no impulsion from the first. This was only able to supply 27 pints, and to deliver it into a pipe of equal bore. It was not equivalent to the forcing it into a smaller pipe, and almost doubling its velocity. It must therefore have been dragged into this smaller pipe by the weight of what was descending along it, and this water was exerting a force equivalent to a head of 16 inches, increasing the velocity from 14 to about 28.

It must be observed, that if this formula be just, there can be no declivity so small that a current of water will not take place in it. And accordingly none has been observed in the surface of a stream when this did not happen. But it also should happen with respect to any declivity of bottom. Yet we know that water will hang on the sloping surface of a board without proceeding further. The cause of this seems to be the adhesion of the water combined with its viscosity. The viscosity of a fluid presents a certain force which must be overcome before any current can take place.

A series of important experiments were made by our author in order to ascertain the relation between the velocity at the surface of any stream and that at the

Theory.

55  
Mutual adhesion of the particles of water.

56  
An actual

57  
proves that the smallest declivity will produce a current.

**Theory.** the bottom. These are curious and valuable on many accounts. One circumstance deserves our notice here, viz. that the difference between the superficial and bottom velocities of any stream are proportional to the square roots of the superficial velocities. From what has been already said on the gradual diminution of the velocities among the adjoining filaments, we must conclude that the same rule holds good with respect to the velocity of separation of two filaments immediately adjoining. Hence we learn that this velocity of separation is in all cases indefinitely small, and that we may, without danger of any sensible error, suppose it a constant quantity in all cases.

58 A constant part of the accelerating force employed in overcoming the viscosity, &c.

We think, with our ingenious author, that on a review of these circumstances, there is a constant or invariable portion of the accelerating force employed in overcoming this viscosity and producing this mutual separation of the adjoining filaments. We may express this part of the accelerating force by a part  $g$  of that

slope which constitutes the whole of it. If it were not employed in overcoming this resistance, it would produce a velocity which (on account of this resistance) is not produced, or is lost. This would be  $\frac{A}{\sqrt{S-L}\sqrt{S}}$ .

This must therefore be taken from the velocity exhibited by our general formula. When thus corrected, it

would become  $V = (\sqrt{d}-0,1) \left( \frac{\sqrt{ng}}{\sqrt{S-L}\sqrt{S}+1,6} \right)$

But as the term  $\frac{\sqrt{ng}}{\sqrt{S-L}\sqrt{S}}$  compounded only of constant quantities, we may express it by a single number. This has been collected from a scrupulous attention to the experiments (especially in canals and great bodies of water moving with very small velocities; in which case the effects of viscosity must become more remarkable), and it appears that it may be valued at  $\frac{1}{10,09}$ , or 0,3 inches very nearly.

From the whole of the foregoing considerations, drawn from nature, supported by such reasoning as our most distinct notions of the internal motions will admit, and authorised by a very extensive comparison with experiment, we are now in a condition to conclude a complete formula, expressive of the uniform motion of water, and involving every circumstance which appears to have any share in the operation.

Therefore let

59 Formula expressing the uniform motion of water.

$V$  represent the mean velocity, in inches per second, of any current of water, running uniformly, or which is in TRAIN, in a pipe or open channel, whose section, figure, and slope, are constant, but its length indefinite.

$d$  The hydraulic mean depth, that is, the quotient arising from dividing the section of the channel, in square inches, by its border, expressed in linear inches.

$S$  The slope of the pipe, or of the surface of the current. It is the denominator of the fraction expressing this slope, the numerator being always unity; and is had by dividing the expanded length of the pipe or

VOL. XVI. Part I.

channel by the difference of height of its two extremities. **Theory.**

$g$  The velocity (in inches per second) which a heavy body acquires by falling during one second.

$n$  An abstract constant number, determined by experiment to be 243,7.

$L$  the hyperbolic logarithm of the quantity to which it is prefixed, and is had by multiplying the common logarithm of that quantity by 2,3026.

We shall have in every instance

$$V = \frac{\sqrt{ng}(\sqrt{d}-0,1)}{\sqrt{S-L}\sqrt{S}+1,6} - 0,3(\sqrt{d}-0,1)$$

This, in numbers, and English measure, is

$$V = \frac{307(\sqrt{d}-0,1)}{\sqrt{S-L}\sqrt{S}+1,6} - 0,3(\sqrt{d}-0,1)$$

And in French measure

$$V = \frac{207(\sqrt{d}-0,1)}{\sqrt{S-L}\sqrt{S}+1,6} - 0,3(\sqrt{d}-0,1)$$

The following table contains the real experiments from which this formula was deduced, and the comparison of the real velocities with the velocities computed by the formula. It consists of two principal sets of experiments. The first are those made on the motion of water in pipes. The second are experiments made on open canals and rivers. In the first set, column 1st contains the number of the experiment; 2d, the length of the tube; 3d, the height of the reservoir; 4th, the values of  $S$ , deduced from column second and third; 5th gives the observed velocities; and 6th the velocities calculated by the formula.

In the second set, column 2d gives the area of the section of the channel; 3d, the border of the canal or circumference of the section, deducting the horizontal width, which sustains no friction; 4th, the square root  $\sqrt{d}$  of the hydraulic mean depth; 5th, the denominator  $S$  of the slope; 6th, the observed mean velocities; and 7th, the mean velocities by the formula. In the last ten experiments on large canals and a natural river the 6th column gives the observed velocities at the surface.

This comparison must be acknowledged to be most satisfactory, and shows the great penetration and address of the author, in so successfully lifting and appreciating the share which each co-operating circumstance has had in producing the very intricate and complicated effect. It adds some weight to the principles on which he has proceeded in this analysis of the mechanism of hydraulic motions, and must give us great confidence in a theory so fairly established on a very copious induction. The author offers it only as a rational and well-founded probability. To this character it is certainly entitled; for the suppositions made in it are agreeable to the most distinct notions we can form of these internal motions. And it must always be remembered that the investigation of the formula, although it be rendered somewhat more perspicuous by thus having recourse to those notions, has no dependence on the truth of the principles. For it is, in fact, nothing but a classification of experiments, which are grouped together by some one circumstance of slope, velocity, form of section, &c. in order to discover the law of the changes which are induced by a variation of the circumstances which do not resemble. The procedure was precisely similar to that of the astronomer when he deduces the elements of an orbit from a multitude of observations. This was the task of Mr de Buat; and he candidly and modestly informs us, that the finding out analytical forms of expression which could exhibit these changes was the work of Mr Benzech de St Honoré, a young officer of engineers, and his colleague in the experimental course. It does honour to his skill and address; and we think the whole both a pretty and instructive specimen of the method of discovering the laws of nature in the midst of complicated phenomena. Daniel Bernouilli first gave the rules of this method, and they have been greatly improved by Lambert, Condorcet, and De la Grange. Mr Coulomb has given some excellent examples of their application to the discovery of the laws of friction, of magnetical and electrical attraction, &c. But this present work is the most perspicuous and familiar of them all. It is the empirical method of generalizing natural phenomena, and of deducing general rules, of which we can give no other demonstration but that they are faithful representations of matters of fact. We hope that others, encouraged by the success of Mr de Buat, will follow this example, where public utility is preferred to a display of mathematical knowledge.

Although the author may not have hit upon the precise *modus operandi*, we agree with him in thinking that nature seems to act in a way not unlike what is here supposed. At any rate, the range of experiments is so extensive, and so multifarious, that few cases can occur which are not included among them. The experiments will always retain their value (as we presume that they are faithfully narrated), whatever may become of the theory; and we are confident that the formula will give an answer to any question to which it may be applicable infinitely preferable to the vague guesses of the most sagacious and experienced engineer.

We must however observe, that as the experiments on pipes were all made with scrupulous care in the contrivance and execution of the apparatus, excepting only those of Mr Couplet on the main pipes at Versailles,

Theory. we may presume that the formula gives the greatest velocities which can be expected. In ordinary works, where joints are rough or leaky, where drops of solder hang in the inside, where cocks intervene with deficient water-ways, where pipes have awkward bendings, contractions, or enlargements, and where they may contain sand or air, we should reckon on a smaller velocity than what results from our calculation; and we presume that an undertaker may with confidence promise  $\frac{2}{3}$  of this quantity without any risk of disappointing his employer. We imagine that the actual performance of canals will be much nearer to the formula.

63  
The velocity given by the formula too large for ordinary works.

We have made inquiry after works of this kind executed in Britain, that we might compare them with the formula. But all our canals are locked and without motion; and we have only learned by an accidental information from Mr Watt, that a canal in his neighbourhood, which is 18 feet wide at the surface, and seven feet at the bottom, and four feet deep, and has a slope of one inch in a quarter of a mile, runs with the velocity of 17 inches per second at the surface, 10 at the bottom, and 14 in the middle. If we compute the motion of this canal by our formula, we shall find the mean velocity to be 13  $\frac{1}{2}$ .

No river in the world has had its motions so much scrutinized as the Po about the end of the last century. It had been a subject of 100 years continual litigation between the inhabitants of the Bolognese and the Ferrarese, whether the waters of the Rheno should be thrown into the Tronco de Venezia or Po Grande. This occasioned very numerous measures to be taken of its sections and declivity, and the quantities of water which it contained in its different states of fullness. But, unfortunately, the long established methods of measuring waters, which were in force in Lombardy, made no account of the velocity, and not all the entreaties of Castelli, Grandi, and other moderns, could prevail on the visitors in this process to deviate from the established methods. We have therefore no minute accounts of its velocity, though there are many rough estimates to be met with in that valuable collection published at Florence in 1723, of the writings on the motion of rivers. From them we have extracted the *only precise observations* which are to be found in the whole work.

64  
Observations on the velocity of the Po.

The Po Grande receives no river from Stellata to the sea, and its slope in that interval is found most surprisingly uniform, namely six inches in the mile (reduced to English measure). The breadth in its great freshes is 750 feet at Lago Scuro, with a very uniform depth of 31 feet. In its lowest state (in which it is called *Po Magra*), its breadth is not less than 700 and its depth about 10  $\frac{1}{2}$ .

The Rheno has a uniform declivity from the Ponte Emilio to Vigarano of 15 inches per mile. Its breadth in its greatest freshes is 180 feet, and its depth 9.

Signor Corade in his report says, that in the state of the great freshes the velocity of the Rheno is most exactly  $\frac{2}{3}$  of that of the Po.

Grandi says that a great fresh in the Rheno employs 12 hours (by many observations of his own) to come from Ponte Emilio to Vigarano, which is 30 miles. This is a velocity of 44 inches per second. And, by Corade's proportion, the velocity of the Po Grande must be 55 inches per second.

Montanari's observation gives the Po Magra a velocity of 31 inches per second.

Let us compare these velocities with the velocities calculated by Buat's formula.

The hydraulic mean depths  $d$  and  $D$  of the Rheno and Po in the great freshes deduced from the above measures, are 98,6 and 344 inches; and their slopes  $s$  and  $S$  are  $\frac{1}{1632}$  and  $\frac{1}{10760}$ . This will give

$$\frac{307(\sqrt{D}-0,1)}{\sqrt{S}-L\sqrt{S}+1,6}-0,3(\sqrt{D}-0,1)=52,176 \text{ inches}$$

$$\text{and } \frac{307(\sqrt{d}-0,1)}{\sqrt{s}-L\sqrt{s}+1,6}-0,3(\sqrt{d}-0,1)=46,727 \text{ inches}$$

These results differ very little from the velocities above mentioned. And if the velocity corresponding to a depth of 31 feet be deduced from that observed by Montanari in the Po Magra 10 feet deep, on the supposition that they are in the proportion of  $\sqrt{d}$ , it will be found to be about 53  $\frac{1}{2}$  inches per second.

This comparison is therefore highly to the credit of the theory, and would have been very agreeable to the credit of the theory had he known it, as we hope it is to our readers.

We have collected many accounts of water pipes, and made the comparisons, and we flatter ourselves that these have enabled us to improve the theory. They shall appear in their proper place; and we may just observe here, that the two-inch pipe, which we formerly spoke of as conveying the water to Dunbar, should have yielded only 25  $\frac{1}{2}$  Scotch pints per minute by the formula, instead of 27; a small error.

We have, therefore, no hesitation in saying that this single formula of the uniform motion of water is one of the most valuable presents which natural science and the arts have received during the course of this century.

We hoped to have made this fortunate investigation of the chevalier de Buat still more acceptable to our readers by another table, which should contain the values of

$$\frac{307}{\sqrt{S}-L\sqrt{S}+1,6}$$

ready calculated for every declivity that can occur in water pipes, canals, or rivers. Aided by this, which supersedes the only difficult part of the computation, a person could calculate the velocity for any proposed case in less than two minutes. But we have not been able to get it ready for its appearance in this article, but we shall not fail to give it when we resume the subject in the article *Water-Works*; and we hope even to give its results on a scale which may be carried in the pocket, and will enable the unlearned practitioner to solve any question with accuracy in half a minute.

We have now established in some measure a THEORY OF HYDRAULICS, by exhibiting a general theorem which expresses the relation of the chief circumstances of all such motions as have attained a state of permanency, in so far as this depends on the magnitude, form, and slope of the channel. This permanency we have expressed by the term *RAIN*, saying that the stream is in train.

We proceed to consider the subordinate circumstances contained in this theorem; such as, 1 $^{\text{st}}$ , The forms which nature or art may give the bed of a running stream, and the manner of expressing this form in our theorem. 2 $^{\text{d}}$ , The gradations of the velocity, by which it

**Theory.** it decreases in the different filaments, from the axis or most rapid filament to the border; and the connexion of this with the mean velocity, which is expressed by our formula. 3d, Having acquired some distinct notions of this, we shall be able to see the manner in which undisturbed nature works in forming the beds of our rivers, the forms which she affects, and which we must imitate in all their local modifications, if we would secure that permanency which is the evident aim of all her operations. We shall here learn the mutual action of the current and its bed, and the circumstances which ensure the stability of both. These we may call the *regimen* or the *conservation* of the stream, and may say that it is in *regimen*, or in *conservation*. There is a relation, not to the dimensions and the slope alone, or to the accelerating force and the resistance arising from mere inertia; it respects immediately the tenacity of the bed, and is different from the *train*.

66  
Regimen  
of streams  
what.

4th, These pieces of information will explain the deviation of rivers from the rectilinear course, the resistance occasioned by these deviations, and the circumstances on which the regimen of a winding stream depends.

### § 3. Of the Forms of the Channel.

The numerator of the fraction which expresses the velocity of a river in train has  $\sqrt{2}$  for one of its factors. That form, therefore, is most favourable to the motion which gives the greatest value to what we have called the hydraulic mean depth  $d$ . This is the prerogative of the semicircle, and here  $d$  is equal to half the radius; and all other figures of the same area are the more favourable, as they approach nearer to a semicircle. This is the form, therefore, of all conduit pipes, and should be taken for aqueducts which are built of masonry. Ease and accuracy of execution, however, have made engineers prefer a rectangular form; but neither of these will do for a channel formed out of the ground. We shall soon see that the semicircle is incompatible with a regimen; and, if we proceed through the regular polygons, we shall find that the half hexagon is the only one which has any pretensions to a regimen; yet experience shows us, that even its banks are too steep for almost any soil. A dry earthen bank, not bound together by grass roots, will hardly stand with a slope of 45 degrees; and a canal which conveys running waters will not stand with this slope. Banks whose base is to their height as 4 to 3 will stand very well in moist soils, and this is a slope very usually given. This form is even affected in the spontaneous operations of nature, in the channels which the digs for the rills and rivulets in the higher and steeper grounds.

men.

69  
Banks that  
stand best.

This form has some mathematical and mechanical properties which entitle it to some further notice. Let ABEC (fig. 11.) be such a trapezium, and AHGC the rectangle of equal width and depth. Bisect HB and EG by the verticals FD and KI, and draw the verticals b B, c E. Because AH : HB = 3 : 4, we have AB = 5, and BD = 2, and FI = 3, and BD + DF = BA. From these premises it follows, that the trapezium ABEC has the same area with the rectangle; for HB being bisected in D, the triangles ACF, BCD are equal. Also the border ABEC, which is touched by the passing stream, is equal to FDIK. Therefore the mean depth, which is the quotient of the area divided by the border, is the same as  $d$  and the

calc, whatever is the width BE at the bottom, or even though there be no rectangle such as b BE c interposed between the slant sides.

**Theory.**

Of all rectangles, that whose breadth is twice the height, or which is half of a square, gives the greatest mean depth. If, therefore, FK be double of FD, the trapezium ABEC, which has the same area, will have the largest mean depth of any such trapezium, and will be the best form of a channel for conveying running water. In this case, we have AC = 10, AH = 5, and BE = 10. Or we may say that the best form is a trapezium, whose bottom width is  $\frac{2}{3}$  of the depth, and whose extreme width is  $\frac{4}{3}$ . This form approaches very near to that which the torrents in the hills naturally dig for themselves in uniform ground, where their action is not checked by stones which they lay bare, or which they deposit in their course. This shows us, and it will be fully confirmed by and by, that the channel of a river is not a fortuitous thing, but has a relation to the consistency of the soil and velocity of the stream.

70  
Best form  
of a chan-  
nel.

A rectangle, whose breadth is  $\frac{2}{3}$  of the depth of water, will therefore have the same mean depth with a triangle whose surface width is  $\frac{2}{3}$  of its vertical depth; for this is the dimensions when the rectangle b BE c is taken away.

Let A be the area of the section of any channel,  $w$  its width (when rectangular), and  $b$  its depth of water. Then what we have called its mean depth, or  $d$ , will be

$$\frac{A}{w + 2b} = \frac{wb}{w + 2b}$$
 Or if  $q$  expresses the ratio of the width to the depth of a rectangular bed; that is, if  $q = \frac{w}{b}$ , we have a very simple and ready expression for the mean depth, either from the width or depth. For

$$d = \frac{w}{q + 2}, \text{ or } d = \frac{q b}{q + 2}$$

Therefore, if the depth were infinite, and the width finite, we should have  $d = \frac{w}{2}$ ; or if the width be infinite,

and the depth finite, we have  $d = b$ . And these are the limits of the values of  $d$ ; and therefore, in rivers whose width is always great in comparison of the depth, we may without much error take their real depth for their hydraulic mean depth. Hence we derive a rule of easy recollection, and which will at all times give us a very near estimate of the velocity and hence of the expanse of a running stream, viz. that the velocities are nearly as the square roots of the depths. We find this confirmed by many experiments of Michelotti.

71  
Estimate  
of the c  
times give us a very near estimate of the velocity and hence of the expanse of a running stream, viz. that the velocities are nearly as the square roots of the depths. We find this confirmed by many experiments of Michelotti.

Also, when we are allowed to suppose this ratio of the velocities and depths, that is, in a rectangular canal of great breadth and small depth, we shall have the quantities discharged nearly in the proportion of the cubes of the velocities. For the quantity discharged  $d$  is as the velocity and area jointly, that is, as the height and velocity jointly, because when the width is the same the area is as the height. Therefore, we have  $d \propto b v$ . But, by the above remark,  $b \propto v^2$ . Therefore,  $d \propto v^3$ ; and this is confirmed by the experiments of Bossut, Vol. II. 236. Also, because  $d$  is as  $v b$ , when  $w$  is constant, and by the above remark (allowable when  $w$  is very great in proportion to  $b$ )  $d$  is as  $\sqrt{b}$ , we have  $b \propto v^2$ , or  $d \propto v^2$ , the squares of the discharges proportional

Theory.

proportional to the cubes of the heights in rectangular beds, and in their corresponding trapeziums.

72  
Rules for  
finding the  
dimensions.

1. Knowing the mean depth and the proportion of the width and real depth, we can determine the dimensions of the bed; and we have  $w = qd + 2d$ , and  $b = d + \frac{2d}{q}$ .

2. If we know the area and mean depth, we can in like manner find the dimensions; that is,  $w$  and  $b$ ; for  $A = wb$ , and  $d = \frac{wb}{w + 2b}$ ; therefore  $w = \frac{A}{d + \frac{2d}{q}}$ .

3. If  $d$  be known, and one of the dimensions be given, we can find the other; for  $d = \frac{wb}{w + 2b}$  gives

$$w = \frac{2bd}{b-d}, \text{ and } b = \frac{wd}{w-2d}$$

73  
Mean  
depth,

4. If the velocity  $V$  and the slope  $S$  for a river in train be given, we can find the mean depth; for  $V = \left( \frac{297}{\sqrt{S - LV S + 1,6}} - 0,3 \right) (\sqrt{d} - 0,1)$ . Whence we deduce  $\sqrt{d} - 0,1 = \frac{V}{\frac{297}{\sqrt{S - LV S + 1,6}} - 0,3}$ , and

$$\sqrt{d} = \text{to this quantity} + 0,1.$$

74  
and slope.

5. We can deduce the slope which will put in train a river whose channel has given dimensions. We make  $\frac{297(\sqrt{d} - 0,1)}{V + 0,3(\sqrt{d} - 0,1)} = \sqrt{S}$ . This should be  $= \sqrt{S - LV S + 1,6}$ , which we correct by trials, which will be exemplified when we apply these doctrines to practice.

Having thus established the relation between the different circumstances of the form of the channel to our general formula, we proceed to consider,

## § 2. The gradations of velocity from the middle of the stream to the sides.

The knowledge of this is necessary for understanding the regimen of a river; for it is the velocity of the filaments in contact with the bed which produces any change in it, and occasions any preference of one to another, in respect of regimen or stability. Did these circumstances not operate, the water, true to the laws of hydraulics, and confined within the bounds which have been assigned them, would neither enlarge nor diminish the area of the channel. But this is all that we can promise of waters perfectly clear, running in pipes or hewn channels. But rivers, brooks, and smaller streams, carry along waters loaded with mud or sand, which they deposite wherever their velocity is checked; and they tear up, on the other hand, the materials of the channel wherever their velocity is sufficiently great. Nature, indeed, aims continually at an equilibrium, and works without ceasing to perpetuate her own performances, by establishing an equality of action and reaction, and proportioning the forms and direction of the motions to her agents, and to local circumstances. Her work is slow but unceasing; and what she cannot ac-

complish in a year she will do in a century. The beds of our rivers have acquired some stability, because they are the labour of ages; and it is to time that we owe those deep and wide valleys which receive and confine our rivers in channels, which are now consolidated, and with slopes which have been gradually moderated, so that they no longer either ravage our habitations or confound our boundaries. Art may imitate nature, and by directing her operations (which she still carries on according to her own imprescriptible laws) according to our views, we can hasten her progress, and accomplish our purpose, during the short period of human life. But we can do this only by studying the unalterable laws of mechanism. These are presented to us by spontaneous nature. Frequently we remain ignorant of their foundations, but it is not necessary for the propriety of the subject that we have the talents of the senator; he can profit by the statue without understanding its grounds. It is so in the present instance. We have not as yet been able to infer the law of retardation observed in the filaments of a running stream from any sound mechanical principle. The problem, however, does not appear beyond our powers, if we assume, with Sir Isaac Newton, that the velocity of any particular filament is the arithmetical mean between those of the filaments immediately adjoining. We may be assured, that the filament in the axis of an inclined cylindrical tube, of which the current is in train, moves the fastest, and that all those in the same circumference round it are moving with one velocity, and that the slower are those which glide along the pipe. We may affirm the same thing of the motions in a semi-cylindrical inclined channel conveying an open stream. But even in these we have not yet demonstrated the ratio between the extreme velocities, nor in the different circles. This must be divided experimentally.

And here we are under great obligations to M. de Buat. He has compared the velocity in the axis of a prodigious number and variety of streams, differing in size, form, slope, and velocity, and has computed in them all the mean velocity, by measuring the quantities of water discharged in a given time. His method of measuring the bottom velocity was simple and just. He threw in a gooseberry, as nearly as possible, of the same specific gravity with the water. It was carried along the bottom almost without touching it. See *REMARKS OF Fluids*, N° 67.

He discovered the following laws: 1. In small velocities the velocity in the axis is to that of the bottom in a ratio of considerable inequality. 2. This ratio diminishes as the velocity increases, and in very great velocities approaches to the ratio of equality. 3. What stream was most remarkable was, that neither the magnitude of the channel, nor its slope, had any influence in changing this proportion, while the mean velocity remained the same. Nay, though the stream ran on a channel covered with pebbles or coarse sand, no difference worth minding was to be observed from the velocity over a polished channel. 4. And if the velocity in the axis is constant, the velocity at the bottom is also constant, and is not affected by the depth of water or magnitude of the stream. In some experiments the depth was thrice the width, and in others the width was thrice the depth. This changed the proportion of the magnitude of the section

the velocities of different portions of the stream

Theory. section to the magnitude of the rubbing part, but made no change on the ratio of the velocities. This is a thing which no theory could point out.

77  
Mean velocity.

Another most important fact was also the result of his observation, viz. that the mean velocity in any pipe or open stream is the arithmetical mean between the velocity in the axis and the velocity at the sides of a pipe or bottom of an open stream. We have already observed, that the ratio of the velocity in the axis to the velocity at the bottom diminished as the mean velocity increased. This variation he was enabled to express in a very simple manner, so as to be easily remembered, and to enable us to tell any one of them by observing another.

If we take unity from the square root of the superficial velocity, expressed in inches, the square of the remainder is the velocity at the bottom; and the mean velocity is the half sum of these two. Thus, if the velocity in the middle of the stream be 5 inches per second, the square root is five; from which if we take unity, there remains four. The square of this, or 16, is the velocity at the bottom, and 10 is the mean velocity.

This is a very curious and important piece of information. The velocity in the middle of the stream is the exact measure of all, by any body that body floating down it; and the mean velocity is the one which regulates the train, the discharge, the effect on machines, and all the most important consequences.

78  
Expressed by a formula.

We may express this by a formula of most easy recollection. Let  $V$  be the mean velocity,  $v$  the velocity in the axis, and  $u$  the velocity at the bottom; we

have  $v = \sqrt{V - \frac{1}{2}}$  and  $u = \sqrt{V + \frac{1}{2}}$ .

Also  $v = (\sqrt{V - \frac{1}{2}} + \frac{1}{2})^2$ , and  $u = (\sqrt{V + \frac{1}{2}})^2$ .  
 $V = (\sqrt{v - \frac{1}{2}})^2 + \frac{1}{2}$ , and  $V = (\sqrt{u + \frac{1}{2}})^2 + \frac{1}{2}$ .

$$v = (\sqrt{V - \frac{1}{2}})^2 \text{ and } u = (\sqrt{V + \frac{1}{2}})^2.$$

Theory.

Also  $v - u = 2\sqrt{V - \frac{1}{2}}$  and  $v - V = V - u = \sqrt{V - \frac{1}{2}}$ : that is, the difference between these velocities increases in the ratio of the square roots of the mean velocities diminished by a small constant quantity.

This may perhaps give the mathematicians some help in ascertaining the law of degradation from the axis to the sides. Thus, in a cylindrical pipe, we may conceive the current as consisting of an infinite number of cylindrical shells sliding within each other like the draw tubes of a gun. Each of these is in equilibrio, or as nearly so, as the one within it as it is resisted by the one without; therefore as the momentum of each diminishes in the proportion of its diameter (the resistance being supposed the same in all), the velocity of separation must increase by a certain law from the sides to the axis. The magnitude of the small constant quantity here spoken of seems to fix this law.

The place of the mean velocity could not be discovered with any precision. In moderate velocities it was not more than one-fourth or one-fifth of the depth distant from the bottom. In very great velocities it was sensibly higher, but never in the middle of the depth.

The knowledge of these three velocities is of great importance. The superficial velocity is easily observed; hence the mean velocity is easily computed. This multiplied by the section gives the expence; and if we also measure the expanded border, and then obtain the mean depth (or  $\sqrt{d}$ ), we can, by the formula of uniform motion, deduce the slope; or, knowing the slope, we can deduce any of the other circumstances.

The following table of these three velocities will save the trouble of calculation in one of the most frequent questions of hydraulics.

Velocity.

The knowledge of the velocity at the bottom is of the greatest use for enabling us to judge of the action of the stream on its bed; and we shall now make some observations on this particular.

81  
Operation  
of the  
stream on  
its bed,

Every kind of soil has a certain velocity consistent with the stability of the channel. A greater velocity would enable the waters to tear it up, and a smaller velocity would permit the deposition of more moveable materials from above. It is not enough, then, for the stability of a river, that the accelerating forces are so adjusted to the size and figure of its channel that the current may be in train: it must also be in equilibrium with the tenacity of the channel.

We learn from observation, that a velocity of three inches per second at the bottom will just begin to work upon fine clay fit for pottery, and however firm and compact it may be, it will tear it up. Yet no beds are more stable than clay when the velocities do not exceed this: for the water soon takes away the impalpable particles of the superficial clay, leaving the particles of sand (licking by their lower half in the rest of the clay, which they now protect, making a very permanent bottom, if the stream does not bring down gravel or coarse sand, which will rub off this very thin crust, and allow

another layer to be worn off; a velocity of six inches will lift fine sand; eight inches will lift sand as coarse as lifted; 12 inches will sweep along fine gravel; 24 inches will roll along rounded pebbles an inch diameter; and it requires three feet per second at the bottom to sweep along smooth angular stones of the size of an egg.

82  
The manner in which a river carries on how careful of these operations is curious, and deserves to be tried on. noticed a little. We must recollect the narrow ridges or wrinkles which are left on the sand by a temporary freshet of stream. They are observed to lie across the stream, and each ridge consists of a steep face AD, BF (fig. H.) which looks down the stream, and a gentler slope DE, FC, which connects this with the next ridge. As the stream comes over the first steep AD, it is directed almost perpendicularly against the point E immediately below D, and thus it gets hold of a particle of coarse sand, which it could not have detached from the rest had it been moving parallel to the surface of it. It easily rolls it up the gentle slope EB; arrived there, the particle tumbles over the ridge, and lies close at the bottom of it at F, where it is protected by the little eddy, which is formed in the very angle; other particles

Theory.

countries. But, fortunately, those passing waters occupy less room as they advance, and by their wise employment of the most simple means, not only are the superfluous waters drained off from our fertile fields, but the drains themselves become an useful part of the country by their irrigation. They become the habitation of a prodigious number of fishes, which leave the Creator's bounty, and they become the means of mutual communication of all the benefits of cultivated society. The vague ramblings of the rivers wander over the face of the country, and bring them to every season; it is not even an indifferent circumstance, that their great strength to cut out deep beds for themselves, by the means they cut open many springs. The showers which produce of a heavy shower would never dry up, and would not dry up in many days. And it is observed that the same heat which is necessary for the vigorous growth of useful plants will produce a very copious evaporation. This must return a quantity much too copious for immediate vegetation, and the overplus would be destructive. Is it not pleasant to contemplate this adjustment of the great operations of nature, so different from each other, that if chance alone directed the detail, it was almost an infinite odds that the earth would be uninhabitable?

84

Their effect on the countries through which they pass.

But let us follow the waters in their operations, and note the face of the countries through which they flow: attending to the breadth, the depth, and the slope of the valleys, we shall be convinced that their present situation is extremely different from what it was in ancient days; and that the valleys themselves are the works of the rivers, or at least of waters which have descended from the heights, loaded with all the lighter matters which they were able to bring away with them. The rivers flow now in beds which have a considerable permanency; but this has been the work of ages. This has given stability, both by filling up and smoothing the valleys, and thus lessening the changing causes, and also by hardening the beds themselves, which are now covered with aquatic plants, and lined with the stones, gravel, and coarser sand, out of which all the lighter matters have been washed away.

The surface of the high grounds is undergoing a continual change; and the ground on which we now walk is by no means the same which was trodden by our remote ancestors. The showers from heaven carry down into the valleys, or sweep along by the torrents, a part of the soil which covers the heights and keeps. The torrents carry this soil into the brooks, and these deliver part of it into the great rivers, and these discharge into the sea this fertilizing fat of the earth, where it is swallowed up, and for ever lost to the purposes of vegetation. Thus the hillocks lose of their height, the valleys are filled up, and the mountains are left bare, and show their naked precipices, which formerly were covered over with a flesh and skin, but now look like the skeleton of this globe. The low countries raised and nourished for some time by the substance of the high lands, will go in their turn to be buried in the ocean; and then the earth, reduced to a dreary flat, will become an immense uninhabitable mass. This catastrophe is far distant, because this globe is in its youth, but it is not the less certain: and the united labours of the human race could not long protract the term.

But, in the mean time, we can trace a beneficent

purpose, and a nice adjustment of seemingly remote circumstances. The grounds near the sources of all our rivers are indeed gradually stripped of their most fertile ingredients. But had they retained them for ages, the sentient inhabitants of the earth, or at least the nobler animals, with man at their head, would not have derived much advantage from it. The general laws of nature produce changes in our atmosphere which must ever render these great elevations unfruitful. That general warmth, which is equally necessary for the useful plants as for the animal which lives on it, is confined to the lower grounds. The earth, which on the top of highest mountains could only bring forth moss and dittany, is brought into the gardens of Spalatro, produces the most luxuriant, that Dioctesian told his colleague that he had more pleasure in their cultivation than the Roman empire could confer. Thus nature not only provides us with food, but conveys it to our hands, and we have it at our doors for us till it shall be consumed. The spots of country which are but near to the sources of rivers, such as great parts of America, and the high mountainous regions of Terra Australis, are still almost uninhabited by man, and lakes, or caverns, or other means, which are not yet discovered, are long to be the means of conveying the produce of the mountains to the plains, and the mountains to the plains. The Author of Nature was not ignorant of the high ridges of the mountains, to mark the heights and the valleys, to mark out the courses of the great rivers, and give the first trace to every rivulet, but he left to man the task of draining his own habitation and the lands which are to support him, because this is a task not beyond his powers. It was therefore of immense advantage to him that those parts of the globe into which he has not yet penetrated should remain covered with lakes, marshes, and forests, which keep in the humidity of the earth, which the influence of the air, and the purifying warmth of the sun would have expended long ere now in sterile vegetation, and which the rains of heaven would have swept into the sea, had they not been thus protected by their situation, or their cover. It is therefore the business of man to open up these mines of hoarded wealth, and to thank the Author of all good, who has thus husbanded them for his use, and left them as a rightful heritage for those of his days.

The earth had not in the remote ages, as in our day, those great causes which were ready to drain off the soil, and of which only part is absorbed by the earth's surface, and the pure waters of the springs from the foot of the hills. The rivers did not then exist, or were only torrents, whose waters, confined by the gullies and glens, are searching for a place of escape. Hence arise those numerous lakes in the interior of great continents, of which there are still remarkable relics in North America, which in process of time will disappear, and become champaign countries. The most remote from the sea, unable to contain its waters, finds an issue through some gorge of the hills, and pours over its superfluous waters into a lower basin, which, in its turn, discharges its contents into another, and the last of the chain delivers its waters by a river into the ocean. The communication was originally begun by a simple overflowing at the lowest part of the margin. This made a torrent which quickly

permanency in an uniform soil necessarily supposes. Reasoning after the same manner for all the portions  $r, d, b, c, a, e, f$ , we see that the regimen will be successively established in them, and that the slope necessary for this purpose will be greater as we approach the river head. The various sections or profiles of the channel of the river  $a, b, c, d, e, f$  will therefore resemble the line **SAB CDEF**, which is figured below, having its different parts variously inclined to the horizontal line **HF**.

88

This process of nature

Such is the process of nature in perfecting a river on the surface of the globe. It is long, however, a kind of puzzle to the theorists, and a real source of vexation of the increasing, or at least the permanent velocity with smaller slope, as they find that the addition of their tributary streams, and the necessity of deep waters. We have now seen that the energy consists. It is only a greater quantity of motion remaining in the middle of a great space, after a quantity has been retarded by the bottom; and we see clearly, that since the addition of a new and perhaps an equal stream does not occupy a bed of double surface, the proportion of the retardation, to the remaining motion must continually diminish as a river increases by the addition of new streams. If therefore the slope were not diminished, the regimen would be destroyed, and the river would dig up its channel. We have a full confirmation of this in the many works which have been executed on the Po, which runs with rapidity through a rich and yielding soil. About the year 1600, the waters of the Panaro, a very considerable river, were added to the Po Grande; and although it brings along with it in its freshets a vast quantity of sand and mud, it has greatly deepened the whole Tronco di Venezia from the confluence to the sea. This point was clearly ascertained by Manfredi about the 1720, when the inhabitants of the valleys adjacent were alarmed by the project of bringing in the waters of the Rheno, which then ran through the Ferrarese. Their fears were overcome, and the Po Grande continues to deepen its channel every day with a prodigious advantage to the navigations; and there are several extensive marshes which now drain off by it, after having been for ages under water: and it is to be particularly remarked, that the Rheno is the foulest river in its freshes of any in that country. We insert this remark, because it may be of great practical utility, as pointing out a method of preserving and even improving the depth of rivers or drains in flat countries, which is not obvious, and rather appears improper: but it is strictly conformable to a true theory, and to the operations of nature, which never fails to adjust every thing so as to bring about an equilibrium. Whatever the declivity of the country may have been originally, the regimen begins to be settled at the mouth of the rivers; and the slopes are diminished in succession as we recede from the coast. The original slopes inland may have been much greater; but they will (when busy nature has completed her work) be left somewhat, and only so much greater, that the velocity may be the same notwithstanding the diminution of the section and mean depth.

Freshes will disturb this methodical progress relative only to the successive permanent additions; but their effects chiefly accelerate the deepening of the bed, and

the diminution of the slope, by augmenting the velocity during their continuance. But when the regimen of the permanent additions is once established, the freshes tend chiefly to widen the bed, without greatly deepening it, for the aquatic plants, which have been growing and thriving during the peaceable state of the river, are now laid along, but not swept away, by the freshes and protect the bottom from their attacks; and the stones and gravel, which must have been left bare in a course of years, working on the soil, will also collect in the bottom, and greatly augment its power of resistance; and even if the floods should have deepened the bottom, the small matter, some mud will be deposited, the velocity of the freshes diminishes, and this will counteract the first effect.

When we regard the soil uniform through the whole course of the bottom, supposing therefore the circumstances which govern permanency, at the regimen of a river, may be more different in the different parts, and in different seasons. We may say in general, that the higher that the regimen has advanced up the stream is at present, the lower it will be, and the more its waters to the sea.

There are some general circumstances in the motion of rivers which it will be proper to take notice of just now, that they may be afterwards more minutely examined, as they are connected with their explanations will be a series of principles, as well as of the proportions which we find necessary to demonstrate.

In a valley of small width the river always occupies the lowest part of it, and it is observed, that this is seldom in the middle of the valley, and is much to that side on which the slope from the higher grounds is steepest, and this without regard to the line of its course. The hills, river generally adheres to the steepest hills, whether they advance into the plain or retire from it. This general feature may be observed over the whole globe. It is divided into compartments by great ranges of mountains; and it may be observed, that the great rivers hold their course not very far from them, and that their chief feeders come from the other side. In every compartment there is a swell of the low country at a distance from the bounding ridge of mountains and on the summit of this swell the principal feeders of the great river have their sources.

The name *wady* is given with less propriety to these immense regions, and is more applicable to tracks of champaign land which the eye can take in at one view. Even here we may observe a resemblance. It is not always in the very lowest part of this valley that the river has its bed: although the waters of the river flow in a channel below its immediate banks, these banks are frequently higher than the grounds at the foot of the hills. This is very distinctly seen in Lower Egypt, by means of the canals which are carried backward from the Nile for accelerating its fertilizing inundations. When the canals are opened to admit the waters, it is always observed that the districts most remote are the first covered, and it is several days before the immediately adjoining fields partake of the blessing. This is a consequence of that general operation of nature by which the valleys are formed. The river in its floods is loaded with mud, which it retains as long as it rolls rapidly along its limited bed, tumbling its waters over and over, and taking up in every spot as much as it

91  
In narrow valleys rivers adhere to the steepest

**Theory.** it deposits; but as soon as it overflows its banks, the very enlargement of its section diminishes the velocity of the water; and it may be observed still running in the track of its bed with great velocity, while the waters on each side are stagnant at a very small distance. Therefore the water, on getting over the banks, must deposit the heaviest, the firmest, and even the greatest part of its burden, and must become gradually clearer as it approaches the hills. Thus a gentle slope is given the valley in a direction which is the reverse of what one would expect. It is, however, almost always the case in wide valleys, especially if the ground is covered through a soft country. The banks of the great rivers and ditches are observed to be deeper at the head than at the mouth, and the merely superficial deposit is carried off from it.

92  
The bed  
of rivers  
enlarged  
near the  
sea,

93  
The water  
being  
backed by  
the tides  
of the  
ocean,

We have already observed that the enlargement of the bed of a river, in its progress to the sea, is in proportion to the increase of its width. This would be the case even if the velocity continued the same; and therefore, since the velocity is diminished in consequence of the greater energy of the water at the mouth, which we now understand distinctly, a still further bed is furnished for conveying the water to the sea.

This general law is broken, however, in the low-lying neighbourhood of the sea: because in this situation the velocity of the water is checked by the passing flood-tides of the ocean. As the whole water must still be discharged, they require a larger bed; and the enlargement will be chiefly in width. The sand and mud are deposited when the motion is retarded. The depth of the mouth of the channel is therefore diminished. It must therefore become wider. If this be done on a coast exposed to the force of a regular tide, which carries the waters of the ocean across the mouth of the river, the regular enlargement of the mouth will be the only consequence, and it will generally widen till it reaches the foot of the adjoining hills; but if there be no tide in the sea, or a tide which does not set across the mouth of the river, the sands must be deposited at the sides of the opening, and become additions to the shore, lengthening the mouth of the channel. In this sheltered situation, every trivial circumstance will cause the river to work more on particular parts of the bottom, and deepen the channel there. This keeps the mud suspended in such parts of the channel, and it is not deposited till the stream has shot farther out into the sea. It is deposited on the sides of those deeper parts of the channel, and increases the velocity in them, and thus still further promotes the deposition. Rivers so situated will not only lengthen their channels, but will widen them, and produce islands at their mouths. A bush, a tree torn up by the roots by a mountain torrent, and floated down the stream, will thus inevitably produce an island; and rivers in which this is common will be continually shifting their mouths. The Mississippi is a most remarkable instance of this. It has a long course through a rich soil, and disembogues itself into the bay of Mexico, in a place where there is no passing tide, as may be seen by comparing the hours of high water in different places. No river that we know carries down its stream such numbers of rooted-up trees: they frequently interrupt the navigation, and render it always dangerous in the night.

**Theory.** This river is loaded with flats and shifting sands at its mouth, that the most experienced pilots are puzzled; and it has been observed its channel above 50 miles in the last period that we have known it. The discharge of the Rhodanus is very singular: so is that of the Nile; for it is discharged into a full corner of the Mediterranean. It may seem to have acquired such a corner, owing to the nature of this is owing to the nature of the coast, and as far as possible of its natural course. The Ganges too is in a situation where it is obliged to follow a similar phenomena. The Nile is an exception; but it has flowed very far in a straight line, and is pretty clear to Paris; and it is not a strong transverse tide, or rather a strong transverse tide, setting to the south-east both at high and low water. The mouth of the Po is perhaps the most remarkable of any on the surface of this globe, and its appearances extremely singular. Its situation in a sequestered corner of the Adriatic. There may be a more remarkable tide in this gulf than in any part of the Mediterranean, it is still but trifling; and it either sets directly in upon the mouth of the river, or retires straight away from it. The river has many mouths, and they shift prodigiously. There has been a general increase of the land very remarkable. The marshes where Venice now stands were, in the Augustan age, everywhere penetrable by the fishing boats, and in the 5th century could only bear a few miserable huts; now they are covered with crowds of stately buildings. Ravenna, situated on the southernmost mouth of the Po, was, in the Augustan age, at the extremity of a swamp, and the road to it was along the top of an artificial mound, made by Augustus at immense expence. It was, however, a fine city, containing extensive docks, arsenals, and other massy buildings, being the great military port of the empire, where Augustus laid up his great ships of war. In the Gothic times it became almost the capital of the Western empire, and was the seat of the government and of luxury. It must, therefore, be supposed to have every accommodation of opulence, and we cannot doubt of its having paved streets, wharfs, &c.: so that its wealthy inhabitants were at last walking dryfooted from house to house. But now it is an Italian mile from the sea, and surrounded with vineyards and cultivated fields, and is accessible in every direction. All this must have been formed by depositions from the Po, flowing through Lombardy loaded with the spoils of the Alps, which were here arrested by the reeds and bulrushes of the marsh. These things are in common course; but when wells are dug, we come to the pavements of the ancient city, and these pavements are all on one exact level, and they are eight feet below the surface of the sea at low water. This cannot be ascribed to the subsiding of the ancient city. This would be irregular, and greatest among the heavy buildings. The tomb of Theodoric remains, and the pavement round it is on a level with all the others. The lower story is always full of water; so is the lower story of the cathedral to the depth of three feet. The ornaments of both these buildings leave no room to doubt that they were formerly dry; and such a building as the cathedral could not sink without crumbling into pieces.

It is by no means easy to account for all this. The depositions

Theory.

depositions of the sea and other rivers must raise the ground; and yet the rivers must still flow over all. We must conclude that the surface of the Adriatic is by no means level, and that it slopes like water from the Lagoons of Venice to the eastward. In all probability it even slopes considerably towards the north. This will not hinder the circulation of the sea and the rivers, as will be shown in its proper place. The other shores of this gulf exhibit small undulations only.

94  
Rivers  
are convex  
athwart  
the stream,  
and the  
cause of it.

The last general observation which we have to make in this place is, that the surface of a river is not to be considered athwart the stream, but across the stream to its motion. Suppose a canal of the same extent of its surface would be a perfect level. The pressure is possible by any means to give the middle water motion in the direction of its length, they must drag along with them the waters immediately contiguous. These will move less swiftly, and will in like manner drag the waters without them; and thus the water at the sides being abstracted, the depth must be less, and the general surface must be convex across. The fact of a running stream is similar to this; the side waters are withheld by the sides, and every filament is moving more slowly than the one next it towards the middle of the river, but faster than the adjoining filament on the land side. This alone must produce a convexity of surface. But besides this, it is demonstrable that the pressure of a running stream is diminished by its motion, and the diminution is proportional to the height which would produce the velocity with which it is gliding past the adjoining filament. This convexity must in all cases be very small. Few rivers have the velocity nearly equal to eight feet *per* second, and this requires a height of one foot only. An author quoted by M. Buffon says, that he has observed on the river Aveiron an elevation of three feet in the middle during floods; but we suspect some error in the observation.

#### § 4. Of the Windings of Rivers.

95  
Winding  
course of  
rivers, how  
formed.

Rivers are seldom straight in their course. Formed by the hand of nature, they are accommodated to every change of circumstance. They wind around what they cannot get over, and work their way to either side according as the resistance of the opposite bank makes a straight course more difficult, and this seemingly fortuitous rambling distributes them more uniformly over the surface of a country, and makes them everywhere more at hand, to receive the numerous rills and rivulets which collect the waters of our springs and the superfluities of our flowers, and to comfort our habitations with the many advantages which cultivation and society can derive from their presence. In their feeble beginning, the smallest inequality of slope or consistency is enough to turn them aside and make them ramble through every field, giving drink to our herds and fertility to our soil. The more we follow nature into the minutiae of her operations, the more must we admire the innumerable fertility of her resources, and the simplicity of the means by which she produces the most important and beneficial effects. By thus twisting the course of our rivers into a crooked shape, she keeps them long amidst our fields, and thus compensates for the declivity of the surface, which otherwise would tumble them with great rapidity into the ocean, loaded with the best and richest of our soil. Without this, the

Theory.

showers of heaven would have little influence in supplying the waste of incessant evaporation. But as things are, the rains are kept slowly trickling along the sloping sides of our hills and steeps, winding round every clod, nay every plant, which lengthens their course, diminishes their slope, checks their speed, and thus prevents them from quickly brushing off from every part of the surface the lightest and best of the soil. The descent of our holm lands would be too steep, and the waters would shoot along through our finest meadows, carrying every thing away with them, and would be unfit for the purposes of inland conveyance, if the inequalities of soil did not make them change this headlong course for the lovely beautiful meanders which we observe in the banks of the small rivers winding through our country. These rivers are in general the straightest in their course, which are the most rapid, and which run along the greatest bodies of water, such are the Rhone, the Po, the Danube. The small rivers continue more direct in their progress, till they approach the sea, and have gathered strength from all their tributary streams.

96  
Every thing aims at an equilibrium, and this directs what nature has left for man to perform  
even the ramblings of rivers. It is of importance to understand the relation between the force of a river and the resistance which the soil opposes to those deviations from a rectilinear course; for it may frequently happen that the general posture of nature may be inconsistent with our local purposes. Man was set down on this globe, and the task of cultivating it was given him by nature, and his chief enjoyment seems to be to struggle with the elements. He must not find things to his mind, but he must mould them to his own fancy. Yet even this seeming anomaly is one of nature's most beneficent laws; and his exertions must still be made in conformity with the general train of the operations of mechanical nature; and when we have any work to undertake relative to the course of rivers, we must be careful not to thwart their general rules, otherwise we shall be sooner or later punished for their infraction. Things will be brought back to their former state, if our operations are inconsistent with that equilibrium which is constantly aimed at, or some new state of things which is equivalent will be soon induced. If a well-regulated river has been improperly deepened in some place, to answer some particular purpose of our own, or if its breadth has been improperly augmented, we shall soon see a deposition of mud or sand choke up our fancied improvements; because, as we have enlarged the section without increasing the slope or the supply, the velocity must diminish, and floating matter must be deposited.

It is true, we frequently see permanent channels where the forms are extremely different from that which the waters would dig for themselves in an uniform soil, and which approaches a good deal to the tripeulum described formerly. We see a greater breadth frequently compensate for a want of depth; but all such deviations are a sort of constraint, or rather are indications of inequality of soil. Such irregular forms are the works of nature; and if they are permanent, the equilibrium is obtained. Commonly the bottom is harder than the sides, consisting of the coarsest of the sand and of gravel; and therefore the necessary friction can be obtained only by increasing the width. We

## Theory.

are accustomed to attend chiefly to the appearances which prognosticate mischief, and we interpret the appearances of a permanent bed in the same way, and frequently form very false judgments. When we see one bank low and flat, and the other high and abrupt, we suppose that the waters are passing along the first in peace, and with a gentle stream, but that they are rapid on the other side, and are tearing away the bank; but it is just the contrary. The bed being permanent, things are in equilibrium, and each bank is of a form just competent to that equilibrium. If the soil on both sides be uniform, the stream is most rapid on that side where the bank is low and flat, for in no other form would it withstand the action of the stream; and it has been worn away till its depth compensates for the greater force of the stream. The stream on the other side must be more gentle, otherwise the bank could not remain abrupt. In short, in a state of permanency, the velocity of the stream and form of the bank are just suited to each other. It is quite otherwise before the river has acquired its permanent regimen.

97  
Necessity of attending to nature in regulating the course of rivers.

A careful consideration therefore of the general features of rivers which have settled their regimen, is of use for informing us concerning their internal motions, and directing us to the most successful method of regulating their course.

We have already said that perpendicular brims are inconsistent with stability. A semicircular section is the form which would produce the quickest train of a river, whose expense and slope are given, but the banks at B and D (fig. 14.) would crumble in, and lie at the bottom, where their horizontal surface would focus them from farther change. The bed will acquire the form G, *c* F, of equal section, but greater width, and with brims less shelving. The proportion of the velocities at A and C may be the same with that of the velocities at G and F, but the velocity at G and F will be less than it was formerly at B, C, or D; and the velocity in any intermediate point E, being somewhat between those at F and C, must be less than it was in any intermediate point of the semicircular bed. The velocities will therefore decrease along the border from C towards G and F, and the steepness of the border will augment at the same time, till, in every point of the new border G, *c* F, these two circumstances will be so adjusted that the necessary equilibrium is established.

The same thing must happen in our trapezium. The slope of the brims may be equal, and will be retained; it will, however, be too great anywhere below, where the velocity is greater, and the sides will be worn away till the banks are undermined and crumble down, and the river will maintain its section by increasing its width. In short, no border made up of straight lines is consistent with that gradation of velocity which will take place whenever we depart from a semicircular form. And we accordingly see, that in all natural channels the section has a curvilinear border, with the slope increasing gradually from the bottom to the brim.

These observations will enable us to understand how nature operates when the inequality of surface or of tenacity obliges the current to change its direction, and the river forms an elbow.

Supposing always that the discharge continues the same, and that the mean velocity is either preserved or

restored, the following conditions are necessary for a permanent regimen.

1. The depth of water must be greater in the elbow than anywhere else.
2. The main stream, after having struck the concave bank, must be deflected in an equal angle, and must then be in the direction of the next reach of the river.
3. The angle of incidence must be proportioned to the tenacity of the soil.
4. There must be in the elbow an increase of slope, equal to that of which is capable of overcoming the resistance produced by the elbow.

The reason why, at least, of these conditions will appear from the following considerations:

It is evident, that force is expended in producing this change of direction in a channel which by supposition is straight and uniform. The diminution arising from this force which can be compared with friction must be greater when the stream is directed against one of the banks. It may be very difficult to state the properties, and it would occupy too much of our time to attempt it; but it is sufficient that we be convinced that the retardation is greater in this case. We see no cause to increase the mean velocity in the elbow, and we must therefore conclude that it is diminished. But we are supposing that the discharge continues the same; the section must therefore augment, or the channel increase its transverse dimensions. The only question is, In what manner it does this, and what change of form does it affect, and what form is competent to the final equilibrium and the consequent permanency of the bed? Here there is much room for conjecture. M. Buat reasons as follows: If we suppose that the points B and C (fig. 15) continue on a level, and that the points H and I at the beginning of the next reach are also on a level, it is an inevitable consequence that the slope along CMI must be greater than along BEH, because the depression of H below B is equal to that of I below C, and BEH is longer than CMI. Therefore the velocity along the convex bank CMI must be greater than along BEH. There may even be a stagnation and an eddy in the contrary direction along the concave bank. Therefore, if the form of the section were the same as up the stream, the sides could not stand on the convex bank. When therefore the section has attained a permanent form, and the banks are again in equilibrium with the action of the current, the convex bank must be much flatter than the concave. If the water is really still on the concave bank, that bank will be absolutely perpendicular; nay, may overhang. Accordingly, this state of things is matter of daily observation, and justifies our reasoning, and entitles us to say, that this is the nature of the internal motion of the filaments which we cannot distinctly observe. The water moves most rapidly along the convex bank, and the thread of the stream is nearest to this side. Reasoning in this way, the section, which we may suppose to have been originally of the form M b a E (fig. 16.) assumes the shape MBAE.

2. Without presuming to know the mechanism of the internal motions of fluids, we know that superficial waves are reflected precisely as if they were elastic bodies, making the angles of incidence and reflection. In as far therefore as the superficial wave is concerned in the operation, M. Buat's second pos-

98  
Conditions necessary for a permanent regimen.

99  
Reasonable-ness of these conditions.

**Theory.** the formula for uniform motion, and of the slope which is necessary for overcoming the resistance arising from its bendings along.

Thus, let there be a river which, in the expanded course of 6000 fathoms, has 10 rebounds, each of which has 30° of rebound, and let its given velocity be 20 inches in a second. If we would know its whole slope in this 6000 fathoms, we must first find, from the formula of uniform motion, the force which will produce the velocity of 20 inches in a straight line of the same length, section, and mean depth. Suppose that to be

**Theory.** 17800 or 20 inches in this whole length. We must

then find (by the formula  $\frac{V^2 \sin^2}{3200}$ ) the slope necessary

for overcoming the resistance of 10 rebounds of 30° each. This we shall find to be 6 $\frac{1}{2}$  inches in the 6000 fathoms. Therefore the river must have a slope of 26 $\frac{1}{2}$  inches in 6000 fathoms, or  $\frac{1}{225}$ ; and this slope will produce the same velocity which 20 inches, or  $\frac{1}{180}$ , would do in a straight running river of the same length.

## PART II. PRACTICAL INFERENCES.

**H**AVING thus established a theory of a most important part of hydraulics, which may be considered in as a just representation of nature's procedure, we shall apply it to the examination of the chief nature of every thing which art has contrived for limiting the operations of nature, or modifying them so as to fit our particular views. Trusting to the detail which we have given of the connecting principles, and the chief circumstances which co-operate in producing the ostensible effect; and supposing that such of our readers as are interested in this subject will not think it too much trouble to make the applications in the same detail; we shall content ourselves with merely pointing out the steps of the process, and showing their foundation in the theory itself: and frequently, in place of the direct analysis which the theory enables us to employ for the solution of the problems, we shall recommend a process of approximation by trial and correction, sufficiently accurate, and more within the reach of practical engineers. We are naturally led to consider in order the following articles:

1. The effects of permanent additions of every kind to the waters of a river, and the most effectual methods of preventing or removing inundations.
2. The effects of weirs, bars, sluices, and keeps of every kind, for raising the surface of a river; and the similar effects of bridges, piers, and every thing which contracts the section of the stream.
3. The nature of canals; how they differ from rivers in respect of origin, discharge, and regimen, and what conditions are necessary for their most perfect construction.
4. Canals for draining land, and drafts or canals of derivation from the main stream. The principles of their construction, so that they may suit their intended purposes, and the change which they produce on the main stream, both above and below the point of derivation.

*Of the effects of permanent additions to the waters of a River.*

From what has been said already, it appears that to every kind of soil or bed there corresponds a certain velocity of current, too small to hurt it by digging it up, and too great to allow the deposition of the materials which it is carrying along. Supposing this known for any particular situation, and the quantity of water which the channel must of necessity discharge, we may wish to learn the smallest slope which must be given to this stream, that the water may run with the required velocity. This suggests

**PROB. I.** Given the discharge  $D$  of a river, and  $V$  the velocity of regimen: required the smallest slope  $s$ , and the dimensions of its bed?

Since the slope must be the smallest possible, the bed must have the form which will give the greatest mean depth  $d$ , and should therefore be the trapezium formerly described, whose sides and perimeter are the same with those of a rectangle whose breadth is twice its height.

$D$  These circumstances give us the equation  $\frac{D}{V} = 2b^2$ . For the area of the section is twice the square of the height, and the discharge is the product of this area and the velocity. Therefore  $\sqrt{\frac{D}{2V}} = b$  and  $\sqrt{\frac{2D}{V}} =$  the breadth  $2b$ .

The formula of uniform motion gives  $V = L\sqrt{s} + 1,6$   $\frac{20}{\sqrt{1,6 - 0,1}}$ . Instead of  $\sqrt{1,6 - 0,1}$ , put it

equal  $\sqrt{\frac{1,6}{2} - 0,1}$ , and every thing being known in the second member of this equation, we easily get the value of  $s$  by a few trials after the following manner. Suppose that the second member is equal to any number, such as 9. First suppose that  $\sqrt{s} = 9$ . Then the hyperbolic logarithm of  $9 + 1,6$  or of 10,6 is 2,36. Therefore we have  $1,6 + L\sqrt{s} + 1,6 = 9 - 2,36 = 6,64$ ; whereas it should have been = 9. Therefore say  $6,64 : 9 :: 12,2$  nearly. Now suppose that  $\sqrt{s}$  is 12,2. Then  $L 12,2 + 1,6 = L 13,8 = 2,625$  nearly, and  $12,2 - 2,625$  is 9,575, whereas it should be 9. Now we find that changing the value of  $\sqrt{s}$  from 9 to 12,2 has changed the answer from 6,64 to 9,575, or a change of 3,2 in our assumption has made a change of 2,935 in the answer, and has left an error of 2,975. Therefore say  $2,935 : 0,575 = 5,1 : 0,628$ . Then, taking 0,628 from 12,2, we have (for our next assumption or value of  $\sqrt{s}$ ) 11,572. Now  $11,572 + 1,6 = 13,172$ , and  $L 13,172$  is 2,58 nearly. Now try this last value  $11,572 - 2,58$  is 9,008, sufficiently exact. This may serve as a specimen of the trials by which we may avoid an intricate analysis.

**PROB. II.** Given the discharge  $D$ , the slope  $s$ , and the velocity  $V$ , of permanent regimen, to find the dimensions of the bed.

Let  $x$  be the width, and  $y$  the depth of the channel; and  $S$  the area of the section. This must be  $= \frac{D}{V}$  which is therefore  $= xy$ . The denominator  $s$  being given

103  
Approximation by trial and correction recommended to practical engineers.

104  
Problems and examples on the effects of permanent additions to the waters of a river.

### Practical Inferences.

remark also formerly made on this case, that the squares of the discharges are nearly as the cubes of the height, or  $1500^3 : 4500^3 = 6^3 : 12,48^3$ .

And in making these first guesses we shall do it more exactly, by recollecting that a certain variation of the mean depth  $d$  requires a greater variation of the height, and the increment will be to the height nearly as half the height to the width, as may easily be seen. There-

fore, if we add to 12,48 its  $\frac{6.24}{150}$  part, or its 14th part,

viz. 0,52, we have 13 for our first assumption, exceeding the truth only an inch and a half. We mention these circumstances, that those who are disposed to apply their doctrines to the solution of practical cases may be at no loss when one occurs of which the regular solution requires an intricate analysis.

It is evident that the inverse of the foregoing problems will show the effects of enlarging the lower part of the river, that is, will show how much its future will be sunk by any proposed enlargement of its bed. It is therefore needless to propose such problems in this place. Common sense directs us to make these enlargements in those parts of the river where their effect will be greatest, that is, where it is shallowest when its breadth greatly exceeds its depth, or where it is narrowest (if its depth exceed the breadth, which is a very rare case), or in general, where the slope is the smallest for a short run.

The same general principles direct us in the method of embankments, for the prevention of floods, by enabling us to ascertain the heights necessary to be given to our banks. This will evidently depend, not only on the additional quantity of water which experience tells us a river brings down during its freshes, but also on the distance at which we place the banks from the natural banks of the river. This is a point where mistaken economy frequently defeats its own purpose. If we raise our embankment at some distance from the natural banks of the river, not only will a smaller height suffice, and consequently a smaller base, which will make a saving in the duplicate proportion of the height ; but our works will be so much the more durable nearly, if not exactly, in the same proportion. For by thus enlarging the additional bed which we give to the swollen river, we diminish its velocity almost in the same proportion that we enlarge its channel, and thus diminish its power of ruining our works. Except, therefore, in the case of a river whose freshes are loaded with fine sand to destroy the turf, it is always proper to place the embankment at a considerable distance from the natural banks. Placing them at half the breadth of the stream from its natural banks will nearly double its channel; and, except in the case now mentioned, the space thus detached from our fields will afford excellent pasture.

It must be remarked, in the first place, that the river will rise higher when embanked than it does while it was allowed to spread; and it is by no means easy to conclude to what height it will rise from the greatest height to which it has been observed to rise in its floods. When at liberty to expand over a wide valley; then it could only rise till it overflowed with a thickness or depth of water sufficient to produce a motion backwards into the valley quick enough to take off the water as fast as it was supplied; and we imagine that a foot or two would suffice in most cases. The best way for a prudent engineer will be to observe the utmost rise remembered by the neighbours in some gorge, where the river cannot spread out. Measure the increased section in this place, and at the same time recollect, that the water increases in a much greater proportion than the section; because an increase of the hydraulic mean depth produces an increase of velocity in the duplicate proportion of the depth nearly. But as this augmentation of velocity will obtain also between the embankments, it will be sufficiently exact to suppose that the section will be increased here nearly in the same proportion as at the gorge already mentioned. Neglecting this method of information, and regulating the height of the embankment by the greatest swell that has been observed in the plain, will assuredly make them too low, and render them totally useless.

A line of embankment should always be carried on by a strict concert of the proprietors of both banks through its whole extent. A greedy proprietor, by advancing his own embankment beyond that of his neighbour, not only exposes himself to risk by the working of the waters on the angles which this will produce, but exposes his neighbours also to danger, by narrowing the section and thereby raising the surface and increasing the velocity; and by turning the stream athwart, and causing it to shoot against the opposite bank. The whole should be as much as possible in a line, and the general effect should be to make the course of the stream straighter than it was before. All bends should be made more gentle, by keeping the embankment further from the river in all convex lines of the natural bank, and bringing it nearer where the bank is concave. This will greatly diminish the action of the waters on the bankment, and ensure their duration. The same maxim must be followed in fencing any brook which discharges itself into the river. The bends given at its mouth to the two lines of embankment should be made less acute than those of the natural brook, although, by this means, two points of land are left out. And the opportunity should be embraced of making the direction of this transverse brook more sloping than before, that is, less athwart the direction of the river.

It is of great consequence to cover the outside of the dyke with very compact turf closely united. If it admit water, the interior part of the wall, which is always more porous, becomes drenched in water, and this water acts with its statical pressure, tending to burst the bank on the land-side, and will quickly shift it from its seat. The utmost care should therefore be taken to make it and keep it perfectly tight. It should be a continued fine turf, and every bare spot should be carefully covered with fresh sod; and rat holes must be carefully closed up.

*Of straightening or changing the course of Rivers.*

107  
Of the  
slope re-  
quired at  
the bend  
of a river,  
and the  
conse-  
quences.

We have seen, that every bending of a river requires an additional slope in order to continue its train, or enable it to convey the same quantity of water without swelling in its bed. Therefore the effect of taking away any of these bends must be to sink the waters of the river. It is proper, therefore, to have it in our power to eliminate these effects. It may be desirable to gain property, by taking away the sweeps of a very winding stream. But this may be prejudicial, by destroying the navigation on such a river. It may also hurt the proprietors below, by increasing the velocity of the stream, which will expose them to the risk of its overflowing, or of its destroying its bed, and forming a new course. Or this increase of velocity may be inconsistent with the regimen of the new channel, which may require larger dimensions than the old one, and which we are ignorant of this effect.

Our principles of uniform motion enable us to answer every question of this kind, which the river M. de Buat proposes several problems to us. The regular solutions of them are not difficult, but difficult; and we do not think them necessary, because they may all be solved in a manner more so elegant, because indirect, but abundant, accurate, and easy to any person familiar with the principles we have already considered.

We can take the exact level across all these bends, and thus obtain the whole slope. We can measure with accuracy the velocity in some part of the channel, which is most remote from any bend, and where the channel itself has the greatest regularity of form. This will give us the expense or discharge of the river, and the mean depth connected with it. We can then examine whether this velocity is precisely such as is compatible with stability in the straight course. If it is, it is evident that if we cut off the bends, the greater slope which this will produce will communicate to the waters a velocity incompatible with the regimen suited to this soil, unless we enlarge the width of the stream, that is, unless we make the new channel more capacious than the old one. We must now calculate the dimensions of the channel which, with this increased slope, will conduct the waters with the velocity that is necessary. All this may be done by the foregoing problems, and we may easily accomplish this by steps. First, suppose the same with the old one, and calculate the velocity on the increased slope by the general formula, using one of the dimensions of the channel, so as to produce the velocity we want, which is a very simple process. And in doing this, the object to be kept chiefly in view is not to make the new velocity such as will be incompatible with the stability of the new bed.

Having accomplished this first purpose, we learn (in the very solution) how much shallower this channel with its greater slope will be than the former, while it discharges all the waters. This diminution of depth must increase the slope and the velocity, and must diminish the depth of the river, above the place where the alteration is to be made. How far it produces these effects may be calculated by the general formula. We then see whether the navigation will be hurt, either in the old river up the stream, or in the new channel.

It is plain that all these points cannot be reconciled. We may make the new channel such, that it shall leave a velocity compatible with stability, and that it shall not diminish the depth of the river up the stream. But, having a greater slope, it must have a smaller mean depth, and also a smaller real depth, unless we make it of a very inconvenient form.

The same thing viewed in a different light will show us what depression of waters may be produced by rectifying the channel, in order to prevent its overflowing. And the effects which we would recommend in the foregoing. We apprehend it is not necessary to measure the angles of rebound, or the angles of the slope which is employed for sending the waters round the bend, with a view to superfluous labour in straightening the river. It is infinitely easier to measure the levels themselves, and to observe the effect of removing them.

We shall follow M. de Buat in solving problems relating to the slope and velocity, and deepening the channel of a river by bending its course. The examples which would be in every case enormous; and the principles which we are just going to enter upon afford easier methods of accomplishing all the purposes which are to be gained by these changes.

*Of Bars, Weirs, and Jettyes, for raising the Surface of Rivers.*

We propose, under the article *WATER Works*, to consider in sufficient practical detail all that relates to the construction and mechanism of these and other erections in water; and we confine ourselves, in this place, to the mere effect which they will produce on the current of the river. 108  
Problems,  
examples,  
and consequences of  
raising the  
surface of  
rivers.

We gave the name of *weir* or *bar* to a dam erected across a river for the purpose of raising its waters, whether in order to take off a draft for a mill or to deepen the channel. Before we can tell the effect which they will produce, we must have a general rule for ascertaining the relation between the height of the water above the lip of the weir or bar, and the quantity of water which will flow over.

First, then, with respect to a weir, represented in fig. 18. and fig. 18. N° 2. The latter figure more resembles their usual form, consisting of a dam of solid masonry, or built of timber, properly fortified with shoars and banks. On the top is set up a strong plank FR. called the wasteboard, or waster, over which the water flows. This is brought to an accurate level, at the proper height. Such voiders are frequently made in the side of a mill-course, for letting the superfluous water run off. This is properly the *WASTER*, *VOYER*; it is also called an *offset*. The same observations will explain all these different pieces of practice. The following questions occur in course.

PROB. I. Given the length of an offset or wasteboard, made in the face of a reservoir of stagnant water, and the depth of its lip under the horizontal surface of the water, to determine the discharge, or the quantity of water which will run over in a second?

Let AB be the horizontal surface of the still water, and F the lip of the wasteboard. Call the depth BF under the surface *b*, and the length of the wasteboard *L*. N. B. The water is supposed to flow over into another basin or channel, so much lower that the surface

Practical  
Inferences.

Practical  
Inferences.

Practical  
Inferences.

HL of the water is lower, or at least not higher, than F.

If the water could be supported at the height BF, BF might be considered as an orifice in the side of a vessel. In which case, the discharge would be the same as if the whole water was flowing with the velocity acquired from the height BF, or as if we suppose, that there is no contraction at the orifice, the mean velocity would be  $\sqrt{2gBF}$ , or 15 English inches per second. The area of the orifice is  $BF \times IF$ .

Therefore the discharge would be  $\sqrt{2gBF} \times BF \times IF$ , being measured in inches. This is the least that it is not an exact representation of the manner in which the efflux really happens. The water surface would at the height BF; but in drawing towards the wasteboard from all sides, it forms a curved surface, so that the point I, where the vertical water meets the edge of the wasteboard meets the curve, is at a point lower than B. But as all the mass above I is supposed perfectly fluid, the pressure of the incumbent water is propagated, in the opinion of M. de Buat, to the filament passing over at F without any diminution. The same may be said of any filament between F and I. Each tends, therefore, to move in the same manner as if it were really impelled through an orifice in its place. Therefore the motions through every part of the line or plane IF are the same as if the water were escaping through an orifice IF, made by a sluice let down on the water, and keeping up the water of the reservoir to the level AB. It is beyond a doubt (says he) that the height IF must depend on the whole height BF, and that there must be a certain determined proportion between them. He does not attempt to determine this proportion theoretically, but says, that his experiments ascertain it with great precision to be the proportion of one to two, or that IF is always one-half of BF. He says, however, that this determination was not by an immediate and direct measurement; he concluded it from the comparison of the quantities of water discharged under different heights of the water in the reservoir.

We cannot help thinking that this reasoning is very defective in several particulars. It cannot be inferred, from the laws of hydrostatical pressure, that the filament at I is pressed forward with all the weight of the column BI. The particle I is really at the surface; and considering it as making part of the surface of a running stream, it is subjected to hardly any pressure, any more than the particles on the surface of a cup of water held in the hand, while it is carried round the axis of the earth and round the sun. Reasoning according to his own principles, and availing himself of his own discovery, he should say, that the particle at I has an accelerating force depending on its slope only; and then he should have endeavoured to ascertain this slope. The motion of the particle at I has no immediate connexion with the pressure of the column BI; and if it had, the motion would be extremely different from what it is: for this pressure alone would give it the velocity which M. Buat assigns it. Now it is already passing through the point I with the velocity which it has acquired in descending along the curve AI; and this is the real state of the case. The particles are passing through with  $x$  velocity already acquired by a sloping current: and they are accelerated

by the hydrostatical pressure of the water above them. The internal mechanism of these motions is infinitely more complex than M. Buat here supposes; and on this supposition, he very nearly abandons the theory which he has so ingeniously established, and adopts the theory of Guglielmini which he had exploded. At the same time, we think that he is not much mistaken when he asserts, that the motions are nearly the same as if a sluice had been let down from the surface to I. For the filament which passes at I has been gliding down a curved surface, and has not been exposed to any friction. It is perhaps the very case of hydraulics where the resistances are the smallest; and we should therefore expect, that its motion will be the least retarded.

We have therefore no hesitation in saying, that the filament at I is in the very state of motion which the theory would assign to it if it were passing under a sluice, or as if it were passing under a sluice. And with respect to the inferior filament, without attempting the very difficult task of determining these motions, we shall just say, that we do not see any reason for supposing that they will move differently from the superior. Therefore, though we reject his theory, we admit his experimental proposition in general; that is, we admit that the whole water which passes through the plane IF moves with the velocity (though not in the same direction) with which it would have run through a sluice of the same depth; and we may proceed with his determination of the quantity of water discharged.

If we make BC the axis of a parabola BECH, the velocity of the filament passing at I and F will be represented by the ordinates IE and FQ, and the discharge by the area IEQF. This allows a very neat solution of the problem. Let the quantity discharged per second be D, and let the whole height BF be  $b$ . Let  $x$  be the quantity by which we must divide the square of the mean velocity, in order to have the producing height. This will be less than  $\frac{1}{2}g$ , the acceleration of gravity, on account of the convergency at the sides and the tendency to convergence at the lip F. We formerly gave for its measure 7.16 inches, instead of 7.92, and said that the inches discharged per second from an orifice of one inch were 26.49, instead of 27.76. Let  $x$  be the distance of any filament from the horizontal line AB. An element of the orifice, therefore, (for we may give it this name) is  $dx$ . The velocity of this element is  $\sqrt{2Gx}$ , or  $\sqrt{2G} \times \sqrt{x}$ . The discharge from it is  $\sqrt{2G} \times \sqrt{x} \times dx$ , and the fluent of this, or  $D = \int \sqrt{2G} \times \sqrt{x} \times dx$ , which is  $\frac{2}{3} \sqrt{2G} x^{\frac{3}{2}} + C$ .

To determine the constant quantity C, observe that M. de Buat found by experiment that BI was in all cases  $\frac{1}{2}BF$ . Therefore D must be nothing when  $x = \frac{1}{2}b$ ; consequently  $C = -\frac{2}{3} \sqrt{2G} \left(\frac{b}{2}\right)^{\frac{3}{2}}$ , and the completed fluent will be  $D = \frac{2}{3} \sqrt{2G} \left(x^{\frac{3}{2}} - \left(\frac{b}{2}\right)^{\frac{3}{2}}\right)$ .

Now make  $x = b$ , and we have  $D = \frac{2}{3} \sqrt{2G} \left(b^{\frac{3}{2}} - \left(\frac{b}{2}\right)^{\frac{3}{2}}\right) = \frac{2}{3} \sqrt{2G} \left(1 - \left(\frac{1}{2}\right)^{\frac{3}{2}}\right) b^{\frac{3}{2}}$ . But  $1 - \left(\frac{1}{2}\right)^{\frac{3}{2}} = 0.64645$ , and  $\frac{2}{3}$  of this is 0.4311. Therefore, finally,

Practical  
Inferences.

$$D = 0.431 (\sqrt{2G} b^{\frac{1}{2}} \times I)$$

If we now put 26.49 or 26 $\frac{1}{2}$  for  $\sqrt{2G}$ , or the velocity with which a head of water of one inch will impel the water over a weir, and multiply this by 0.431, we get the following quantity 11.4172, or, in numbers of easy recollection, 11 $\frac{1}{2}$ , for the cubic inches of water per second, which runs over every inch of a wasteboard when the edge of it is one inch below the surface of the reservoir; and this must be multiplied by  $b^{\frac{1}{2}}$ , or by the square root of the cube of the head of water. Thus let the edge of the wasteboard be four inches below the surface of the water. The cube of this is 64, of which the square root is eight. Therefore a wasteboard of this depth under the surface, and three feet long, will discharge every second  $8 \times 11\frac{1}{2} \times 3$  cubic inches of water, or 15 $\frac{1}{2}$  cubic feet, English measure.

The following comparisons will show how far the theory may be depended on. Col. 1. Shows the height of the edge of the board under the surface of the water. Col. 2. Shows the discharge by theory; and Col. 3. The discharge actually observed. The length of the board was 3 feet in all cases. *N. B.* The number in M. Buat's calculations has been reduced to English measure.

D.	D. Theor.	D. Obs.
4.778	306	344
5.199	324	361
4.665	2153	2153
6.753	3750	3721

The last column is the cubic inches discharged in a second by each inch of the wasteboard. The correspondence is undoubtedly very great. The greatest error is in the first, which may be attributed to a small lateral contraction under its small head of water.

But it must be remarked, that the calculation proceeds on two suppositions. The height FI is supposed  $\frac{1}{2}$  of BI; and  $\sqrt{2G}$  is supposed 26. It is evident, that by increasing the one and diminishing the other, nearly the same answers may be produced; unless much greater variations of  $b$  be examined. Both of these quantities are matters of considerable uncertainty, particularly the first; and it must be farther remarked, that this was measured, but deduced from the uniformity of the experiments. We presume that M. Buat tried various values of  $G$ , till he found one which gave the ratio of discharge which he observed. We beg leave to observe, that in a set of numerous experiments which we had access to examine, BI was uniformly much less than  $\frac{1}{2}$ ; it was very nearly  $\frac{1}{3}$ ; and the quantity discharged was greater than what would result from M. Buat's calculation. It was farther observed, that IF depended very much on the form of the wasteboard. When it was a very thin board of considerable depth, IF was very considerably greater than if the board was thick, or narrow; and let on the top of a broad dam-head, as in fig. 18. N° 2.

It may be proper to give the formula a form which will correspond to any ratio which experience may discover between BF and IF. Thus, let BI be  $\frac{m}{n}$  BF.

$$\text{The formula will be } D = \frac{1}{3} \sqrt{2G} \left(1 - \left(\frac{m}{n}\right)^{\frac{1}{2}}\right) b^{\frac{1}{2}}$$

It is hoped that this and some other fundamental facts in practical hydraulics will soon be determined by accurate experiments. The honourable Board for Fish-

eries and Improvements in Scotland have allotted a sum of money for making the necessary experiments, and the results will be published by their authority. Meantime, this theory of M. de Buat is of great value to the practical engineer, who at present must content himself with a very vague conjecture, or take the calculation of the French theory of Goussier. By that theory, the board of a wasteboard, at the depth of four inches, should deliver nearly 34 cubic feet per second, which is much more than what it really delivers.

The following table will be useful to engineers, who are not familiar with such calculations. It contains, in the first column, the depth in English inches from the surface of the water to the edge of the wasteboard; the second column is the cubic feet of water discharged in a minute by every inch of the wasteboard.

Depth.	Discharge.
1	0.403
2	1.140
3	2.095
4	3.225
5	4.507
6	5.925
7	7.466
8	9.122
9	10.884
10	12.748
11	14.707
12	16.758
13	18.895
14	21.117
15	23.419
16	25.800
17	28.258
18	30.786

When the depth does not exceed four inches, it will not be exact enough to take the proportional parts for the fractions of an inch. The following method is exact.

If they be odd quarters of an inch, look in the table for as many inches as the depth contains quarters, and take the eighth part of the answer. Thus, for 3 $\frac{1}{4}$  inches, take the eighth part of 23.419, which corresponds to 15 inches. This is 2.927.

If the wasteboard is not on the face of a dam, but in a running stream, we must augment the discharge by multiplying the section by the velocity of the stream. But this correction can seldom occur in practice; because, in this case, the discharge is previously known; and it is  $b$  that we want; which is the object of the next problem.

We only beg leave to add, that the experiments which we mention as having been already made in this country, give a result somewhat greater than this table; viz. about  $\frac{1}{8}$ . Therefore, having obtained the answer by this table, add to it its 16th part, and we apprehend that it will be extremely near the truth.

When, on the other hand, we know the discharge over a wasteboard, we can tell the depth of its edge under the surface of the stagnant water of the reservoir; because we have  $b = \left(\frac{D}{11\frac{1}{2}}\right)^{\frac{2}{3}}$  very nearly.

Practical  
Inferences.

Practical Inferences.

We are now in a condition to solve the problem respecting a weir across a river.

PROB. II. The discharge and section of a river being given, it is required to determine how much the waters will be raised by a weir of the whole breadth of the river, discharging the water with a clear fall, that is, the surface of the water in the lower channel being below the edge of the weir.

In this case, we have a clear fall, and therefore there will be no contraction at the sides of the weir, as in the whole breadth of the river. But because the water is not now stagnant, but moving, the velocity  $\frac{D}{S}$ ,  $S$  being the section of the river.

Therefore let  $a$  be the height of the water above the bottom of the river, and  $b$  the height of the water above the edge of the weir. We have the velocity with which the water approaches the weir,  $\frac{D}{S}$ ,  $l$  being the length of the weir or breadth of the river. Therefore the height producing the primary velocity is  $\left(\frac{D}{l\sqrt{2g}(a+b)}\right)^2$ . The equation gives a

little ago will give  $b = \left(\frac{D}{0.431\sqrt{2g}}\right)^{\frac{2}{3}}$ , when the water above the weir is stagnant. Therefore, when it is already moving with the velocity  $\frac{D}{la+b}$ , we shall have  $b = \left(\frac{D}{0.431\sqrt{2g}}\right)^{\frac{2}{3}} - \left(\frac{D}{l\sqrt{2g}(a+b)}\right)^2$ . It would be very troublesome to solve this equation regularly, because the unknown quantity  $b$  is found in the second term of the answer. But we know that the height producing the velocity above the weir is very small in comparison of  $b$  and of  $a$ , and, if only estimated roughly, will make a very insensible change in the value of  $b$ ; and, by repeating the operation, we can correct this value, and obtain  $b$  to any degree of exactness.

To illustrate this by an example: Suppose a river, the section of whose stream is 150 feet, and that it discharges 174 cubic feet of water in a second; how much will the waters of this river be raised by a weir of the same width, and 3 feet high?

Suppose the width to be 50 feet. This will give 3 feet for the depth; and we see that the water will have a clear fall, because the lower stream will be the same as before.

The section being 150 feet, and the discharge 174, the mean velocity is  $\frac{174}{150} = 1.16$  feet,  $\approx 14$  inches nearly, which requires the height of  $\frac{1}{4}$  of an inch very nearly. This may be taken for the second term of the

value of  $b$ . Therefore  $b = \left(\frac{D}{0.431\sqrt{2g}}\right)^{\frac{2}{3}} - \frac{1}{4}$ . Now  $\sqrt{2g}$  is, in the present case,  $\approx 27.313$ ;  $l$  is 600, and  $D$  is  $174 \times 1728 = 300672$ . Therefore  $b = 12.192 - 0.25 = 11.942$ . Now correct this value of  $b$ , by correcting the second term, which is  $\frac{1}{4}$  of an inch, in-

stead of  $\left(\frac{D}{\sqrt{2gl}(a+b)}\right)^2$ , or 0.141. This will give us  $b = 12.192 - 0.141 = 12.051$ , differing from the full value about  $\frac{1}{2}$  of an inch. It is needless to carry

the approximation farther. Thus we see that a weir, which dams up the whole of the former current of three feet deep, will only raise the waters of this river one foot.

The same rule serves for showing how high we ought to raise this weir in order to produce any given rise of the waters, whether for the purposes of navigation, or for taking off a draft to drive mills, or for any other service; for if the breadth of the river remain the same, the water will still flow over the weir with nearly the same depth. A very small and hardly perceptible difference will indeed arise from the diminution of slope produced by this rise, and a consequent diminution of the velocity with which the river approaches the weir. But this difference must always be a small fraction of the total term of our answer, which term is itself very small, and this will be compensated, in some degree, by the fall which the water will have over the weir.

It is not necessary to have the whole breadth of the river, which is seldom necessary even for the purpose of navigation; the water will be raised higher by the same height of the weir. The calculation is precisely the same for this case. Only in the second term of the answer, the least inflection corresponding to the velocity of the water, must still be taken for the whole breadth of the river, which is the first term  $l$  in the length of the weir. A little less must be a little less, on account of the contractions at the ends of the weir, which must be avoided by giving the masonry at the sides of the weir a curved shape on the upper side of the weir. This should be the case when the sole object of the weir is to raise the surface of the water. It is not useful in any case, when the length of the weir is considerable, in proportion to the thickness of the river of water flowing over it.

The following comparison of this rule with experiment will give our readers some notion of its utility.

Discharge of the River per Second.	Mean velocity of the Water.	Mean velocity above the Weir.	Calculated Height of the River above the Weir.	Observed Height.
3688	7.304	0.547	6.677	6.574
2468	5.133	0.550	5.035	4.750
1818	3.671	0.116	3.055	3.168
119	1.401	0.0114	1.169	1.250

It was found extremely difficult to measure the exact height of the water in the upper stream above the weir. The curvature  $A$  I extended several feet up the stream. Indeed there must be something arbitrary in this measurement, because the surface of the stream is not horizontal. The deviation should be taken, not from a horizontal plane, but from the inclined surface of the river.

It is plain that a river cannot be fitted for continued navigation by weirs. These occasion interruptions; but a few inches may sometimes be added to the waters of a river by a bar, which may still allow a flat bottomed lighter or a raft to pass over it. This is a very frequent practice in Holland and Flanders; and a very

Practical Inferences.

Practical  
Inferences.

cheap and certain conveyance of goods is there obtained by means of streams which we would think no better than boundary ditches, and unfit for every purpose of this kind. By means of a bar the water is kept up a very few inches, and the stream has free course to the sea. The shoot over the bar is prevented by means of another bar placed a little way below it, lying flat in the bottom of the ditch, but which may be raised up on hinges. The lighterman makes his boat fast to a stake immediately above the bar, raises the lower bar, brings over his boat, again makes it fast, and, having laid down the other bar again, proceeds on his journey. This contrivance answers the end of a lock, without trifling expence; and though it does not admit of a sure conveyance, which would otherwise be possible. When the waters can be raised by horse, or that they may be drawn off for machinery or other purposes, they are preferable to weirs, because they do not obstruct floating with rafts, and are not liable to be broken by the ice.

PROB. III. Given the height of a weir, the depth of the water both above and below it, and the width of the river, to determine the discharge.

This is by no means so easily solved as the discharge over a weir, and we cannot do it with the same degree of evidence. We imagine, however, that the following observations will not be very far from a true account of the matter.

We may first suppose a section  $EF$  (fig. 19.) of a river, where  $E$  is a point in the water, and  $F$  is a point in the air. We may then determine, by the foregoing problems, the discharge through the plane  $EC$ . With respect to the discharge through the part  $CA$ , it should be equal to the product of the part of the section by the velocity corresponding to the fall  $EC$ , which is the difference of the heights of water above and below the bar; for, because the difference of  $Ea$  and  $Ca$  is equal to  $EC$ , every particle  $a$  of water in the plane  $CA$  is pressed in the direction of this stream with the same force, viz. the weight of the column  $EC$ . The sum of these discharges should be the whole discharge over the bar; but since the bar is set up across a running river, its discharge must be the same with that of the river. The water of the river, when it comes to the place of the bar, has acquired some velocity by its slope or other causes, and this corresponds to some height  $FE$ . This velocity, multiplied by the section of the river, having the height  $EB$ , should give a discharge equal to the discharge over the bar.

To avoid this complication of conditions, we may first compute the discharge of the bar in the manner now pointed out, without the consideration of the previous velocity of the stream. This discharge will be a little too small. If we divide it by the section  $FB$ , it will give a primary velocity too small, but not far from the truth. Therefore we shall get the height  $FE$ , by means of which we shall be able to determine a velocity intermediate between  $IG$ , and  $CH$ , which would correspond to a weir, as also the velocity  $CH$ , which corresponds to the part of the section  $CA$ , which is wholly under water. Then we correct all these quantities by repeating the operation with them instead of our first assumptions.

Mr Buat found this computation extremely near the

VOL. XVI. Part I.

truth, but in all cases a little greater than observation exhibited. Practical Inferences

We may now solve the problem in the most general terms.

PROB. IV. Given the breadth, depth, and the slope of a river, if we suppose the passage by a bar or weir of a known height, to determine the rise of the water above the bar.

The discharge of the channel being given, the velocity and the quantity of water passing over the weir, by the preceding problem, will be known. From the heights above the wastboard. From the known depth of the river, deduct the ordinary depth of the river. The remainder is the rise of the water.

EXAMPLE. Suppose a river whose ordinary depth is 3 feet, and whose slope is  $1\frac{1}{2}$  inches in 100 fathoms. Suppose a weir on this river 6 feet high, and 10 feet wide.

We must first find the velocity and discharge of the river in its natural state, we have  $l = 480$  inches,  $b =$

$10 = 1000$ . Our formula of uniform motion gives

$V = 23.45$ , and  $D = 405216$  cubic inches.

The contraction obtains here on the three sides of the orifice. We may therefore take  $\sqrt{2G} = 26.1$ . — N. B. This example is Mr Buat's, and all the measures are French. We have also  $a$  (the height of the weir)  $72$ , and  $2g = 724$ . Therefore the equation  $b = \left(\frac{D}{0.431\sqrt{2G}}\right) \div \left(\frac{D}{\sqrt{2g(a+h)}}\right)^2$  becomes  $30.182$ .

Add this to the height of the weir, and the depth of the river above the sluice is  $102.182 = 8$  feet and  $6.182$  inches. From this take 3 feet, and there remains 5 feet and  $6.182$  inches for the rise of the waters.

There is, however, an important circumstance in this rise of the waters, which must be distinctly understood before we can say what are the interesting effects of this weir. This swell extends, as we all know, to a considerable distance up the stream, but is less sensible as we go away from the weir. What is the distance to which the swell extends, and what increase does it produce in the depth at different distances from the weir?

If we suppose that the slope and the breadth of the channel remain as before, it is plain, that as we come down the stream from that point where the swell is insensible, the depth of the channel increases all the way to the dam. Therefore, as the same quantity of water passes through every section of the river, the velocity must diminish in the same proportion (very nearly) that the section increases. But this being an open stream, and therefore the velocity being inseparably connected with the slope of the surface, it follows, that the slope of the surface must diminish all the way from that point where the swell of the water is insensible to the dam. The surface, therefore, cannot be a simple inclined plane, but must be concave upwards, as represented in fig. 20. where  $FKLB$  represents the channel of a river, and  $FB$  the surface of the water running in it. If this be kept up to  $A$  by a weir  $AL$ , the surface will be a curve  $FIA$ , touching the natural surface  $F$  at the beginning of the swell, and the line  $AD$  which touches it in  $A$  will have the slope  $S$  corresponding to the velocity which the waters have immediately before going over the weir. We know this slope, because we

Practical  
Inferences.

are suppose to know the discharge of the river and its slope and other circumstances before barring it with a dam; and we know the height of the dam H, and therefore the new velocity at A, or immediately above A, and consequently the slope S. Therefore, drawing the horizontal lines DC, AG, it is plain that CB and CA will be the primary slope of the river, and the slope S corresponding to the velocity in the immediate neighbourhood of A, because these verticals have the same horizontal distance DC. We have therefore  $CB : CA :: S : s$  very nearly, and  $S - s : s :: CB - CA : CA$ ,  $= AB$  (nearly) : CA. Therefore  $CA = \frac{AB \times s}{S - s}$ .

H.  
s-

But  $DA = CA \times S$ , by our definition of slope; therefore  $DA = \frac{H \cdot S \cdot s}{S - s}$ .

This is all that we can say with precision of this curve. Mr Buat examined what would result from supposing it an arch of a circle. In this case we should have  $DA = DF$ , and AF very nearly equal to  $2 AD$ ; and as we can thus find AD, we get the whole length FIA of the swell, and also the distances of any part of the curve from the primitive surface FB of the river; for these will be very nearly in the duplicate proportion of their distances from F. Thus ID will be  $\frac{1}{2}$  of AB, &c. Therefore we should obtain the depth I d of the stream in that place. Getting the depth of the stream, and knowing the discharge, we get the velocity, and can compare this with the slope of the surface at F. This should be the slope of that part of the arch of the circle. Making this comparison, he found these circumstances to be incompatible. He found that the section and swell at I, corresponding to an arch of a circle, gave a discharge nearly  $\frac{1}{2}$  too great (they were as 405216 to 492142). Therefore the curve is such, that AD is greater than DF, and that it is more incurvated at F than at A. He found, that making DA to DF as 10 to 9, and the curve FIA an arch of an ellipse whose longer axis was vertical, would give a very nice correspondence of the sections, velocities, and slopes. The whole extent of the swell therefore can never be double of AD, and must always greatly surpass AD; and these limits will do very well for every practical question. Then we are making  $DF \frac{9}{10}$  of AD, and drawing the chord AD, and making  $DI \frac{1}{2}$  of D; we shall be very near the truth. Then we get the swell with sufficient precision for any point H between F and D, by making  $FD : FH :: ID : Hh$ ; and if H is between D and A, we get its distance from the tangent DA by a similar process.

Only remains to determine the swell produced in the course of a river by the erection of a bridge or cleaning sluice which contracts the passage. This requires the solution of

PROB. V. Given the depth, breadth, and slope of a river, to determine the swell occasioned by the piers of a bridge or sides of a cleaning sluice, which contract the passage by a given quantity, for a given length of channel.

This swell depends on two circumstances:

1. The whole river must pass through a narrow space, with a velocity proportionably increased; and this requires a certain head of water above the bridge.
2. The water, in passing the length of the piers with

a velocity greater than that corresponding to the primary slope of the river, will require a greater slope in order to acquire this velocity.

Let V be the velocity of the river before the erection of the bridge, and K the quotient of the width of the river divided by the sum of the widths between the piers. If the length of the piers or their dimension in the direction of the stream, is not very great, KV will nearly express the velocity of the river under the arches; and if we suppose for a moment the contraction (in the sense hitherto used) to be nothing, the height producing this velocity will be  $\frac{K^2 V^2}{2g}$ . But the river will not rise so high, having already a slope and velocity before getting under the arches, and the height corresponding to this velocity is  $\frac{V^2}{2g}$ ; therefore the height for producing the augmentation of velocity is  $\frac{K^2 V^2}{2g}$ .

But if we make allowance for contraction we must employ a  $2G$  less than  $2g$ , and we must multiply the height now found by  $\frac{2g}{2G}$ . It will then become  $\left( \frac{K^2 V^2}{2g} - \frac{V^2}{2g} \right) \frac{2g}{2G} = \frac{V^2}{2G} (K^2 - 1)$ . This is that part of the swell which must produce the augmentation of velocity.

With respect to what is necessary for producing the additional slope between the piers, let  $g$  be the natural slope of the river (or rather the difference of level in the length of the piers) before the erection of the bridge, and corresponding to the velocity V;  $K^2 g$  will very nearly express the difference of superficial level for the length of the piers, which is necessary for maintaining the velocity, KV through the same length. The increase of slope therefore is  $K^2 g - g = g (K^2 - 1)$ . Therefore the whole swell will be  $\left( \frac{V^2}{2G} + g \right) (K^2 - 1)$ .

These are the chief questions or problems on this subject which occur in the practice of an engineer; and the solutions which we have given may in every case be depended on as very near the truth, and we are confident that the errors will never amount to one-fifth of the whole quantity. We are equally certain, that of those who call themselves engineers, and who, without hesitation, undertake jobs of enormous expence, not one in ten is able even to guess at the result of such operations, unless the circumstances of the case happen to coincide with those of some other project which he has executed, or has distinctly examined; and very few have the sagacity and penetration necessary for appreciating the effects of the distinguishing circumstances which yet remain. The society established for the encouragement of arts and manufactures could scarcely do a more important service to the public in the line of their institution, than by publishing in their Transactions a description of every work of this kind executed in the kingdom, with an account of its performance. This would be a most valuable collection of experiments and facts. The unlearned practitioner would find among them something which resembles in its chief circumstances almost any project which could occur to him in

tention to  
the subject  
is recom-  
mended.

Practical  
Inferences.

his business, and would tell him what to expect in the case under his management; and the intelligent engineer, assisted by mathematical knowledge, and the habit of classing things together, would frequently be able to frame general rules. To a gentleman qualified as was the Chevalier de Buat, such a collection would be inestimable, and might suggest a theory as far superior to his as he has gone before all other writers.

Modes of  
making  
small rivers  
and brooks  
fit for in-  
land navi-  
gation.

We shall conclude this article with some observations on the methods which may be taken for rendering small rivers and brooks fit for inland navigation, or at least for floatage. We get much instruction on this subject from what has been said concerning the swell produced in a river by weirs, bars, or any diminution of its former section. Our knowledge of the form which the surface of this swell affects, will furnish rules for spacing these obstructions in such a manner, and at such distances from each other, that the swell produced by one shall extend to the one above it.

If we know the slope, the breadth, and the depth of a river, in the droughts of summer, and have determined on the height of the flood-gates, or keeps, which are to be set up in its bed, it is evident that their stations are not matters of arbitrary choice, if we would derive the greatest possible advantage from them.

Some rivers in Flanders and Italy are made navigable in some sort by simple sluices, which, being shut, form magazines of water, which, being discharged by opening the gates, raises the inferior reach enough to permit the passage of the craft which are kept on it. After this momentary rise the keeps are shut again, the water sinks in the lower reach, and the lighters which were floated through the shallows are now obliged to draw into those parts of the reach where they can lie afloat till the next supply of water from above enables them to proceed. This is a very rude and imperfect method, and unjustifiable at this day, when we know the effect of locks, or at least of double gates. We do not mean to enter on the consideration of these contrivances, and to give the methods of their construction, in this place, but refer our readers to what has been already said on this subject in the articles CANAL, LOCK, NAVIGATION (*Inland*), and to what will be said in the article WATER-WORKS. At present we confine ourselves to the single point of husbanding the different falls in the bed of the river, in such a manner that there may be everywhere a sufficient depth of water; and, in what we have to deliver on the subject, we shall take the form of an example to illustrate the application of the foregoing rules.

Suppose then a river 40 feet wide and 3 feet deep in the droughts of summer, with a slope of 1 in 4800. This, by the formula of uniform motion, will have a velocity  $V = 23\frac{1}{2}$  inches per second, and its discharge will be 405216 cubic inches, or 234 feet. It is proposed to give this river a depth not less than five feet in any place, by means of flood-gates of six feet high and 18 feet wide.

We first compute the height at which this body of 234 feet of water will discharge itself over the flood-gates. This we shall find by Prob. II. to be 30 feet, to which adding 72, the height of the gate, we have 102 feet for the whole height of the water above the

floor of the gate; the primitive depth of the river being 3 feet, the rise or swell 5 feet 6 inches. In the next place, we find the range or sensible extent of this swell by Prob. I. and the observations which accompany it. This will be found to be nearly 9177 fathoms. Now since the primitive depth of the river is three feet, there is only wanted two feet of addition; and the question is, relative to the finding what point of the curved surface of the swell is two feet above the tangent plane at the head of the swell? or how far this point is from the gate? The whole extent being 9177 fathoms, and the deviations from the tangent plane being nearly in the duplicate ratio of the distances from the point of contact, we may institute this proportion  $562:9177::9177:5526$ . The last term is the distance (from the head of the swell) of that part of the surface which is two feet above the primitive surface of the river. Therefore 9177—5526, or 3651 fathoms, is the distance of this part from the flood-gate; and this is the distance at which the gates should be placed from each other. No inconvenience would arise from having them nearer, if the banks be high enough to contain the waters; but if they are farther distant, the required depth of water cannot be had without increasing the height of the gates; but if reasons of convenience should induce us to place them nearer, the same depth may be secured by lower gates, and no additional height will be required for the banks. This is generally a matter of moment, because the raising the water brings along with it the chance of flooding the adjoining fields. Knowing the place where the swell ceases to be sensible, we can keep the top of the intermediate flood-gate at the precise height of the curved surface of the swell by means of the proportionality of the deviations from the tangent to the distances from the point of contact.

But this rule will not do for a gate which is at a greater distance from the one above it than the 3651 fathoms already mentioned. We know that a higher gate is required, producing a more extensive swell; and the one swell does not coincide with the other, although they may both begin from the same point A (fig. 21.) Nor will the curves even be similar, unless the thickness of the sheet of water flowing over the gate be increased in the same ratio. But this is not the case; because the produce of the river, and therefore the thickness of the sheet of water, is constant.

But we may suppose them similar without erring more than two or three decimals of an inch; and then we shall have  $AF:AL::FF:DL$ ; from which, if we take the thickness of the sheet of water already calculated for the other gates, there will remain the height of the gate BL.

By following these methods, instead of proceeding by random guesses, we shall procure the greatest depth of water at the smallest expence possible.

But there is a circumstance which must be attended to, and which, if neglected, may in a short time render all our works useless. These gates must frequently be open in the time of freshes; and as this channel then has its natural slope increased in every reach by the great contraction of the section in the gates, and also rolls along a greater body of water, the action of the stream on its bed must be increased by the augmentation of velocity which these circumstances will produce:

Practical  
Inferences.

Practical  
Inferences.

and although we may say that the general slope is necessarily secured by the cills of the flood gates, which are paved with stone or covered with planks, yet this will not hinder this increased current from digging up the bottom in the intervals, undermining the banks, and lodging the mud and earth thus carried off in places where the current meets with any check. All these consequences will assuredly follow if the increased velocity is greater than what corresponds to the regimen relative to the soil in which the river flows on its course.

112  
and of local circum-  
stances,

In order therefore to procure durability to works of this kind, which are generally of enormous expense, the local circumstances must be most scrupulously studied. It is not the ordinary hurried survey of an engineer that will free us from the risk of our navigation becoming very troublesome by the rise of the water, being diminished from their former quantity, and banks formed at a small distance below every sluice. We must attentively study the nature of the soil, and discover experimentally the velocity which is not inconsistent with the permanency of the channel. If this be not a great deal less than that of the river when accelerated by freshes, the regimen may be preserved after the establishment of the gate, and no great changes in the channel will be necessary: but if, on the other hand, the natural velocity of the river during its freshes greatly exceeds what is consistent with stability, we must enlarge the width of the channel, that we may diminish the hydraulic mean depth, and along with this the velocity. Therefore, knowing the quantity discharged during the freshes, divide it by the velocity of regimen, or rather by a velocity somewhat greater (for a reason which will appear by and by), the quotient will be the area of a new section. Then taking the natural slope of the river for the slope which it will preserve in this enlarged channel, and after the cills of the flood gates have been fixed, we must calculate the hydraulic mean depth, and then the other dimensions of the channel. And, lastly, from the known dimensions of the channel and the discharge (which we must now compute), we proceed to calculate the height and the distances of the flood gates, adjusted to their widths, which must be regulated by the room which may be thought proper for the free passage of the lighters which are to ply on the river. An example will illustrate the whole of this process:—

113  
illustrated  
by an ex-  
ample.

Suppose then a small river having a slope of 2 inches in 100 fathoms or 3600, which is a very usual declivity of such small streams, and whose depth in summer is 2 feet, but subject to floods which raise it to nine feet. Let its breadth at the bottom be 18 feet, and the base of its sloping sides  $\frac{1}{2}$  of their height. All of these dimensions are very conformable to the ordinary course of things. It is proposed to make this river navigable in all seasons by means of keeps and gates placed at proper distances; and we want to know the dimensions of a channel which will be permanent, in a soil which begins to yield to a velocity of 80 inches per second, but it will be safe under a velocity of 24.

The primitive channel having the properties of a rectangular channel, its breadth during the freshes must be  $B = 30$  feet, or 360 inches, and its depth  $b$  9 feet or 108 inches; therefore its hydraulic mean depth

$$d = \frac{Bb}{B+2b} = 61,88 \text{ inches. Its real velocity there-}$$

Practical  
Inferences.

fore, during the freshes, will be 38,9447 in and its discharge 1514169 cubic inches, or 876 $\frac{1}{2}$  cubic feet per second. We see therefore that the natural channel will not be permanent, and will be very quickly destroyed or changed by this great velocity. We have two methods for procuring stability, viz. diminishing the slope, or widening the bed. The first method will require the course to be lengthened in the proportion of 24 to 3988, or nearly of 36 to 100. The expense of this would be enormous. The second method will require the hydraulic mean depth to be increased nearly in the same proportion (because the velocities are nearly as  $\sqrt{d}$ ). This will evidently be much less cost-

ly, and, even to procure convenient room for the navigation, must be preferred.

We must now observe, that the great velocity, of which we are afraid, obtains only during the winter floods. If therefore we reduce this to 24 inches, it must happen that the autumnal freshes, loaded with sand and mud, will certainly deposit a part of it, and choke up our channel below the flood gates. We must therefore select a mean velocity somewhat exceeding the regimen, that it may carry off these depositions. We shall take 27 inches which will produce this effect on the loose mud without endangering our channel in any remarkable degree.

Therefore we have, by the theorem for uniform motion,  $V = 27 = \frac{297(\sqrt{d} - 0,1)}{\sqrt{5} - 1\sqrt{5} + 1,6} = 0,3(\sqrt{5} - 0,1)$ . Calculating the divisor of this formula, we find it = 55,884. Hence  $\sqrt{d} - 0,1 = \frac{27 \text{ inch.}}{55,884} = 0,483$

5,3843, and therefore  $d = 30,71$ . Having thus determined the hydraulic mean depth, we find the area  $S$  of the section by dividing the discharge 1514169 by the velocity 27. This gives us 56080,368. Then we get the breadth  $B$  by the formula formerly given,  $B = \sqrt{\left(\frac{S}{2d}\right)^2 - 2S} + \frac{S}{2d} = 1802,296$  inches, or 150,19 feet, and the depth  $b = 31,115$  inches.

With these dimensions of the section we are certain that the channel will be permanent; and the cills of the flood gates being all fixed agreeable to the primitive slope, we need not fear that it will be changed in the intervals by the action of the current. The gates being all open during the freshes, the bottom will be cleared of all deposited mud.

We must now station the flood gates along the new channel, at such distances that we may have the depth the flood of water which is proper for the lighters that are to be gates, &c. employed in the navigation. Suppose this to be four feet. We must first of all learn how high the water will be kept in this new channel during the summer droughts. There remained in the primitive channel only 2 feet, and the section in this case had 20 feet 8 inches mean width; and the discharge corresponding to this section and slope of  $\frac{1}{2}$  is, by the theorem of uniform motion, 130,849 cubic inches per second. To find

114

Practical  
Inferences.

find the depth of water in the new channel corresponding to this discharge, and the same slope, we must take the method of approximation formerly exemplified, remembering that the discharge D is 130849, and the breadth B is 1760.8 at the bottom (the slant sides being  $\frac{1}{2}$ ). These data will produce a depth of water = 6 $\frac{1}{2}$  inches. To obtain four feet therefore behind any of the flood-gates, we must have a swell of 41 $\frac{1}{2}$  inches produced by the gate below.

We must now determine the width of passage which must be given at the gates. This will regulate the thickness of the sheet of water which flows over them when shut; and this, with the height of the gate, fixes the swell at the gate. The extent of this swell, and the elevation at every point of its curved surface above the new surface of the river, requires a combination of the height of swell at the flood-gate, with the primitive slope and the new velocity. These being computed, the stations of the gates may be assigned, which will secure four feet of water behind each in summer. We need not give these computations, having already exemplified them all with relation to another river.

This example not only illustrates the method of proceeding, so as to be ensured of success, but also gives us a precise instance of what must be done in a case which cannot but frequently occur. We see what a prodigious excavation is necessary, in order to obtain permanency. We have been obliged to enlarge the primitive bed to about twice its former size, so that the excavation is at least two-thirds of what the other method required. The expence, however, will still be vastly inferior to the other, both from the nature of the work and the quantity of ground occupied. At all events, the expence is enormous, and what could never be repaid by the navigation, except in a very rich and populous country.

There is another circumstance to be attended to.—The navigation of this river by sluices must be very desultory, unless they are extremely numerous, and of small heights. The natural surface of the swell being concave upwards, the additions made by its different parts in the primitive height of the river decrease rapidly as they approach to the place A (fig. 20), where the swell terminates; and three gates, each of which raises the water one foot when placed at the proper distance from each other, will raise the water much more than two gates at twice this distance, each raising the water two feet. Moreover, when the elevation produced by a flood-gate is considerable, exceeding a very few inches, the fall and current produced by the opening of the gate is such, that no boat can possibly pass up the river, and it runs imminent risk of being overset and sunk, in the attempt to go down the stream. This renders the navigation desultory. A number of lighters collect themselves at the gates, and wait their opening. They pass through as soon as the current becomes moderate. This would not, perhaps, be very hurtful in a regulated navigation, if they could then proceed on their voyage. But the boats bound up the river must stay on the upper side of the gate which they have just now passed, because the channel is now too shallow for them to proceed. Those bound down the river can only go to the next gate, unless it has been opened at a time nicely adjusted to the opening of the one above it. The passage

Practical  
Inferences.

downwards may, in many cases, be continued, by very intelligent and attentive lockmen, but the passage up must be exceedingly tedious. Nay, we may say, that while the passage downwards is continuous, it is but in a very few cases that the passage upward is practicable. If we add to these inconveniences the great danger of passage during the furies, while all the gates are open, and the immense and unavoidable accumulations of ice, on occasion even of slight frosts, we may see that this method of procuring an inland navigation is amazingly expensive, desultory, tedious, and hazardous. It did not therefore merit, on its own account, the attention we have bestowed on it. But the discussion was absolutely necessary, in order to show what must be done in order to obtain effect and permanency, and thus to prevent us from engaging in a project which, to a person not duly and confidently informed, is so feasible and promising. Many professional engineers are ready, and with honest intentions, to undertake such tasks; and by avoiding this immense expence, and contenting themselves with a much narrower channel, they succeed, (witness the old navigation of the river Mersey). But the work has no duration; and, not having been found very serviceable, its cessation is not matter of much regret. The work is not much spoken of during its continuance. It is soon forgotten, as well as its failure, and engineers are found ready to engage for such another.

It was not a very refined thought to change this imperfect mode for another free from most of its inconveniences. A boat was brought up the river, through one of these gates, only by raising the waters of the inferior reach, and depressing those of the upper: and it could not escape observation, that when the gates were far asunder, a vast body of water must be discharged before this could be done, and that it would be a great improvement to double each gate, with a very small distance between. Thus a very small quantity of water would fill the interval to the desired height, and allow the boat to come through; and this thought was the more obvious, from a similar practice having preceded it, viz. that of navigating a small river by means of double bars, the lowest of which lay flat in the bottom of the river, but could be raised up on hinges. We have mentioned this already; and it appears to have been an old practice, being mentioned by Stevinus in his valuable work on sluices, published about the beginning of the last century; yet no trace of this method is to be found of much older dates. It occurred, however, accidentally, pretty often in the flat countries of Holland and Flanders, which being the seat of frequent wars, almost every town and village was fortified with wet ditches, connected with the adjoining rivers. Stevinus mentions particularly the works of Condé, as having been long employed, with great ingenuity, for rendering navigable a very long stretch of the Scheldt. The boats were received into the lower part of the fosse, which was separated from the rest by a stone bastardeau, serving to keep up the waters in the rest of the fosse about eight feet. In this was a sluice and another dam, by which the boats could be taken into the upper fosse, which communicated with a remote part of the Scheldt by a long canal. This appears to be one of the earliest locks.

In the first attempt to introduce this improvement in the

the navigation of rivers already kept up by weirs, which gave a partial and interrupted navigation, it was usual to avoid the great expence of the second dam and gate, by making the lock altogether detached from the river, within land, and having its basin parallel to the river, and communicating by one end with the river above the weir, and by the other end with the river below the weir, and having a flood-gate at each end.— This was a most ingenious thought; and it was a prodigious improvement, free from all the inconveniences of currents, ice, &c. &c. It was called a *Schleuse*, or lock, with considerable propriety; and this was the origin of the word *sluice*, and of our application of its translation *lock*. This practice being once introduced, it was not long before engineers found that a complete separation of the navigation from the bed of the river was not only the most perfect method for obtaining a sure, easy, and uninterrupted navigation, but that it was in general the most economical in its first construction, and subject to no risk of deterioration by the action of the current, which was here entirely removed. Locked canals, therefore, have almost entirely supplanted all attempts to improve the natural beds of rivers; and this is hardly ever attempted except in the flat countries, where they can hardly be said to differ from horizontal canals. We therefore close with these observations this article, and reserve what is yet to be said on the construction of canals and locks for the article *Navigation-Works*.

216  
Concluding  
observations  
to the  
reader.

We beg leave, however, to detain the reader for a few moments. He cannot but have observed our anxiety to render this dissertation worthy of his notice, by making it practically useful. We have on every occasion appealed, from all theoretical deductions, however specious and well supported, to fact and observation of those spontaneous phenomena of nature which are continually passing in review before us in the motion of running waters. Resting in this manner our whole doctrines on experiment, on the observation of what really happens, and what happens in a way which we cannot or do not fully explain, these spontaneous operations of nature came insensibly to acquire a particular value in our imagination. It has also happened in the course of our reflections on these subjects, that these phenomena have frequently presented themselves to our view in groups, not less remarkable for the extent and the importance of their consequences than for the simplicity, and frequently the seeming insignificance, nay frivolity, of the means employed. Our fancy has therefore been sometimes warmed with the view of a something; an

*Ens agitans molem, et magno se corpore miscens.*

This has sometimes made us express ourselves in a way that is susceptible of misinterpretation, and may even lead into a mistake of our meaning.

We therefore find ourselves obliged to declare, that by the term *Nature*, which we have so frequently used *con amore*, we do not mean that indefinable idol which the self-conceit and vanity of our neighbours in France have set up of late, and ostentatiously stand on tiptoe to worship. This *ens rationis*, this creature of the imagination, has long been the object of cool contemplation in the closet of the philosopher, and has shared his attention with many other play-things of his ever-working fancy. But she has now become the ob-

Inferences.

ject of a sincere and sound idolatry, being held forth by her zealous high-priests to the refined vanity of man as a sort of mirror, in which he may behold his own cherished features, and admire a beauty of his own composition, painted with the most delicate glow of humanity, and decked out with every ornament with which the courtly fancies of a Voltaire, a Diderot, a Mirabeau, could contrive, to smooth over or to hide all traces of created imperfection. We leave this idol to the worship of her intoxicated and unfortunate votaries. The solemn farce in the church of Notre Dame at Paris was an adoration every way worthy of the divinity, and our horror in reading the description of the ceremonial was not without some allay of pleasure, when we saw among her most active priests an artist, whom we had seen a few years before the *machiniste de l'opera* at St. Peterburgh, and grand-master of the lodge *des Maçons*. We hope to be forgiven the pun, when we say that the ancient fabric which was that day profaned by the *abomination of desolation*, was then in reality the *temple de Notre Dame*. Mr. Brignonzi was, by his profession, a fit successor in the priesthood to those *sages de la France* (such was the appellation that they gave each other), whom we have just now named; and his *Tours de Theatre*, for which we have frequently admired his talents, were a very proper accompaniment to the sense and rule of these *soi-disant* philosophers, who, under the mask of the most refined humanity, habitually practised arts of dishonesty which would have ruined the character of the meanest pedlar. No one will think that we express ourselves too strongly who reflect on the many infamous tricks played by Voltaire to his booksellers. No one will think the charge too harsh, when he learnt that Diderot, after having pretended to the possession of an immense library, and sold it to the empress of Russia for an enormous sum, had to ransack the warehouses of the booksellers of Paris and throughout all Germany, in order to fill his shelves. As for Mirabeau, he surpasses eulogy.

Most assiduous were those apostles in spreading this fanaticism, of which they enjoyed the courtly profits: and we imagine that the employment was as agreeable as it was lucrative; for we cannot suppose that Le Kain had more enjoyment, when fascinating his Parisian audience in the character of Voltaire's Mahomet, than its author felt in the side-box, when grinning to himself, and conscious what a sordid and envious wretch he was, he found himself crowned by the first actresses, and worshipped by the audience as the apostle of philanthropy and universal benevolence.

Such was the worship, such were the priests, of this Gallic idol; and, like their predecessors the Druids, they have made human sacrifices a customary oblation at the shrine. We wonder at these things, and are surprised that any thing which can even be nicknamed *philosophy* can produce such effects. But the task of this apostleship was as easy as it was agreeable. It was not the work of a day; it was the completion of a studied corruption of principles, which is now above a century old. We may say that it began under the clever but infamous Dubois; who from being the valet de chambre of an infirm bishop, became cardinal, and sovereign of the Gallic church, and almost of the state. When objected to by the bigotted Louis XIV. (on a presentation for preferment) as a Jansenist, "*Oh qui non?*" said the duke of Orleans, "*Oh, Sire, qui non, il n'est qu'athée.*"

Practical  
Inferences.

*qu'athée."* He was at the utmost pains to bring into the court every man of eminent talents in gay literature, and of licentious principles in religion and morals, whom he employed in corrupting the minds of the young courtiers, and giving them favourable impressions of the indulgence which they might expect from him when he should have the sole direction of affairs. This system was most assiduously pursued during that most licentious and dissolute administration of the regent Orleans, who was himself a specimen of elegant sensuality not to be matched in the annals of the world. Long before the present day, all thinking men in France saw the mummery of the church, and groaned under its oppression; and having no other notions of religion but what they were accustomed to from their cradle, no wonder that they discarded the principle along with those detestable accessories. The nation, therefore, being greedy of flattery, buoyed up by a self-conceit, in which even the ancient Greeks have not surpassed them, and having been thus studiously corrupted, and long immersed in a luxurious and refined sensuality, of which we in this nation have not yet acquired an adequate idea, was fully prepared for feeling all the effects of this fanaticism of NATURALISM.

But this idolatry we abhor. It shocks our reason; and, although it may at first seem to flatter our thoughtless vanity, it really debases our nature, by taking from us our intellectual kindred to the mind of perfect wisdom. Who would not feel pleasure in being the relation of a Bacon, of a Newton, or would thank the man who detected the false pedigree? It puts an end to our fond hopes, that the day will come when we shall surpass in understanding, in worth, and in felicity, the wisest, the best, and the most fortunate of our species.

We cannot but lament the appearances, however faint, of this fanaticism among ourselves. We cannot but observe, that some of the hired directors of public opinion in matters of taste and science have of late showed a wonderful tenderness for the bold and licentious opinions in religion, morals, and politics, which are daily pouring in upon us from the presses of Paris. Perhaps they may be incited to this conduct by the success of their brother journalists in that profligate metropolis; and may hope to be one day, like them, the directors of the public councils and the sovereigns of the nation. We trust, however, that the better part of the reflecting natives of Britain will not allow themselves to be sneered out of their highest boast and their sweetest comforts; namely, that they are not the chance fragments of a

fatal chaos, but the beautiful productions of a wonderful Artist, and the darling objects of his care: and we assure ourselves that ten thousands of our countrymen are ready to rally under the banners of true religion and sound philosophy, and to follow the steps of a Clarke, a Butler, a Newton, and a Boyle, who so eminently distinguished themselves in the cause of Nature's God.

By NATURAL, then, we mean that admirable system of general laws, by which the adored Author and Governor of the universe has thought fit to connect the various parts of this wonderful and goodly frame of things, and to regulate all their operations.

We are not afraid of continually appealing to the laws of Nature: and as we have already observed in the article PHILOSOPHY, we consider these general laws as the most magnificent displays of Infinite Wisdom, and the contemplation of them as the most cheering employment of our understandings.

*Ignescit illis vigor et caelestis origo  
Seminibus.*

At the same time we despise the cold-hearted philosopher who stops short here, and is satisfied (perhaps inwardly pleased) that he has completely accounted for every thing by the laws of unchanging Nature; and we suspect that this philosopher would analyze with the same frigid ingenuity, and explain by irresistible *causes*, the tender attachment of her whole breast he sucked, and who by many anxious and sleepless nights preserved alive the pining infant. But let us rather listen to the words of him who was the most sagacious observer and the most faithful interpreter of Nature's law, our illustrious countryman Sir Isaac Newton. He says,

"Elegantissima hæc rerum compages non nisi consilio et dominio entis sapientissimi et potentissimi oriri potuit. Omnia, simili constructa consilio, subeunt *unius* dominio. Hæc omnia regit, non ut *antiqui cuncti*, sed ut universorum dominus. Propter dominum suum, dominus deus *παισκατωρ* mincipatur. Deus ad servientes respicit, et *deitas* est dominio dei, non in eo quod proprium, ut sentiunt quibus. Deus est Natura seu anima mundi, sed in servos. Deus summus est ens æternum, infinitum, absolute perfectum. Ens utique perfectum, at sine dominio, non est dominus Deus.

"Hunc cognoscimus, solummodo per proprietates ejus et attributa. Attribuuntur ut ex phenomenis dignoscuntur. Phenomena sunt sapientissimæ et optimæ rerum structure, etque causæ finales.—Hunc admiramur ob perfectiones: hunc veneramur et celamus ob dominium" (B).

*RIVER.*

(B) Our readers will probably be pleased with the following list of authors who have treated professedly of the motions of rivers: Guglielmini *De Fluvii et Castellis Aquarum—Danubius Illustratus*; Grandi *De Causis Fluvii*; Zondrini *De Motu Aquarum*; Trinius *De Fluvii*; Tacchi *Idrostatica e Idraulica*; Michelotti *Spaccato Idraulico*; Belidor's *Architecture Hydraulique*; Bossut *Hydrodynamique*; Buat *Hydraulique*; Scherischlag *Theorie des Fleuves*; Lettres de M. L'Epineasse au P. Frisi touchant sa Theorie des Fleuves; Tullien *des principes des Rivières du Monde*, par Genet; Stevins *sur les Ecluses*; *Traité des Ecluses*, par Boulaud, qui a remporté le Prix de l'Acad. de Lyons; Bleiswick *Dissertatio de Aggeribus*; Bossut et Viallet *sur la Construction des Digues*; Simon *Hydrostatica*; Thelman van der Horst *Theatrum Mathematicarum Universale*; De la Lande *sur les Canaux de Navigation*; Racolta di Autori *del Trattato del Moto dell'Acqua*, 3 tom. 4to, Firenze 1723. This most valuable collection contains the writings of Archimedes, Albizi, Gallico, Castelli, Michelini, Borelli, Montanari, Viviani, Cassini, Guglielmini, Grandi, Manfredi, Picard, and Narducci; and an account of the numberless works which have been carried on in the embankment of the Po.

River  
||  
Road.

**RIVER Water.** This is generally much softer and better accommodated to economical purposes than spring water. For though rivers proceed originally from springs, yet, by their rapid motion, and by being exposed during a long course to the influence of the sun and air, the earthy and metallic salts which they contain are decomposed, the acid flies off, and the terrestrial parts precipitate to the bottom. Rivers are also rendered softer by the vast quantity of rain water, which, passing along the surface of the earth, is conveyed into their channels. But all rivers carry with them a great deal of mud and other impurities; and, when they flow near large and populous towns, they become impregnated with a number of heterogeneous substances, in which state the water is certainly unfit for the purposes of life; yet, by remaining for some time at rest, all the feculencies subside, and the water becomes sufficiently pure and potable.

**RIVERS (Earl).** See **WODEVILLE**.

**RIVINIA**, in botany: A genus of the monogynia order, belonging to the tetrandria class of plants.—The perianth is four-leaved, coloured, and permanent, the leaflet oblong-egg'd and obtuse; there is no corolla, unless the calyx be considered as such. There are four or eight filaments, shorter than the calyx, approaching by pairs, permanent; the anthers are small. The germ is large and roundish; the style very short; the stigma simple and obtuse. The berry is globular, sitting on the green reflected calyx, one-celled with an incurved point. There is one seed, lensform and rugged. This plant is called *Solonoides* by Tournefort, and *Piercea* by Miller. It grows naturally in most of the islands of the West Indies. The juice of the berries of the plant will stain paper and linen of a bright red colour, and many experiments made with it to colour flowers have succeeded extremely well in the following manner: the juice of the berries was pressed out, and mixed with common water, putting it into a phial, shaking it well together for some time, till the water was thoroughly tinged; then the flowers, which were white and just fully blown, were cut off, and their stalks placed into the phial; and in one night the flowers have been finely variegated with red; the flowers on which the experiments were made were the tuberosc, and the double white narcissus.

**RIVULET**, a diminutive of river. See **RIVER**.

**ROACH**, in ichthyology. See **CYRINUS**.

**ROAD**, an open way, or public passage, forming a communication between one place and another.

Of all the people in the world the Romans took the most pains in forming roads; and the labour and expences they were at in rendering them spacious, firm, straight, and smooth, are incredible. They usually strengthened the ground by ramming it, laying it with flints, pebbles, or sands, and sometimes with a lining of masonry, rubbish, bricks, &c. bound together with mortar. In some places in the Lyonois, F. Menestrier observes, that he has found huge clusters of flints cemented with lime, reaching 10 or 12 feet deep, and making a mass as hard and compact as marble; and which, after resisting the injuries of time for 1600 years, is still scarce penetrable by all the force of hammers, mattocks, &c. and yet the flints it consists of are not bigger than eggs. The most noble of the Roman roads was the *Via Appia*, which was carried to such a

vast length, that Procopius reckons it five days journey to the end of it, and Leipsius computes it at 350 miles; it is 12 feet broad, and made of square free-stone generally a foot and a half on each side; and though this has lasted for above 1800 years, yet in many places it is for several miles together as entire as when it was first made.

The ancient roads are distinguished into military roads, double roads, subterraneous roads, &c. The military roads were gravel roads, formed by the Romans for marching their armies into the provinces of the empire; the principal of these Roman roads in England are Watling-street, Ikenild-street, Foss-way, and Erminage-street. Double roads among the Romans, were roads for carriages, with two pavements, the one for those going one way, and the other for those returning the other: these were separated from each other by a causeway raised in the middle, paved with bricks, for the conveniency of foot passengers; with borders and mounting stones from space to space, and miliar columns to mark the distance. Subterraneous roads are those dug through a rock, and left vaulted, as that of Puzzuoli near Naples, which is near half a league long, and is 15 feet broad and as many high.

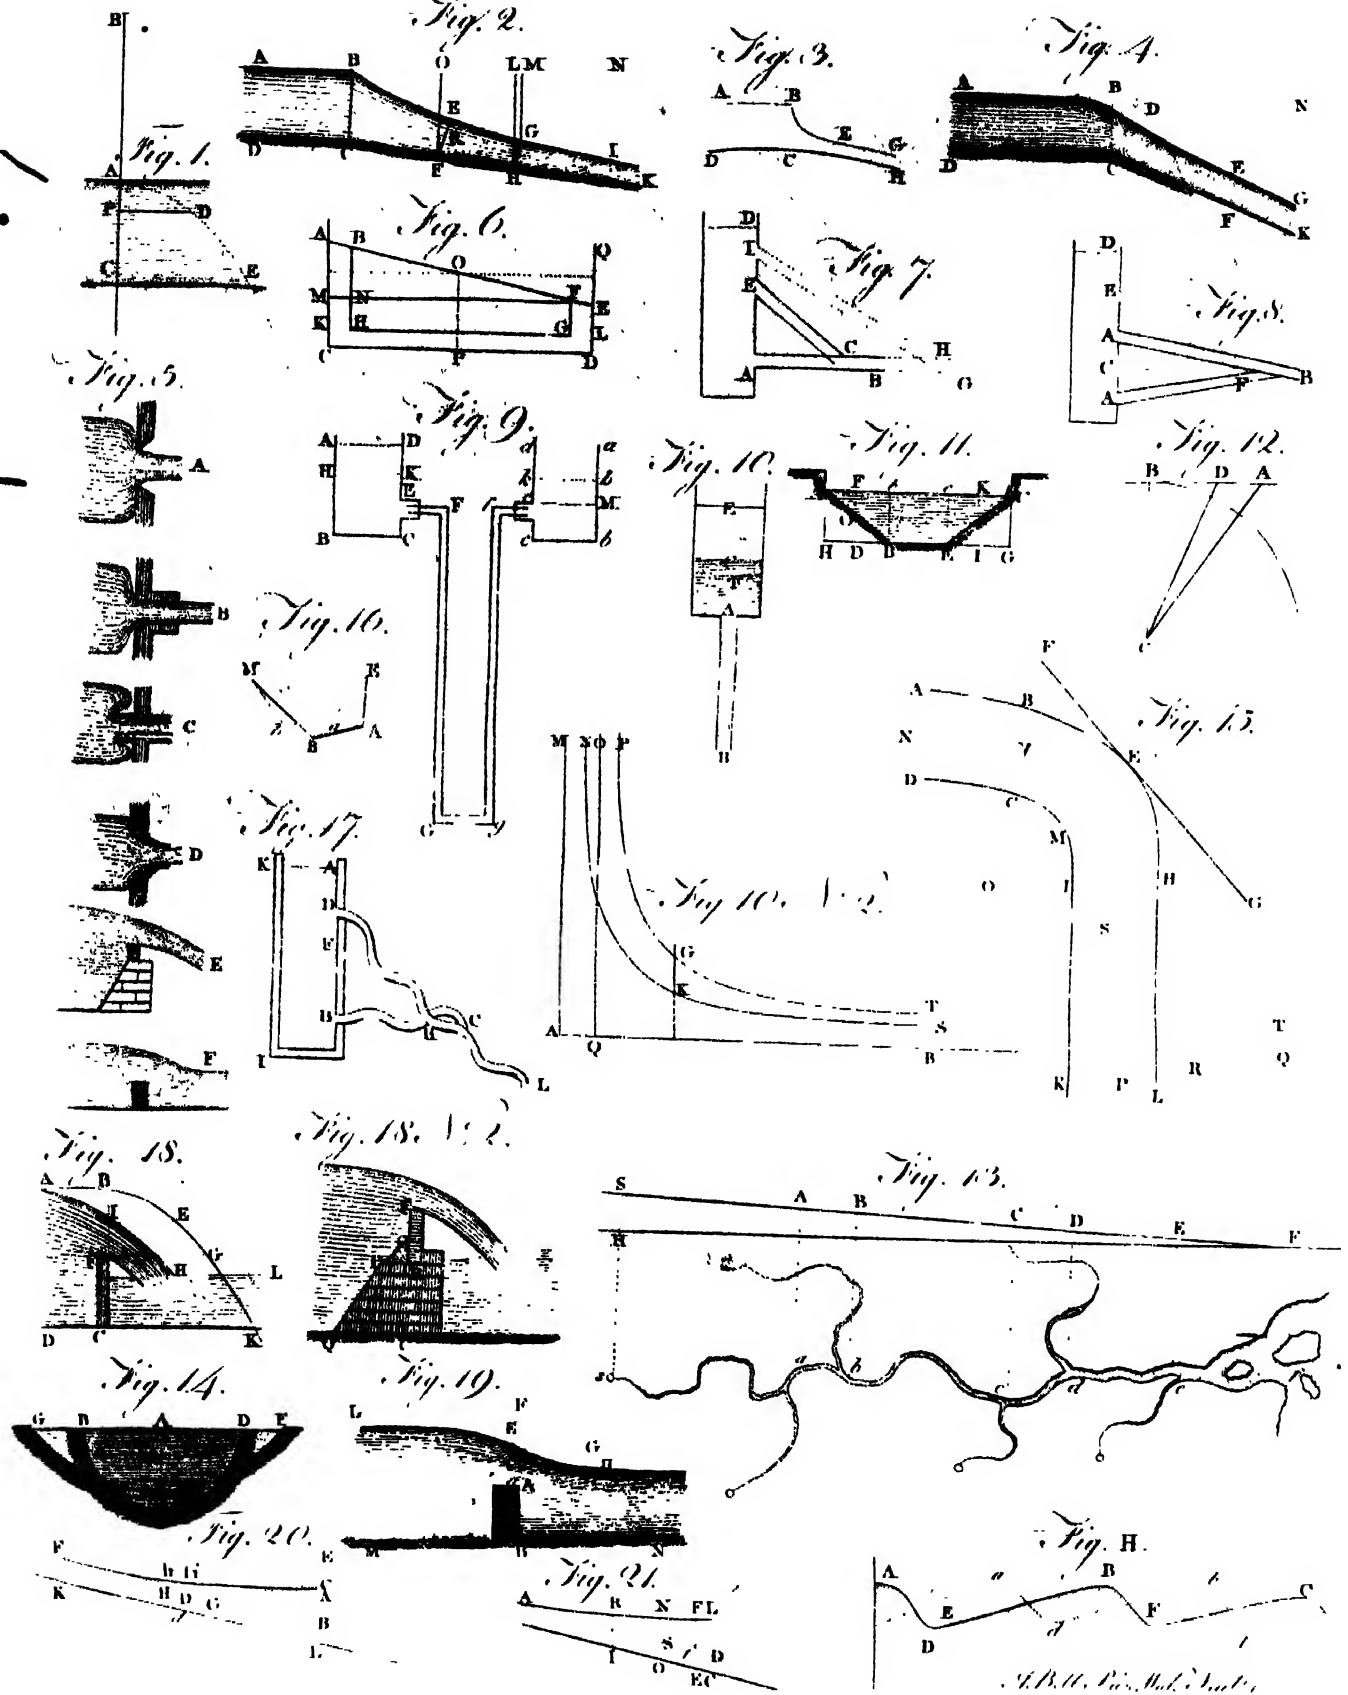

The first law enacted respecting highways and roads in England was in the year 1285; when the lords of the soil were enjoined to enlarge those ways where bushes, woods, or ditches be, in order to prevent robberies. The next law was made by Edward III. in the year 1346; when a commission was granted by the king to lay a toll on all sorts of carriages passing from the hospital of St Giles in the fields to the bar of the Old Temple, and also through another highway called *Portpool* (now Gray's Inn Lane) joined to the before-named highway; which roads were become almost impassable. Little further relating to this subject occurs, till the reign of Henry VIII. when the parishes were intrusted with the care of the roads, and surveyors were annually elected to take care of them. But the increase of luxury and commerce introduced such a number of heavy carriages for the conveyance of goods, and lighter ones for the convenience and ease of travelling, that parish aid was found insufficient to keep the best frequented roads in repair. It is introduced toll-gates or turnpikes; that something might be paid towards their support by every individual who enjoyed the benefit of these improvements, by passing over the roads.

Speaking of roads, the Abbé Raynal justly remarks, "Let us travel over all the countries of the earth, and wherever we shall find no facility of trading from a city to a town, and from a village to a hamlet, we may pronounce the people to be barbarians; and we shall only be deceived respecting the degree of barbarism."

**ROAD**, in navigation, a bay, or place of anchorage, at some distance from the shore, whither ships or vessels occasionally repair to receive intelligence, orders, or necessary supplies; or to wait for a fair wind, &c. The excellence of a road consists chiefly in its being protected from the reigning winds and the swell of the sea; in having a good anchoring-ground, and being at a competent distance from the shore. Those which are not sufficiently enclosed are termed *open roads*.

**ROAN**, in the manage. A *roan* horse is one of a bay,

Road,  
Roan.

Roanok  
Robbery.

bay, sorrel, or black colour, with gray or white spots interspersed very thick. When this party-coloured coat is accompanied with a black head and black extremities, he is called a *roan horse with a black-a-moor's head*: and if the same mixture is predominant upon a deep sorrel, he is called a *claret roan*.

ROANOAK, an island of North America, near the coast of North Carolina. Here the English first attempted to settle in 1585, but were obliged to leave it for want of provisions. E. Long. 75. *q. N. Lat.* 35. 40.

ROANOAK, a river of North America, which rises in Virginia, runs through Carolina, and at length falls into the sea, where it forms a long narrow bay called *Albemarle sound*.

ROASTING, in metallurgic operations, signifies the distillation of the volatile parts of an ore by heat. See METALLURGY, *art.*

ROB, in pharmacy, the juices of fruits pressed and inspissated till it is of the consistence of honey.

ROBBERY, the *rapina* of the civilians, is the felonious and forcible taking, from the person of another, of goods or money to any value, by violence or putting him in fear. 1. There must be a taking, otherwise it is no robbery. A mere attempt to rob was indeed held to be felony so late as Henry IVth's time; but afterwards it was taken to be only a misdemeanour, and punishable with fine and imprisonment; till the statute 7. Geo. II. *c. 21.* which makes it a felony (transportable for seven years) unlawfully and maliciously to assault another, with any offensive weapon or instrument, or by menace, or by other forcible or violent means, to demand any money or goods, — with a felonious intent to rob. If the thief, having once taken a purse, returns to fill it is a robbery; and so is whether the taking be strictly from the person of another, or in his presence only; as where a robber by menaces and violence puts a man in fear, and drives away his sheep or his cattle before his face. 2. It is immaterial of what value the thing taken is: a penny, as well as a pound thus forcibly extorted, makes a robbery. 3. Lastly, The taking must be by force, or a previous putting in fear; which makes the violation of the person more atrocious than privately stealing. For, according to the maxim of the civil law, "*qui vi capuit, fur improbius esse videtur.*" This previous violence, or putting in fear, is the criterion that distinguishes robbery from other larcenies. For if one privately steals sixpence from the person of another, and afterwards keeps it by putting him in fear, this is no robbery, for the fear is subsequent: neither is it capital as privately stealing, being under the value of twelve-pence. Not that it is indeed necessary, though usual, to lay in the indictment that the robbery was committed by putting in fear: it is sufficient, if laid to be done by violence. And when it is laid to be done by putting in fear, this does not imply any great degree of terror or affright in the party robbed: it is enough that so much force or threatening, by word or gesture, be used, as might create an apprehension of danger, or induce a man to part with his property without or against his consent. Thus, if a man be knocked down without previous warning, and stripped of his property while senseless, though strictly he cannot be said to be put in fear, yet this is undoubtedly a robbery. Or, if a per-

son with a sword drawn begs an alms, and I give it him through mistrust and apprehension of violence, this is a felonious robbery. So if, under a pretence of sale, a man forcibly extorts money from another, neither shall this subterfuge avail him. But it is doubted, whether the forcing a higler, or other chapman, to sell his wares, and giving him the full value of them, amounts to so heinous a crime as robbery.

This species of LARCENY is debarred of the benefit of clergy by statute 23 Hen. VIII. *c. 1.* and other subsequent statutes; not indeed in general, but only when committed in a dwelling house, or in or near the king's highway. A robbery therefore in a distant field, or footpath, was not punished with death; but was open to the benefit of clergy, till the statute 3 & 4 W. and M. *c. 9.* which takes away clergy from both principals and accessories before the fact, in robbery, wheresoever committed. See LAW, N<sup>o</sup> cxxxvi. 30.

ROBERT BRUCE, king of Scotland, in 1306; a renowned general, and the deliverer of his country from a state of vassalage to the English. See SCOTLAND.

ROBERT, king of France, surnamed the Wise and the Pious, came to the crown in 996, after the death of Hugh Capet his father. He was crowned at Orleans, the place of his nativity, and afterwards at Rheims, after the imprisonment of Charles of Lorraine. He married Bertha his cousin, daughter of Conrad king of Burgundy; but the marriage was declared null by Gregory V.; and the king, if we can give credit to Cardinal Peter Damien, was excommunicated. This anathema made such a noise in France, that all the king's courtiers, and even his very domestics, went away from him. Only two continued with him; who were so deeply impressed with a sense of horror at whatever the king touched, that they purified it with fire: this scruple they carried so far, as to the very plates on which he was served with his meat, and the vessels out of which he drank. The same cardinal reports, that as a punishment for this pretended incest, the queen was delivered of a monster, which had the head and neck of a duck. He adds, that Robert was so struck with astonishment at this species of prodigy, that he lived apart from the queen. He contracted a second marriage with Constance, daughter of William count of Arles and Provence: but the arrogant disposition of this princess would have totally overturned the kingdom, and thrown it into confusion, had not the wisdom of the king prevented her from intermeddling with the affairs of the state. He carefully concealed from her whatever acts of liberality he showed to any of his domestics. "Take care (said he to them) that the queen don't perceive it."—Henry duke of Burgundy, brother of Hugh Capet, dying in 1002, without lawful issue, left his dukedom to his nephew the king of France. Robert invested his second son Henry with this dukedom, who afterwards coming to the crown, resigned it in favour of Robert his cadet. This duke Robert was chief of the first royal branch of the dukes of Burgundy, who flourished till 1361. This dukedom was then re-united to the crown by King John, who gave it to his fourth son Philip the Bold, chief of the second house of Burgundy, which was terminated in the person of Charles the Rash, who was slain in 1477. King Robert was so much esteemed for his wisdom and prudence, that

Robert.

**Robert.** he was offered the empire and kingdom of Italy, which, however, he declined to accept. Hugh, called the *Great*, whom he had by Constance, being dead, he caused his second son Henry I. to be crowned at Rheims. He died at Melun, July 20. 1031, at the age of 60. Robert was, according to the knowledge of the times, a wise prince. Helgand, friar of Fleury, relates, in his life of him, that, to prevent his subjects from falling into the crime of perjury, and incurring the penalties which followed thereon, he made them swear upon a shrine from which the relics had been previously removed, as if intention did not constitute perjury! and long after similar reasoning was adopted. Robert built a great number of churches, and procured a restitution to the clergy of the tithes and wealth which the lay-lords had made themselves masters of. The depredations were such, that the laity possessed the ecclesiastical treasures by hereditary titles; they divided them among their children; they even gave benefices as a dowry with their daughters, or left them to their sons as lawful inheritance. Although Robert was pious, and although he respected the clergy, yet it was evident that he opposed the bishops with a firmness and resolution of which, for many ages, they had had no examples. Lutheric archbishop of Sens had introduced into his diocese the custom of proving by the eucharist persons accused as guilty of any crime. The king wrote to him in the following strong terms: "I swear (says he) by the faith I owe to God, that if you do not put a stop to the gross abuse complained of, you shall be deprived of your priesthood." The prelate was forced to comply. He punished, in 1022, the Manichæens, canons of Orleans, by burning them at the stake. There are, however, recorded of him some less severe actions, which it is right to mention. A dangerous conspiracy against his person and government having been discovered, and the authors taken into custody, he seized the moment when their judges had met to sentence them to death, to cause an elegant repast to be served up to them. Next day they were admitted to the eucharist. Then Robert told them, that he gave them their pardon, "because none of those can die whom Jesus Christ came to receive at his table." One day when he was at prayers in the chapel, he perceived a thief, who had cut off the half of the fringe of his mantle, proceeding to take the remainder; "Friend (says he with a pleasant countenance), be content with what you have already taken, the rest will very well serve some other." Robert cultivated, and was a patronizer of the sciences. There are several hymns wrote by him, which still continue to be sung in the church. His reign was happy and tranquil. According to some authors, he instituted the order of the Star, commonly attributed to King John.

**ROBERT of France**, second son of Louis VIII. and brother to St Louis, who erected in his favour Artois into a royal peerage in the year 1237. It was during this time that the unlucky difference between Pope Gregory IX. and the emperor Frederic II. took place. Gregory offered to St Louis the empire for Robert; but the French noblesse, having met to deliberate on this proposal, were of opinion that he ought to reject it. He gave the pope for answer: "That Count Robert esteemed himself sufficiently honoured by being the brother of a king, who surpassed in dignity, in

strength, in wealth, and in birth, all other monarchs in the world." Robert accompanied St Louis into Egypt, and fought with more bravery than prudence at the battle of Maffoure, on the 9th of February 1250. In his pursuit of the cowards through a certain small village, he was killed by stones, sticks, and other things which they threw at him from the windows. He was an intrepid prince, but too passionate, dogmatical, and quarrelsome.

**ROBERT II. Count of Artois**, son of the preceding, surnamed the Good and the Noble, was at the expedition into Africa in 1270. He drove the rebels from Navarre in 1276. He brought a very powerful assistance to Charles I. king of Naples, of which kingdom he was regent during the captivity of Charles II. He defeated the Arragonians in Sicily in 1289, the English near Bayonne in 1296, and the Flemish at Furnes in 1298. But having in 1302 imprudently attempted to force these last, when encamped near Courtray, he received no less than 30 wounds; and in that expedition lost both his honour and his life. He was a brave, but passionate and fierce man, and good at nothing but pugilistic encounters. Mahaud his daughter inherited the dukedom of Artois, and gave herself in marriage to Otho duke of Burgundy, by whom she had two daughters, Jane wife of Philip the Long, and Blanche wife of Charles the Fair. In the mean time Philip, son of Robert II. had a son.

**ROBERT III.** who disputed the dukedom of Artois with Mahaud his aunt; but he lost his suit by two sentences given in against him in 1301 and 1311. He wished to revive the process in 1329, under Philip of Valois, by means of pretended new titles, which were found to be false. Robert was condemned the same time, and banished the kingdom in 1331. He then found an asylum with Edward III. king of England, he undertook to declare him king of France, which proved the cause of those long and cruel wars which distressed that kingdom. Robert was wounded at the siege of Vannes in 1342, and died of his wound in England. John, son to Robert, and count of Eu, was taken prisoner at the battle of Poitiers in 1356, and terminated his career in 1387. His son Philip II. high constable of France, carried on war in Africa and Hungary, and died in 1397, being a prisoner of the Turks. He had a son named Charles, who died in 1472, leaving no issue.

**ROBERT of Anjou**, surnamed the Wise, third son of Charles the Lame, succeeded his father in the kingdom of Naples in 1309, by the protection of the popes, and the will of the people, to the exclusion of Charobert son of his eldest brother. He aided the Roman pontiffs against the emperor Henry VII. and, after the death of that prince, was nominated in 1313 vicar of the empire in Italy, in temporal matters, until a new emperor was elected. This title was given him by Clement V. in virtue of a right which he pretended to have to govern the empire during an interregnum. Robert reigned with glory 33 years, eight months, and died on the 19th of January 1343, aged 64. "This prince (says M. De Montigni) had not those qualities which constitute heroes, but he had those which make good kings. He was religious, affable, generous, kind, wife, prudent, and a zealous promoter of justice." He was called the *Solomon* of his age. He loved the poor, and

**Robert.**

**Robert.** and caused a ticket to be placed upon his palace, to give notice when he meant to distribute from the throne. He had no other passion but a very great love for learning. He used to say, that he would rather renounce his crown than his study. His court soon became the sanctuary of the sciences, which he encouraged equally by his example and his bounty. This prince was versed in theology, jurisprudence, philosophy, mathematics, and medicine. Boccace says, "that since the days of Solomon we have not seen so wise a prince upon the throne." For a great part of his life he had no taste for poetry; he even despised it; as, in his opinion, unworthy of a man of learning. A conversation which he had with Petrarch, however, undeceived him; he retained this poet at his court, and attempted himself to write some poems, which are still extant. He was forced to engage a little in war, for which he possessed no great talent; alluding to which, may be seen on his thanks a wolf and a lamb drinking out of the same vessel. Philip of Valois refused from giving battle in 1339, by the repeated advice which this prince gave him, who was a great friend to France, both from inclination and interest. He detested quarrels among Christian princes, and had studied the science of astrology, not so much to know the course of the stars, as to learn by this chimerical science the hidden things of futurity. He believed that he read in the grand book of heaven a very great misfortune which would befall France if Philip hazarded a battle against the English.

**Robert the First**, called the Magnificent, duke of Normandy, second son of Richard I. succeeded in 1189 his brother Richard I. whom it is reported he poisoned. He had early in his reign to suppress frequent rebellions of several of the great vassals. He was established in his estates Baudouin IV. count of Flanders, who had been unjustly stripped of his possessions by his own son. He forced Canute king of Denmark, who was also king of England, to divide his possessions with his cousins Alfred and Edward. In the year 1033, he undertook barefooted a journey to the Holy Land; on his return from which he died, being poisoned at Nice in Bithynia, leaving as his successor William his natural son, afterwards king of England, whom he had caused before his departure to be publicly acknowledged in an assembly of the states of Normandy.

**ROBERT**, or *Rupert*, surnamed the Short and the Mild, elector Palatine, son of Robert the Niggardly, was born in 1352, and elected emperor of Germany in 1400, after the deposition of the cruel Wenceslas. In order to gain the affection of the Germans, he wished to restore the Milanese to the empire, which Wenceslas had taken from it; but his attempts in this respect were unsuccessful. His attachment to the anti-pope Gregory XII. entirely alienated the affections of the German princes. To such a degree were they incensed against him, that they entered into a conspiracy to cut him off; but his death, which happened on the 28th of May 1410, being then 58 years old, put a stop to their machinations. Robert began to settle the sovereignty of the German princes. The emperors had formerly retained in their own hands the power of life and death, within the territories of a great many of the nobles; but he yielded to them this right by his letters patent.—The chief fault imputed to this prince was an excess of

lenity. But, if we consider the plots which he had to detect, the conspiracies which he had to frustrate, the secret and powerful enemies he had to deal with; if we inquire also into the commotions which the wicked administration of Wenceslas had excited, the irruptions and devastations of plunderers and highway robbers, which the nobles contumacious, and the distressed situation in which he found Germany, we must without hesitation conclude, that his lenity indicated his prudence, in restoring by slow degrees the empire to its original tranquillity. Robert had his virtues, he loved his subjects, and governed them with wisdom. Possessed of much political knowledge for the age in which he lived, he wanted nothing but talents for war to make him an accomplished prince. He was twice married. The name and rank of his first wife is unknown; he had by her a son, who died before him. His second wife was Elizabeth, daughter of Frederic burgrave of Nuremberg, by whom he had five sons and three daughters. The three daughters were, Margaret married to Charles duke of Lorraine; Agnes to Adolphus duke of Cleves; Elizabeth to Frederic duke of Austria. His sons were, Louis the first of the electoral branch, which became extinct in 1559; John father of Christopher king of Denmark; Frederic who died without issue; Otho count of Sinsheim; lastly, Stephen, from whom descended the elector, and the other counts palatine of the Rhine, who are extant at this day.

**ROBERT** (of Bavaria), prince palatine of the Rhine, and duke of Cumberland, the son of Frederic, elector palatine, by Elizabeth, daughter of James I. king of England, distinguished himself by his valour as a general and admiral; first in the Dutch, and then in the English service. He was unsuccessful in the cause of his uncle Charles I. against the parliament forces; but under Charles II. he defeated the Dutch fleet, and was made lord high admiral of England in 1673. This prince was a lover of the sciences, and particularly skillful in chemistry. He died in 1682.

**ROBERTSON** (Dr William), one of the most celebrated historians of his age, was one of those great characters whose private life, flowing in an even and unvaried stream, can afford no important information to the biographer, although his writings will be read to the latest posterity with undiminished pleasure. He was born at the manse of Borthwick in the year 1721. His father was, at the time of his death, one of the ministers of the Old Grey Friars church in Edinburgh, which the Doctor came afterwards to supply. In 1743 he was licensed preacher, and placed in the parish of Gladsmuir in 1744; whence, in 1758, he was translated to Lady Yester's parish in Edinburgh. In 1761, on the death of Principal Goldie, he was elected principal of the university of Edinburgh, and appointed one of the ministers of the Old Grey Friars church. About this period he received the degree of Doctor of Divinity, and was appointed historiographer to his majesty for Scotland, and one of his majesty's chaplains for that kingdom.

We find it not easy to ascertain at what period were first unfolded the great and singular talents which destined Dr Robertson to be one of the first writers that rescued this island from the reproach of not having any good historians. We are, however, assured, that before the publication of any of his literary performances,

Robertson. even from his first appearance in public life, his abilities had begun to attract the notice of observing men; and to his more intimate friends he discovered marks of such high-minded ambition, as, seconded by those abilities, could not have failed to carry him to the first honours of his profession, in whatever sphere he had been placed, and whatever opposition he might have had to combat.

The first theatre that offered for the display of his talents, was the General Assembly of the Church of Scotland. It is the annual meeting of this court that produce to view men who would otherwise remain in the deepest obscurity. There the humblest pastor, whose lot has been cast in the remotest corner of the Highland wilds, feels himself, for a time, on a footing of equality with the first citizen in the kingdom: he can there dispute with him the prize of eloquence, the most flattering distinction to a liberal mind; a distinction which is naturally sought after with the greater eagerness in that assembly, as the simple establishment of the church of Scotland has rendered it the only pre-eminence to which the greatest part of its members can ever hope to attain.

From the moment Dr Robertson first appeared in this assembly, he became the object of universal attention and applause. His speeches were marked with the same manly and persuasive eloquence that distinguishes his historical composition; and it was observed by all, that while his young rivals in oratory contented themselves with opening a cause, or delivering a studied harangue, he showed equal ability to start objections, to answer, or to reply, and that even his most unpremeditated effusions were not unadorned with those harmonious and seemingly measured periods, which have been so much admired in his works of labour and reflection. He soon came to be considered as the ablest supporter of the cause he chose to espouse, and was now the unvalued leader of one of the great parties which have long divided the church of which he was a member.

When we reflect upon this circumstance, and consider how much mankind are the same in every society, we shall be the less surprised to find, in the literary works of Dr Robertson, an acquaintance with the human heart, and a knowledge of the world, which we look for in vain in other historians. The man who has spent his life in the difficult task of conducting the deliberations of a popular assembly, in regulating the passions, the interests, the prejudices, of a numerous faction, has advantages over the pedant, or mere man of letters, which no ability, no study, no second-hand information, can ever compensate.

The first work which extended the Doctor's reputation beyond the walls of the general assembly, was a sermon preached at Edinburgh before the society for propagating Christian knowledge, and afterwards published; the subject of which was, 'The state of the world at the appearance of Jesus Christ.' The ingenuity with which a number of detached circumstances are there collected, and shown to tend to one single point, may perhaps rival the art which is so much admired in the bishop of Meaux's celebrated Universal History.

This sermon did great honour to the author, and it is probably to the reputation he gained by it, that we

ought to attribute the unanimity with which he was called to be one of the ministers of Edinburgh—an event which happened not long after, viz. in the year 1758. In 1759, he published, in two volumes quarto, 'The History of Scotland, during the reigns of Queen Mary and of King James VI. till his Accession to the Crown of England, with a Review of the Scots History previous to that period.' This work in its structure is one of the most complete of all modern histories. It is not a dry jejune narrative of events, destitute of ornament; nor is it a mere frothy relation, all glow and colouring. The historian discovers a sufficient store of imagination to engage the reader's attention, with a due proportion of judgment to check the exuberance of fancy. The arrangement of his work is admirable, and his descriptions are animated. His style is copious, nervous, and correct. He has displayed consummate skill in rendering such passages of our history as are familiar to our recollection, agreeable and entertaining. He has embellished old materials with all the elegance of modern dress. He has very judiciously avoided too circumstantial a detail of trite facts. His narratives are succinct and spicily his reflections copious, frequent, and generally pertinent. His sentiments respecting the guilt of Mary have indeed been warmly controverted by Messrs Tytler, Stuart, and Whitaker; and the general opinion now seems to be, that their victory is complete. That victory, however, on the part of Whitaker, is sullied by the acrimony with which he writes. Dr Robertson was no rancorous or malignant enemy of the unfortunate queen. While relating what he doubtless believed, he makes every possible allowance for Mary from the circumstances in which she was placed; and his history will be read with pleasure by members of all parties as long as the language in which it is composed shall continue to be understood.

In 1769, Dr Robertson published, in three volumes quarto, 'The History of the Reign of the Emperor Charles V. with a View of the Progress of Society in Europe, from the Subversion of the Roman Empire to the beginning of the 16th century.—The vast and general importance of the period which this history comprises, together with the reputation which our historian had deservedly acquired, co-operated to raise such high expectations in the public, that no work perhaps was ever more impatiently wished for, or perused with greater avidity. The first volume (which is a preliminary one, containing the progress of society in Europe, as mentioned in the title) is a very valuable part of the work; for it serves not only as a key to the pages that follow, but may be considered as a general introduction to the study of history in that period in which the several powers of Europe were formed into one great political system, in which each took a station, wherein it has since remained (till within a very few years at least) with less alterations than could have been expected, after the shocks occasioned by so many internal revolutions, and so many foreign wars. Of the history itself, it may be sufficient to observe, that it is justly ranked among the capital pieces of historical excellence. There is an elegance of expression, a depth of discernment, and a correctness of judgment, which do honour to the historian. The characters are inimitably penned. They are not contrasted by a studied antithesis, but by an opposition which results from a very

py union of strength and grace which becomes the majesty of the historic muse. In the fourth book of his first volume, which contains a description of America when first discovered, and a philosophical inquiry into the manners and policy of its ancient inhabitants, he displays, moreover, so much patient investigation and loved philosophy, abounds in such beautiful or interesting descriptions, and exhibits such variety and copiousness of eloquence, that future times will probably prize it as one of his works which gives the highest idea of his power, and is the most finished of all.

In 1779, Dr Robertson published *The History of America*, in two volumes quarto. This celebrated work may be considered with great propriety as a sequel to the preceding history. From the close of the 15th century we date the most splendid era in the annals of modern times. Discoveries were then made, the influence of which descended to posterity, and events happened that gave a new direction to the progress of science.

To the inhabitants of Europe, America appeared as a new world. There the face of the earth changed its appearance. The plants and trees and animals were strange, and unknown to the natives. A continent appeared as if it had recently come from the hands of the Creator, and was a flowery lake, river, and mountain, a garden, and a vegetable kingdom, a more fertile and more fertile than the other quarters of the globe. The animal tribes in a state of degradation, but in numbers, represented in kind, imperfection, and weakness, the human species in the earliest stage of civilization, and numerous nations in the most form of the savage, like which philosophers have contemplated, and two great empires in the lowest degree of civilization which any nation have attained to our times, dedicated to the religious eye at this period the most fearful subject of speculation that was to be found in the annals of

the new world, moreover, was not only a subject of interest to the philosopher, but, by the progress which it effected, an interesting link to the human race. When Columbus set sail for unknown regions, little expecting that he was to make a revolution in the system of human affairs, and to form the history of Europe for ages to come. The importance and celebrity therefore of the subject had attracted the attention of philosophers and historians. Views and sketches of the new world had been given by able writers, and splendid portions of the American story had been adorned with all the beauties of eloquence. But, prior to the appearance of Dr Robertson's history, no author had bestowed the mature and profound investigation which such a subject required, or had finished upon a regular plan, that complete narrative and perfect whole which, it is the province of the historian to transmit to posterity. And as the subject upon which our author entered was grand, his execution was masterly. The character of his former works was immediately discerned in it. They had been read with uncommon admiration. When the History of Scotland was first published, and the author altogether unknown, Lord Cheffersfield pronounced it to be equal in eloquence and beauty to the productions of Livy, the purest and most classical of all the Roman historians. His literary reputation was not confined to his own country: the testimony of Europe was soon added to the voice of Britain. It may be mentioned, indeed, as the characteristic quality of our author's manner, that he possessed in no common degree that supported elevation which is suitable to compositions of the higher class; and, in his History of America, he displayed that hap-

and a violent arraignment of the Abbé Clavigero, in which work the author shows great personal reflections, tending in several instances to impeach the credit of Dr Robertson's History of America. This attack induced our learned historian to revise his work, and to inquire into the truth of the charges brought against it by the historian of New Spain; and this he appears to have done with a becoming attention to the importance of the facts that are controverted, and to the common interests of truth. The result he published in 1788, under the title of *Additions and Corrections to the former Editions of Dr Robertson's History of America*.—In many of the disputed passages, he fully answered the Abbé Clavigero, and vindicated himself: in others he candidly submitted to correction, and thus gave additional value to his own work.

The literary labours of Dr Robertson appear to have been terminated in 1791 by the publication of *An Historical Disquisition concerning the Knowledge which the Ancients had of India, and the Progress of Trade with that Country prior to the Discovery of the Passage to it by the Cape of Good Hope; with an Appendix, containing Observations on the Civil Polity, the Laws, and Judicial Proceedings, the Arts, the Sciences, and Religious Institutions of the Indians* — The perusal of Major Rennell's Memoir, for illustrating his map of Hindostan, suggested to Dr Robertson the design of examining more fully than he had done, in his *History of America*, into the knowledge which the ancients had of India, and of considering what is certain, what is obscure, and what is fabulous, in their accounts of that remote country. Of his various performances, this is not that of which the design is the most extensive, or the execution the most elaborate; but in this historical disquisition we perceive the same patient assiduity in collecting his materials, the same discernment in arranging them, the same perspicuity of narrative, and the same power of illustration, which so eminently distinguish his other writings, and which have long rendered them the delight of the British reader at home and an honour to British literature abroad.

A truly useful life Dr Robertson closed on the 11th of June 1793, at Grange House, near Edinburgh, after a lingering illness, which he endured with exemplary fortitude and resignation. It may be truly observed of him, that no man lived more respected, or died more sincerely lamented. Indefatigable in his literary researches, and possessing from nature a sound and vigorous understanding, he acquired a store of useful knowledge, which afforded ample scope for the exertion of his extraordinary abilities, and raised him to the most distinguished eminence in the republic of letters. As

Robigus  
Robinia

a minister of the gospel, he was a faithful pastor, and justly merited the esteem and veneration of his flock. In a word, he may be pronounced to be one of the most perfect characters of the age; and his name will be a lasting honour to the island that gave him birth. His conversation was cheerful, entertaining, and instructive; his manners affable, pleasing, and entertaining.

Dr. Robertson left three sons and one daughter. The eldest son is procurator for the church of Scotland, and an advocate. The other two are officers in the army; and one of them distinguished himself as Lord Cornwallis in such a manner as to command the warmest praise from that illustrious general.

**ROBIGUS AND ROBIGO**, a Robigus and Robigo, who joined in the preservation of the same light. Their festival was kept on the 1st of April.

**ROBIN HOOD**. See HOOD.

**ROBIN Red-Breast**. See MOTACILLA.

**ROBINIA**, FALSE ACACIA, in botany; it belongs to the decandria order, belonging to the diadelphia class of plants; and in the natural method ranking under the 32d order, *Papilionaceae*. The calyx is divided; the legumen gibbous and elongated. There are many species. The most remarkable are the caragana and soror, the leaves of the former of which are conjugated, and composed of a number of small folioles, of an oval figure, and ranged by pairs on one common stalk. The flowers are leguminous, and are clustered on a filament. Every flower consists of a small bell-shaped petal, cut into four segments at the edge, the upper part being rather the widest. The keel is small, open, and rounded. The wings are large, oval, and a little raised. Within are 10 stamina united at the base, curved towards the top, and rounded at the summit. In the midst of a sheath, formed by the filaments of the stamina, the pistil is perceivable, consisting of an oval germen, terminated by a kind of button. This germen becomes afterwards an oblong flattish curved pod, containing four or five seeds, of a size and shape irregular and unequal: yet in both respects somewhat resembling a lentil.

This tree grows naturally in the severe climates of Northern Asia, in a sandy soil mixed with black light earth. It is particularly found on the banks of great rivers, as the Oby, Jenisei, &c. It is very rarely met with in the inhabited parts of the country, because cattle are very fond of its leaves, and hogs of its roots; and it is so hardy, that the severest winters do not affect it. Gmelin found it in the neighbourhood of Tobolsk, buried under 15 feet of snow and ice, yet had it not suffered the least damage. Its culture consists in being planted or sowed in a lightish sandy soil, which must on no account have been lately manured. It thrives best near a river, or on the edge of a brook or spring; but presently dies if planted in a marshy spot, where the water stagnates. If it is planted on a rich soil, well tilled, it will grow to the height of 20 feet, and in a very few years will be as big as a common birch tree.

In a very bad soil this tree degenerates, and becomes a mere shrub; the leaves grow hard, and their fine bright green colour is changed to a dull deep green. The Tongusian Tartars, and the inhabitants of the northern parts of Siberia, are very fond of the fruit of this tree, it being almost the only sort of pulse they eat. M. Strahlenberg, author of a well-esteemed description

of Siberia, assures us that this fruit is tolerably pleasant food, and very nourishing. These pease are first infused in boiling water, to take off a certain acrid taste they have, and are afterwards dressed like common pease or Windsor beans; and being ground into meal, pretty good cakes are made of them. The leaves and tender shoots of this tree make excellent fodder for several sorts of cattle. The roots, being sweet and succulent, are very well adapted to fattening hogs; and the fruit is greedily eaten by all sorts of poultry. After several experiments somewhat similar to the methods used with indigo and indigo, a fine blue colour was procured from the leaves. The smaller kind of this tree seems still better adapted to answer this purpose. The striking cleanness of its leaves, joined to the pleasing yellow colour of its flowers, should, one would imagine, be very proper for forming pathways, or for speedily cleaning the streets of cities.

Robins, the name of a tree, it possesses the most rapid manner of growing exceedingly quick, and is very hardy. There are large plantations of it in Sweden, Norway, Lapland, and Finland. Linnæus assures us, that, after the *Pinus foliata*, it is the second most useful tree of Siberia, this tree, or at least one of its varieties, is most worthy of observation.

2. The *Robinia* tree is a beautiful hardy shrub, and, on account of its robust strong prickles, might be introduced into this country as a hedge plant, with much propriety. It is the severest cold of the climate of St. Peterburgh, and perfects its seed in the garden of the emperors there. It rises to the height of 20 or eight feet; does not send out suckers from the root, nor ramble so much as to be without difficulty kept within bounds. Its flowers are yellow, and the leaves are of a light shining green. It is given in the *Fleur Raisée* by Dr. Pallas, who found it in the southern districts, and sent the seeds to St. Peterburgh, where it has prospered in a situation where few plants can be made to live.

**ROBINS** (Benjamin), a most ingenious mathematician, was born at Bath in 1707. His parents were Quakers, and of low condition, consequently neither were nor willing to have him much instructed in human learning. Nevertheless his own propensity to science procured him a recommendation to Dr Pemberton at London; by whose assistance, while he attained the sublimer parts of mathematical knowledge, he commenced teacher of the mathematics. But the business of teaching, which required constant attention, not suiting his active disposition, he gradually declined it, and engaged in business that required more exercise. Hence he tried many laborious experiments in gunnery, from the persuasion that the resistance of the air has a much greater influence on swift projectiles than is generally imagined. Hence also he was led to consider the mechanic arts that depend on mathematical principles; as the construction of mills, the building of bridges, the draining of fens, the rendering of rivers navigable, and the making of harbours. Among other arts, fortification much engaged his attention; and he met with opportunities of perfecting himself by viewing the principal strong places of Flanders, in some tours he made abroad with persons of distinction.

Upon his return from one of these excursions, he found

Robins,  
Robins.

111

with the same view, and which features to bishops and ecclesiastics, persons represented by their successors of churchmen in purchasing plate and houses, or building new houses, originated from this excellent man, and will ever endure in time to the clergy. The other two for separating churches, and facilitating the recovery of ecclesiastical tithes, were among his many happy exertions at the palace.

But it was at Armagh, the ancient seat of the archbishop, that he displayed a princely magnificence. A very elegant palace, 90 feet by 80, and so high as to surpass that town; it is light and pleasing, without the addition of wings or other parts, which too frequently, wanting a sufficient uniformity with the body of the edifice, are unconnected with it in effect, and destroy the association. Large and ample offices are situated, and are behind a plantation at a small distance. In front of the palace is a large lawn, which spreads on every side over the hills, skirted by young plantations, in front of which is a terrace, which commands a most beautiful view of cultivated hill and dale; this view from the palace is much improved by the barracks, the school, and a new church at a distance; all which are so placed as to be exceedingly ornamental to the whole country.

The barracks were erected under the primate's direction, and form a large and handsome edifice. The school is a building of considerable extent, and admirably adapted for the purpose; a more beautiful or better contrived one is nowhere to be seen; there are apartments for a master, a school-room 56 feet by 28, a large dining room and spacious airy dormitories, with every other necessary, and a spacious play-ground walled in; the whole forming a handsome front: and attention being paid to the residence of the master (the salary is 400l. a year), the school flourishes, and must prove one of the greatest advantages to the country. This edifice was built entirely at the primate's expence. The church is erected of white stone, and having a tall spire, makes a very agreeable object, in a country where churches and spires do not abound. The primate built three other churches, and made considerable reparations to the cathedral; he was also the means of erecting a public infirmary, contributing amply to it himself: he likewise constructed a public library at his own cost, endowed it, and gave it a large collection of books; the room is 45 feet by 25, and 20 high, with a gallery and apartments for the librarian. The town he ornamented with a market-house and shambles, and was the direct means, by giving leases upon that condition, of almost new building the whole place. He found it a nest of mud cabins, and he left it a well built city of stone and slate. These are noble and spirited works, in which the primate expended not less than 30,000l. Had this sum been laid out in improving a paternal estate, even then they would be deserving great praise; but it is not for his posterity, but the public good, that his grace was so munificent. A medal was struck by the ingenious William Mossop of Dublin, which has on one side the head of the primate, inscribed "Richard Robinson, Baron Rokeby, Lord Primate of all Ireland." And on the reverse, the south front of the observatory at Armagh, erected by his grace, with this admirable motto, "The Heavens declare the glory of God." MDCLXXXIX.

ROBINSON (Robert), a dissenting minister of consi-

derable note, was born on the 8th of October 1735 at Swaffham in Norfolk. His father died when he was young; and his maternal grandfather, Robert Wilkin, of Mildenhall, Suffolk, gent. who had ever been diffatisfied with his daughter's marriage, deprived him of his maternal inheritance, cutting him off with half-a-guinea. His uncle, however, who was a substantial farmer, in some measure supplied this loss. He took Mr. Robinson home, and placed him under the Rev. Joseph Brett, at Scarning school in Norfolk, with a view to the ministry of the church of England; where he was for one of his school-fellows the Lord Chancellor of Ireland. When about the age of 15 or 16, he imitated the notions of George Whitefield; on which account he was rebuked by his uncle, and again exposed to poverty and want. He first directed his thoughts towards the ministry of the gospel, and commenced preaching in the following year at the age of 20; preaching at first to a congregation of poor people at Swaffham. He continued for a year or two as one of the Whitefield's preachers, and during that period he flourished. In the year 1758, however, he determined to separate from the Methodists; after which he settled at Norwich, where he soon began to preach chiefly of his own mind, being in what is termed independent. In the year 1759 he was invited to Cambridge, and for two years preached on trial to a congregation consisting at one time of 50 people, and for so that they could only sit in a bare room for his subsistence. In June 1761 he settled at the parish, and was ordained in the usual manner; at which time were told he exercised the office of a pastor. In 1764, his congregation had so much increased, as to consist of 1000 souls, including children and servants. In Cambridge Mr. Robinson's talents soon attracted notice, and he quickly set up a Sunday evening school, which was well attended. His preaching was altogether without notes; a method in which he was particularly happy; not by trusting to his memory entirely, nor by working himself up to a degree of warmth and passion, to which the preachers among whom he first appeared commonly owe their ready utterance; but by thoroughly studying and making himself perfectly master of his subject, and a certain facility of expression which is never at a loss for suitable and proper words. In short, his manner was admirably adapted to enlighten the understanding, and to affect and reform the heart. He had such a command of speech, such an easy and apparent method in dividing a discourse, and such a familiar way of reasoning, as discovered a heart filled with the tenderest concern for the meanness of his hearers; and yet there was a decency, propriety, and justness, that the most judicious could not but approve. Several gentlemen of the university, eminent for character and abilities, we are told, were his constant hearers.

The circumstances which lost him his uncle's patronage paved the way for the future events of his life. The incident which made him discard the common sentiments on the subject of baptism, at once marked the turn of his mind, and shows what apparently slight causes frequently determine the lot and usefulness of our lives. He was invited to the baptism of a child; the minister who was to perform the service keeping the company in long expectation of his appearance, some one

Robinson. one suggested, that supposing the child were not baptized at all, he saw not how it could affect his happiness. Though the conversation was not pursued, the hint struck Mr. Robinson's mind; and he immediately determined to read the New Testament with this particular view, to examine what is said concerning the baptism of infants. He accordingly began with the Gospel of Matthew; and, in succession, perused the historical and epistolary books; in expectation that he should find in every following part what he had not met with in the preceding parts of the sacred volume; namely, passages recommending and urging this rite. But, surveying, on the whole, a total silence about it, he thought it his duty to relinquish the practice, as without foundation in the rule of our faith; which appeared to him to speak only of the baptism of believers.

This change of his sentiments was not attended with less than the former alterations in his religious opinions; so his worldly views, and his manner of living, were life from pure reason. He was convinced that the duties for near as great were to be performed in the bridge, as in the more solemn and more numerous, and the support of an aged father, and as of a wife and ten children, required more than But, unexpected success, from a source of which he was ignorant, produced a new and powerful, and confirmed his sense of the duty; and the situation of his family, which was now more than ever, made it his duty to persevere in the practice, which he had just possessed great tenderness and affection for, and he was regarded with peculiar tenderness by his family.

Mr. Robinson's labours in the ministry of mercy, which the Father of the Fatherly family was pleased to bestow upon him, were not less than his labours in the ministry of mercy. He was, of course, and was at first, and, with others, he was the first to begin the beginning of the Denomination, and his labours had far almost everywhere been taken into account, when Mr. Robinson was called to the church at Stone-Yard. His labours and labours, however, raised their reputation. The place, which was great, and which was at first a barn, after the hall and gallery, and then a meeting-house, but still a small and ruinous place, soon became too small for the audience; and several of the new auditors being men of fortune, they purchased the site, and erected at their own expense a new house in the year 1764.

His labours as a preacher were not limited to the town of Cambridge; but soon after his coming there, he set up several lectures in the adjacent villages. His lectures were either annual or occasional, on stated or fixed days. The usual time was half an hour after six in the evening; and sometimes at five in the morning; and now and then in the summer at two in the afternoon, for the sake of those who came from a distance.

He died on the 9th of June 1790, at the house of William Ruffel, Esq; of Showell Green near Birmingham. He had laboured under an alarming disorder for some time before; but on the Sunday preceding his death he preached a charity sermon. On Monday he was seized with a fit; on Tuesday he recovered and went to bed tolerably well, and was found dead next morning.

The abilities of Mr. Robinson were very considerable, as appears from his numerous works; and he possessed Vol. XVI. Part I.

the quality of expressing his thoughts in an easy and forcible manner. But he appears to have been of an unsteady temper, and, in consequence, requires but little credit either from the frequency with which he changed his religious creed, (for we have reason to believe he died a Socinian,) or from the little and undetermined acrimony with which the spirit of the Church of England, and the principles of the Principles of Non-Confession, and the Principles of the Church of England, in a place of the most liberal and liberal minds that we have ever seen, and which have produced the most high and liberal minds.

His labours in the ministry of mercy, which the Father of the Fatherly family was pleased to bestow upon him, were not less than his labours in the ministry of mercy. He was, of course, and was at first, and, with others, he was the first to begin the beginning of the Denomination, and his labours had far almost everywhere been taken into account, when Mr. Robinson was called to the church at Stone-Yard. His labours and labours, however, raised their reputation. The place, which was great, and which was at first a barn, after the hall and gallery, and then a meeting-house, but still a small and ruinous place, soon became too small for the audience; and several of the new auditors being men of fortune, they purchased the site, and erected at their own expense a new house in the year 1764.

ROBORANTS, in pharmacy, medicines which strengthen the parts, and give new vigour to the constitution.

ROCHEFORT, a handsome and considerable town of France in the territory of Aunis. It was constructed by Louis XIV. and is built in the midst of marshes expressly drained for that purpose; and time evinced the utility of the project, for as a port it soon became as necessary and important to the crown of France as Brest or Toulon. It has a department of the marine, and has large magazines of naval stores. There is also one of the finest halls of arms in the kingdom, and a great many workmen employed in making them; there are also forges for anchors, and work-houses for ship-carpenters, who are employed in every thing that relates to the fitting out of ships that come within the compass of their province. They likewise cast great guns here; and have artists, whose employment is sculpture and painting. There are also stocks for building men of war, rope-walks, magazines of provisions and powder, a manufactory of sail-cloth, an hospital for sailors, and proper places to clean the ships. Add to these, the houses of the intendant, the square of the capuchins, and the superb structure which contains lodgings for 300 marine guards, where they are taught the business and exercises belonging to seamen and officers who go on board the men of war.

Beside the usual number of workmen which were employed at Rochefort during the monarchy, which amounted to about 900, there were about 600 gally slaves, occupied in the most painful and laborious branches of service. The town is situated on the river Charente, about five leagues from its mouth, and was fortified by Louis XIV. at the time he constructed it; but its situation is at so considerable a distance from the sea, as to render it sufficiently secure from any attack, and they have therefore closed up the battlements, and neglected the fortifications. The town is laid out with great beauty and elegance. The streets are all very broad and straight, extending through the whole place from side to side; but the buildings do not correspond with them in this respect, as they are mostly low and irregular. W. Long. o. 54. N. Lat. 46. 3.

R 1 ROCHEFOUCAULT

Rochefou-  
cault.

**ROCHEFOUCAULT** (Francis earl of), descended of an illustrious family, next in dignity to that of the sovereigns, was chamberlain to King Charles VIII. and Louis XII. His character at court was admired as obliging, generous, upright, and sincere. In 1494, he stood godfather to Francis I. who, when he came to the throne, continued to pay great respect to that spiritual relation. He made him his chamberlain in ordinary, and erected, in 1515, the duchy of Rochefoucault into an episcopate; and, in his will of religious observation, that he did this in memory of the great, honourable, highly useful, and commendable services which the said Francis had done to his predecessors, to the crown of France, and to himself. The earl of Rochefoucault died in 1517, leaving behind him an illustrious memory, and a character universally respected. Since his time all the eldest sons of that family have taken the name of Francis.

**ROCHEFOUCAULT** (Francis duke de la), prince of Marillac, governor of Poitou, was born in 1603. He was the son of Francis, the first duke of Rochefoucault, and was distinguished equally by his courage and his wit. These shining qualities endeared him to all the nobility at court, who were ambitious of decorating themselves at once with the laurels of Mars and of Apollo. He wrote two excellent works; the one a book of Maxims, which M. de Voltaire says has contributed more than any thing else to form the taste of the French nation; and the other, Memoirs of the Regency of Queen Anne of Austria. It was partly at the instigation of the beautiful duchess de Longueville, to whom he had been long attached, that the duke de Rochefoucault engaged in the civil wars, in which he signalized himself particularly at the battle of St Antoine. Beholding one day a portrait of this lady, he wrote underneath it these two lines from the tragedy of Alcyonée:

*"Pour meriter son cœur, pour plaire à ses beaux yeux,  
"J'ai fait la guerre aux rois, je l'aurois fait aux dieux."*

Which may be thus rendered in English:

*"To gain her heart, and please her sparkling eyes,  
"I've war'd with kings, and would have brav'd the skies."*

It is reported, that after his rupture with Madame Longueville, he parodied the above verses thus:

*"Pour ce cœur inconstant, qu'enfin je connois mieux,  
"Je fais la guerre aux rois, j'en ai perdu les yeux."*

After the civil wars were ended, he thought of nothing but enjoying the calm pleasures of friendship and literature. His house became the rendezvous of every person of genius in Paris and Versailles. Racine, Boileau, Savigne, and La Fayette, found in his conversation charms which they sought for in vain elsewhere. He was not, however, with all his elegance and genius, a member of the French Academy. The necessity of making a public speech the day of his reception was the only cause that he did not claim admittance. This nobleman, with all the courage he had displayed upon various critical occasions, and with his superiority of birth and understanding over the common run of men, did not think himself capable of facing an audience, to utter only four lines in public, without being out of countenance. He died at Paris in 1680, aged 68,

leaving behind him a character which has been variously drawn by those who during his life were proud of his friendship. That he was well acquainted with human nature is certain; and his merit in that respect was fully admitted by Swift, who was himself not easily imposed upon by the artificial disguises of the hypocrite.

**ROCHELLE**, a celebrated city of France, capital of the territory of Aunis, with a very commodious and safe harbour, which, though it does not admit vessels of any considerable burden, is yet well calculated for trade. It may be divided (says Mr Wraxall) into three parts; the basin, which is the innermost of these, is only a quarter of a mile in circumference; and at the entrance are two very noble Gothic towers, called the *Porte de St Nicholas*, and the *Tour de la Chaine*. They are now in a state of decay, but were anciently designed to protect the town and harbour. Without these towers is the *Avant Port*, extending more than a league, and bounded by two points of land to the north and south. Beyond all is the road where the largest ships usually anchor, protected from the south-west winds by the islands of Rhé, Oléron, and Aix. The celebrated mound erected by Richelieu extends from side to side across the whole harbour, nearly an English mile in length, and when the sea rises is five fathoms deep. "I walked out upon it," says Mr Wraxall, "above 200 feet. Its breadth was then more than 120 feet, and it widens continually towards the sea. No effort of art or power can possibly surpass the mind which so vast and sublime an idea of the general of Richelieu, as does this bulwark against the sea. While I stood upon it, in the middle of the port, between the waves which rolled on either side, and contemplated its extent and height, I was almost inclined to suppose that something more to be superior to human power, and the production rather of a deity than of a mortal. A small opening of about 200 feet was left by Pompey Targat, the architect who constructed it, to give entrance to vessels, and shut up by chains fixed across it. A tower was likewise erected at each end, no remains of which are now to be seen. Neither the duke of Buckingham, nor the earl of Lindsey, who were successively sent from England to the aid of the besieged by Charles the First, dared to attack this formidable barrier: they retired, and left Rochelle to its fate. In all probability, a thousand years, aided by storms and all the fury of the sea, will make little or no impression on this mound, which is designed to endure as long as the name of the Cardinal, its author.

Before the Revolution, Rochelle was a bishop's see, and contained a college of humanities, an academy, a school for medicine, anatomy, and botany, and a mint. It claims its claim to any remote antiquity, being merely a little collection of houses on the shore, inhabited by fishermen, when William IX. last count of Poitou, rendered himself master of it in 1139. From this prince it descended to his only daughter Eleanor, afterwards queen of Henry II. of England; and her charter incorporating the town is still preserved in the registers of the city. In the year 1540, Rochelle was the grand asylum of the Protestants; and the massacre at Paris was soon followed by the siege of Rochelle, which began in November 1572, and was raised in June 1573; but in 1628, after a most obstinate resistance, and a siege of 13 months, it surrendered to the

Rochelle.

**Rochester.** the mercy of Louis XIII. At the beginning of the first siege, the number of inhabitants in the city amounted to 72,000; in the second, they diminished to 28,000; and they were, when Mr Wraxal was there, between 17 and 18,000, of which scarce 2000 were Huguenots. The houses of this city are fine, and supported with piazzas, under which persons may walk in all weathers; and the streets in general are as straight as a line. There are several handsome churches, and other structures, besides a remarkable pump in the square of Dauphiny, which throws out the water through several pipes. There are no remains of the old fortifications, except, on the side of the harbour, where there are bulwarks and strong towers to defend the entrance. The new fortifications are in the manner of Vauban. Before Canada was ceded to England, and New Orleans to Spain, the trade of Rochelle was very lucrative. It reviv'd about the year 1773, and, besides that to the coast of Guiana and the East Indies, the merchants carried on a considerable trade in wool, honey, silk, paper, linen cloth, and serge. It is situate on the ocean, in W. Long. 1. 11. N. Lat. 46. 10.

**ROCHESTER**, a city of Kent, in England, is situated on the Medway, seven miles and a half north of Maidstone, and 10 from London. It appears to have been one of the Roman stations, from the bricks in the walls, as well as the Roman coins that have been found about it. It has three parish churches built with stone and flint, besides the cathedral, which is but a mean structure. This little city, which was made a bishopric also by King Ethelbert, anno 602, has met with many calamities. In 1002, it was sacked by Edward the Elder; in 1016, by King Canute; and 1066, by the Danes. In 1066, King Alfred. About 100 years since, it was besieged by King Edward, and forced to surrender. In 1066, it was taken and plundered by the Danes. Anno 1088 it was besieged and taken by William Rufus. In King John's time it was taken from the barons, after three months siege; and the very next year, viz. 1216, its castle, founded by William the Conqueror, was stormed and taken by several of the barons, under the French king's son. In the reign of Henry III. it was besieged by Simon Montfort, who burnt its then wooden bridge and tower, and spoiled the church and priory, and then march'd off. This city has also been several times destroyed by fire, viz. in 1190, on June 3. in 1195, and 1877; after which it is said to have continued desolate till 1223, when it was repaired, ditched, and walled round. In the Saxa heptarchy there were three mints in Rochester, two for the king and one for the bishop. In 1281, its old wooden bridge was carried off by the ice, in a sudden thaw after a frost which had made the Medway passable on foot. Another was built in the reign of Richard II. but pulled down again, on the rumour of an invasion from France. It was afterwards reformed, but so often subject to expensive repairs, by reason of the rapid course of the river under it, as well as the great breadth and depth of it, that in the reign of Edward III. it was resolved to build a new bridge of stone; and the same was begun, and in a manner completed, at the expence of Sir John Cobham and Sir Robert Knolles, Edward III's generals, out of the spoils they had taken in France. It has 21 arches. The town is governed by a mayor, recorder, 12 aldermen, 12

common-councilmen, a town-clerk, three sergeants at mace, and a water-bailiff. To its cathedral belong a dean and six prebendaries. Gundulph's tower stands on the north side of the cathedral, and is supposed to have been built by the bishop, as a place of security for the treasures and archives of that church and see. Some suppose it to have been intended for a bell-tower, and others for an ecclesiastical prison; but whatever might be its destination, its machicolations, its loop-hole windows, and the thickness of its walls, show strength and defence were considered as necessary. This tower was 50 feet high, but some part has lately fallen down; the walls are six feet thick, and contain within them an area of 20 feet square; it was divided into five stories or stories of unequal height, and had a communication with the upper part of the church, by means of an arch or bridge, the steps of which are still visible. It is supposed to have been erected after the cathedral was built. For the maintenance of its bridge, certain lands are tied down by parliament, to which it has ten members from the first. The town-house, built in the year 1687, for the courts, assizes, and sessions, and the charity-school, are two of the best public buildings here.—A mathematical school was founded here, and an alms-house for lodging six poor travellers every night, and allowing them 4d. in the morning when they depart, except persons contagiously diseased, rogues, and proctors. In the summer here are always six or eight lodgers, who are admitted by tickets from the mayor. The Roman Watling-street runs through this town from Shooters-hill to Dover. The mayor and citizens hold what is called an admiralty-court once a-year for regulating the oyster-fishery in the creeks and branches of the Medway that are within their jurisdiction, and for prosecuting the cable-hangers, as they are called, who dredge and fish for oysters without being free, by having served seven years apprenticeship to a fisherman who is free of the fishery. Every licensed dredger pays 6s. 8d. a-year to the support of the courts, and the fishery is now in a flourishing way. Part of the castle is kept in repair, and is used as a magazine, where a party of soldiers do constant duty. The bridge was repaired in 1744, and pallisadoed with new iron rails. Rochester contains about 700 houses, and 2000 inhabitants. It consists of only one principal street, which is wide, and paved with flints. The houses are generally well built with brick, and inhabited by tradesmen and inn-keepers. It has also four narrow streets; but no sort of manufactory is carried on here. Stroud is at the west end of this place, and Chatham at the east. It is 27 miles north-west by west of Canterbury, and 30 south-east by east of London. Long. 0. 36. E. Lat. 51. 25. N.

**ROCHESTER** (earl of.) See WILMOT.

**ROCK**, a large mass or block of hard stone rooted in the ground. See MOUNTAIN, PETRIFICATION, and STONE.

**ROCK**, in ornithology, a species of VULTURE.

**Rock-Basins** are cavities or artificial basins of different sizes, from six feet to a few inches diameter, cut in the surface of the rocks for the purpose, as is supposed, of collecting the dew and rain pure as it descended from the heavens, for the use of ablutions and purifications, prescribed in the druidical religion; these, especially the dew, being deemed the purest of all fluids.

Rock,  
Rocket.

**fluids.** There are two sorts of these basons, one with lips or communications between the different basons, the other simple cavities. The lips as low as the bottom of the basons, which are horizontal, and communicate with one somewhat lower, so contrived that the contents fall by a gradual descent through a succession of basons either to the ground, or into a vessel set to receive it. The basons without lips might be intended for reservoirs to preserve the rain or dew in its original purity without touching any other vessel, and was perhaps used for the druid to drink, or wash his hands, previous to officiating at any high ceremony, or else to mix with their mistletoe.

Some of these basons are so formed as to receive the head and part of the human body; one of this kind is found on a rock called King Arthur's bed, in the parish of North Hall in Cornwall, where are also others, called by the country people Arthur's troughs, in which they say he used to feed his dogs.

**Rock-Crystal,** in natural history, otherwise called *spring crystal*, a name given to the third order of crystals, from their being affixed to a rock or other solid body. See CRYSTAL.

**Rock-Salt.** See SALT.

**Rock-Oil.** See PETROLEUM.

**Rock-Fish.** See COBIUS.

**ROCKET**, an artificial fire-work, consisting of a cylindrical case of paper, filled with a composition of certain combustible ingredients; which, being tied to a stick, mounts into the air, and then bursts. See PYROTECHNY.

*Theory of the Flight of Sky-ROCKETS.* Mariotte takes the rise of rockets to be owing to the impulse or resistance of the air against the flame. Dr Desaguliers accounts for it otherwise.

Conceive the rocket to have no vent at the choak, and to be set on fire in the conical bore; the consequence will be, either that the rocket would hurt in the weakest place, or, if all its parts were equally strong, and able to sustain the impulse of the flame, the rocket would burn out immovable. Now, as the force of the flame is equable, suppose its action downwards, or that upwards, sufficient to lift 40 pounds. As these forces are equal, but their directions contrary, they will destroy each other's action.

Imagine then the rocket opened at the choak; by this means the action of the flame downwards is taken away, and there remains a force equal to forty pounds acting upwards, to carry up the rocket, and the stick it is tied to. Accordingly, we find that if the composition of the rocket be very weak, so as not to give an impulse greater than the weight of the rocket and stick, it does not rise at all; or if the composition be slow, so that a small part of it only kindles at first, the rocket will not rise.

The stick serves to keep it perpendicular; for if the rocket should begin to stumble, moving round a point in the choak, as being the common centre of gravity of rocket and stick, there would be so much friction against the air by the stick between the centre and the point, and the point would beat against the air with so much velocity, that the friction of the medium would restore it to its perpendicularity.

When the composition is burnt out, and the impulse upwards is ceased, the common centre of gravity is

brought lower towards the middle of the stick; by which means the velocity of the point of the stick is decreased, and that of the point of the rocket increased; so that the whole will tumble down, with the rocket-end foremost.

All the while the rocket burns, the common centre of gravity is shifting and getting downwards, and still the faster and the lower as the stick is the lighter, so that it sometimes begins to tumble before it be burnt out; but when the stick is a little too heavy, the weight of the rocket bearing a less proportion to that of the stick, the common centre of gravity will not get so low but that the rocket will rise straight, though not so fast.

**ROCKET**, in botany. See BRASSICA.

**ROCKINGHAM**, a town in Northamptonshire, in England, 44 miles from London, stands on the river Welland. It has a charity school, a market on Thursday, and a fair on Sept. 8. for five days. Its forest was reckoned one of the largest and richest of the kingdom, in which William the Conqueror built a castle: it extended, in the time of the ancient Britons, almost from the Welland to the Nen, and was noted formerly for iron-works, great quantities of flax &c. the refuse of the iron ore, being met with in the adjacent fields. It extended, according to a survey in 1641, near 14 miles in length, from the west end of Middleton Woods to the town of Middleton, and five miles in breadth, from Brightock to the Welland, but is now dismembered into parcels, by the interposition of fields and towns, and is divided into three hamlets. In several of its woods a great quantity of charcoal is made of the tops of trees, of which many waggons loads are sent every year to Peterborough. There is a spacious plain in it called Rockinghamshire, which is a common to the four towns of Corringham, Rockingham, Corby, and Geddington. King William Rufus called the council here of the great men of the kingdom. W. Long. O. 46. N. Lat. 52. 32.

**ROCKING-STONES.** See *Rocking Stones*.

**ROCKOMBOLE.** See ALLIUM.

**ROD**, a land measure of 16 feet and a half; the same with perch and pole.

**Black Rod.** See *Officers of the Black Rod*.

**Fishing Rod,** a long taper rod or wand, to which the line is fastened for angling. See *Fishing Rod*.

**RODNEY** (George Bridges), Lord Rodney, was born in the year 1718. Of the place of his birth and the rank of his ancestors we have not been able to procure any well authenticated account. His father was a naval officer; and commanding, at the time of his son's birth, the yacht in which the king, attended by the duke of Chandos, was passing to or from Hanover, he asked and obtained leave to have the honour of calling his infant son *George Bridges*. The royal and noble godfathers advised Captain Rodney to educate his boy for his own profession, promising, as we have been told, to promote him as rapidly as the merit he should display and the regulations of the navy would permit.

Of young Rodney's early exertions in the service of his country, nothing, however, is known to the writer of this abstract, nor, indeed, any thing of sufficient importance to be inserted in articles so circumscribed as all our biographical sketches must be, till 1751, when we find him, in the rank of a commodore, sent out to make

Rocket  
Rodney.

**Rodney.** make accurate discoveries respecting an island which was supposed to lie about 50° N. Lat. and about 300 leagues W. of England; but he returned without having seen any such island as that which he was appointed to survey. In the war which soon followed this voyage of discovery, he was promoted to the rank of a rear-admiral, and was employed to bombard Havre-de-Grace; which in 1759 and 1760 he considerably damaged, together with some shipping. In 1761 he was sent on an expedition against Martinico, which was reduced in the beginning of the year 1762, and about the same time St Lucia surrendered to Captain Harvev. Both these islands were restored to the French at the peace of 1763.

In reward for his services, he was created a knight of the Bath; but being inattentive, as many seamen are, to the rules of economy, his circumstances became so embarrassed that he was obliged to fly from his country, with very slight hopes of ever being able to return. He was in France when the ill-advised policy of that court made them take a decided part with America against Great Britain; and it is said that some men in power, no strangers to the desperate fate of Sir George's affairs, offered him a high command in the French navy, if he would carry arms against his own country. This offer he rejected with becoming indignation. Soon after this gallant behaviour, the Duke de Chartres, afterwards the infamous Orleans, told Sir George that he was to have a command in the fleet which was to be opposed to that under the command of his countryman Mr. Keppel; and with an insulting air asked him what he thought would be the consequence of their meeting? "That my countryman will carry your highness with him to Spain, England," was the high-spirited reply.—When the division, which the mutual recriminations of Admiral Keppel and Sir Hugh Palliser excited in the British navy, made it difficult for the ministry to procure experienced, and at the same time popular, commanders for their fleets, Lord Sandwich wrote to Sir George Bridges Rodney, offering him a principal command; but the difficulty was for the veteran to find money to pay his accounts in France, so that he might be permitted to leave that kingdom. The money, it has been repeatedly affirmed, advanced to him by the courtiers whose offer he had before indignantly rejected. He arrived, therefore, in England, and was again employed in the service of his country. His first exploit after his appointment was in January 1780, when he took 19 Spanish transports bound to Cadiz from Bilbao, together with a 64-gun ship and 5 frigates, their convoy. On the 16th of the same month he fell in with the Spanish fleet, consisting of 11 sail of the line, under the command of Don Juan de Langara; of which one was blown up during the engagement, five were taken and carried into Gibraltar, among which was the admiral's ship, and the rest were much shattered. In April the same year, he fell in with the French fleet, under the command of Admiral Guichen, at Martinico, whom he obliged to fight, and whom he completely beat; tho' from the shattered state of his own fleet, and the unwillingness of the enemy to risk another action, he took none of their ships. The successful efforts of our gallant admiral during the year 1780 were generally applauded through the nation. He received the thanks of both houses of parliament, and addresses of thanks from va-

rious parts of Great Britain, and the islands to which his victories were more particularly serviceable. In December the same year, he made an attempt, together with General Vaughan, on St. Vincent's, but failed. In 1781, he continued his exertions, with much success, in defending the West India islands; and along with the above-named general, he conquered St. Eustatius, on which occasion his conduct to the inhabitants has been much, though perhaps unjustly, censured. The island was certainly a nest of contraband traders.

On the 14th of April 1782, he came to a close action with the French fleet under Count de Grasse; during which he sunk one ship and took five, of which the admiral's ship, the *Ville de Paris*, was one. The following year brought peace; but, as a reward for his numerous services, he had a grant of 2000*l.* a-year for himself and his two successors. He had long before been created a baronet, was rear-admiral of Great Britain, and at length was justly promoted to the peerage, by the title of Baron Rodney of Stoke, Somersetshire, and made vice-admiral of Great Britain. He was once also governor of Greenwich hospital.

Lord Rodney had been twice married; first to the sister of the earl of Northampton, and secondly to the daughter of John Clies, Esq; with whom he did not reside for several years before his death, which happened on the 24th of May 1792. He was succeeded in title and estates by his son George, who married in 1781 Martha, daughter of the right hon. Alderman Harley, by whom he has issue.

Of the private life of Lord Rodney we know but little. His attention to the wants of the seamen, and the warrant officers serving under him, indicated that humanity which is always allied to true courage. He has often, from the number of dishes which his rank brought to his table, selected something very plain for himself, and sent the rest to the midshipmen's mess.—His public transactions will transmit his name with honour to posterity; his bravery was unquestionable, and his success has been seldom equalled. It has, indeed, been very generally said, that his skill in naval tactics was not great, and that he was indebted to the superior abilities of Captain Young and Sir Charles Douglas for the manœuvres by which he was so successful against Langara and De Grasse. But, supposing this to be true, it detracts not from his merit. A weak or foolish commander could not always make choice of the ablest officers for his first captains, nor would such a man be guided by their advice.

Whatever was Lord Rodney's skill in the science of naval war, or however much he may have been beholden to the counsels of others, he certainly possessed himself the distinguished merit of indefatigable exertion; for he never omitted any thing within the compass of his power to bring the enemy to action. He therefore unquestionably deserves the respect and the gratitude of his country. In the year 1783 the house of assembly in Jamaica voted 1000*l.* towards erecting a marble statue to him, as a mark of their gratitude and veneration for his gallant services, so timely and gloriously performed for the salvation of that island in particular, as well as the whole of the British West India islands and trade in general. We have not, however, heard of any such tribute being paid to him in Britain either before or since his death.

**Rodney.**

Roe  
Rohan.

**ROE**, the seed or spawn of fish. That of the male fish is usually distinguished by the name of *soft roe*, or *milt*; and that of the female, *hard roe*, or *spawn*. So inconceivably numerous are these ovula or small eggs, that M. Petit found 342,144 of them in a carp of 18 inches; but M. Leeuwenhoek found in a carp no more than 211,689. This last gentleman observes, that there are four times this number in a cod; and that a common one contains 9,344,000 eggs.

**ROX**, in zoology. See *Cervus*.

**ROELLA**, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 9th order, *Campanacea*. The corolla is funnel-shaped, with its bottom shut up by stamiferous valves; the stigma is bifid; the capsule bilocular, and cylindrical inferior.

**ROGA**, in antiquity, a present which the emperors made to the senators, magistrates, and even to the people; and the popes and patriarchs to their clergy. These rogæ were distributed by the emperors on the first day of the year, on their birth-day, or on the *natalis dies* of the cities; and by the popes and patriarchs in passion week. Roga is also used for the common pay of the soldiers.

**ROGATION (ROGATIO)**, in the Roman jurisprudence, a demand made by the consuls or tribunes of the Roman people, when a law was proposed to be passed. *Rogatio* is also used for the decree itself made in consequence of the people's giving their assent to this demand; to distinguish it from a *senatus consultum*, or decree of the senate.

**ROGATION-Week**, the week immediately succeeding Whit Sunday; so called from the three feasts therein, viz. on Monday, Tuesday, and Wednesday.

**ROGER DE HOVEDEN**, a learned man of the 13th century, was born in Yorkshire, most probably at the town of that name, now called *Howden*, some time in the reign of Henry I. After he had received the first parts of education in his native country, he studied the civil and canon law, which were then become the most fashionable and lucrative branches of learning. He became domestic chaplain to Henry II. who employed him to transact several ecclesiastical affairs; in which he acquitted himself with honour. But his most meritorious work was, his *Annals of England*, from A. D. 731, when Bede's Ecclesiastical History ends, to A. D. 1202. This work, which is one of the most voluminous of our ancient histories, is more valuable for the sincerity with which it is written, and the great variety of facts which it contains, than for the beauty of its style, or the regularity of its arrangement.

**ROGUE**, in law, an idle sturdy beggar; who by ancient statutes is for the first offence called a *rogue* of the first degree, and punished by whipping, and boring through the gristle of the right ear with a hot iron; and for the second offence, is termed a *rogue* of the second degree, and, if above 18 years of age, ordered to be executed as a felon.

**ROHAN (Peter de)**, Chevalier de Gié, and marshal of France, better known by the name of *Marshal de Gié*, was the son of Louis de Rohan, the first of the name, lord of Guéméné and Montauban, and descended of one of the most ancient and most illustrious families of the kingdom. The family of Rohan, before the Revolution, held the rank of prince in France

Rohan.

in consequence of deriving its origin from the first sovereigns of Brittany, and clearly admitted by the dukes of Brittany themselves in the states general of that province held in 1088. The house of Rohan had still another advantage, which was common to it with very few families, even the most distinguished among the princes, namely, that instead of having been aggrandized by the wealth procured from alliances, it had held in itself for seven centuries the largest possessions of any family in the kingdom.

One of the most distinguished branches of this family was Peter, the subject of the present article. Louis XI. rewarded his bravery with the staff of marshal of France in 1475. He was one of the four lords who governed the kingdom during the indisposition of that prince at Chinon in 1484. Two years afterwards he opposed the attacks of the archduke of Austria upon Picardy. He commanded the van-guard at the battle of Fornoue in 1495, and signalized himself much in that engagement. His bravery procured him the countenance and confidence of Louis XII. who appointed him his prime counsellor, and general of the army in Italy; but these advantages he lost, by incurring the displeasure of Anne of Brittany the queen.

The marshal had stopped some of her equipage on the road to Nantes, for which that vindictive princess prevailed on her husband to enter into a process against him before the parliament of Toulouse, at that time the most rigorous and severe in the kingdom. He was on the 17th of February 1500 found guilty, banished from the court, and deprived of the privileges and emoluments of his office for life. The expense of this prosecution amounted to more than 31,000 livres, and it did no honour either to the king or the queen. If indeed it be true, that the queen was never so much delighted as with the humiliation of her enemies, she had good reason to be satisfied here. John de Audoubert, who has entered into a pretty full detail of this affair, reports that Gié, being removed to the *Chateau de Dreux*, became an object of ridicule to the witnesses who had sworn against him. He wore a long white beard, and, quite full of the thoughts of his disgrace, took it on one occasion in his hands and covered his face with it. An ape, belonging to Alain d'Albert, count of Dreux, jumped from a bed where his master was reposing himself, and attacked the beard of Gié, who, with some difficulty, extricated himself. This scene not only occasioned much laughter to the whole company who were present, but likewise became instantly the subject of the farces and mummeries which were then acting in France. Even the school-boys made a representation of it, where, alluding to the name of the queen, they said, that there was a marshal who wished to *fox* an ass (*un âne*), but that he received such a blow with the foot, as threw him over the wall into the garden. Marechal de Gié died at Paris, the 22d April 1513, perfectly disgusted with courts and grandeur.

**ROHAN (Henry duke of)**, peer of France, and prince of Leon, was born at the Chateau de Blein in Brittany in 1579. Henry IV. under whose eyes he gave distinguished proofs of his bravery at the siege of Amiens, when only 16 years of age, loved him with as much affection as if he had been his own son. After the death of Henry, he became chief of the Calvinists

**Rohan.** in France; and was equally formidable for his genius as his sword. In defence of the civil and religious rights of his party, he maintained three wars against Louis XIII. The first, which terminated to the advantage of the Protestants, broke out when that prince wished to establish the Romish religion in Bearn: the second, because of the siege which Cardinal de Richlieu caused to be laid to Rochelle: and the third, when that place was besieged a second time. The consequences of this war are sufficiently known: Rochelle surrendered: and the duke de Rohan perceiving, that after the taking of this place, the majority of his party were endeavouring to make up matters with the court, succeeded in procuring for them a general peace in 1629, upon very honourable and advantageous terms. The only sacrifice of importance which the Huguenots were obliged to make, was their fortifications: which put it out of their power to renew the war. Some faction persons, dissatisfied with seeing their fortresses fall into their enemies hands, were ready to accuse their general of having sold them. This great man, undeterred by such odious ingratitude, presented his breast to these enraged malcontents, and said, "Strike, strike! I wish to die by your hands, after I have hazarded my life in your service." The peace of 1629 having extinguished the flame of civil war, the duke de Rohan, no longer of use to his party, and become disagreeable at court, retired to Venice. There is a very particular anecdote of him, extracted from the Memoirs of the duchess of Rohan, Margaret of Bethune, daughter of the famous Sully. Whilst the duke de Rohan was at Venice, a proposal was made to him from the Porte, that for 300,000 crowns, and an annual tribute of 20,000, the Grand Signior would give him the island of Cyprus, and invest him with the dignity and prerogatives of king. The duke was warmly inclined to comply with this proposal, and to settle in the island the Protestant families of France and Germany. He negotiated this business at the Porte by means of the intervention of the patriarch Cyril, with whom he had much correspondence; but different circumstances, and in particular the death of the patriarch, occurred to break off the treaty. The republic of Venice chose Rohan for their commander in chief against the Imperialists; but Louis XIII. took him from the Venetians, and sent him ambassador into Switzerland, and into the Grisons. He wished to assist these people in bringing back the Valteline under their obedience, the revolt of which the Spaniards and Imperialists encouraged. Rohan, being declared general of the Grisons, after many victories, drove the German and Spanish troops entirely from the Valteline in 1633. He defeated the Spaniards again in 1636 at the banks of the lake of Côme. France, not thinking it proper to withdraw her troops, the Grisons rose up in arms, and the duke de Rohan, not satisfied with the conduct of the court, entered into a special treaty with them the 28th March 1637. This hero, fearing the resentment of Cardinal de Richlieu, retired to Geneva, with a view to join his friend the duke of Saxe-Weimar, who wished him to undertake the command of his army, then ready to engage the Imperialists near Rhinfield. Although he declined this honour, yet he took the command of the regiment of Nassau, with which he threw the enemy into confusion; but was himself wounded, February 28. 1683.

and died of his wounds the 13th of April following, at the age of 59. He was interred May 27. in the church of St Pierre in Geneva, where there is a magnificent monument of marble erected to his memory, having on it the most illustrious actions of his life. The duke de Rohan was one of the greatest generals of his time, equal to the princes of Orange, and capable, like them, of settling a commonwealth; but more zealous than they for religion, or at least appearing to be so. He was vigilant and indefatigable, not allowing himself any pleasures which might take off his attention from his necessary employments, and well qualified for being the head of a party; a post very difficult to retain, and in which he had to fear equally from his enemies and his friends. It is in this light that Voltaire has viewed this illustrious character, when he composed the following verse:

*Avec tous les talens le Ciel l'avoit fait naître :*

*Il agit en Heros ; en Sage il écrivit.*

*Il fut même grand homme en combattant son Maître,  
Et plus grand lorsqu'il le servoit.*

His military virtues were much heightened by the sweetness of his disposition, his affable and courteous manners, and by a generosity which had few examples. Neither ambition, pride, nor a view of gain, could ever be traced in his character. He was wont to say, that "true glory and a zeal for the public good never dwelt where self-interest reigned." Rohan had always a particular regard for Henry the Fourth: "Truly (said he, sometimes after the death of that prince) when I think of him, my heart is ready to break. A wound received in his presence would have afforded me more satisfaction than now to gain a battle. I would have valued an encomium from him in this art, of which he was the greatest master of his time, more than the united praises of all the commanders now living." He wrote several interesting performances: 1. The Interest of Princes, printed at Cologne in 1666, in 12mo: in which work he fully examines the public interests of all the princes of Europe. 2. The Perfect General, or an abridgement of the wars from Caesar's Commentaries, in 12mo. In this he makes it appear, that a knowledge of the tactics of the ancients might be of much use to the moderns. 3. A Treatise on the Corruption of the ancient Militia. 4. A Treatise on the Government of the Thirteen Provinces. 5. Memoirs; the best edition of which is in 2 vols. 12mo. They contain the history of France from 1610 to 1629. 6. A Collection of some Political Discourses on State Affairs, from 1612 to 1629, 8vo, Paris, 1644, 1693, 1755; with the Memoirs and Letters of Henry Duke de Rohan relative to the war of the Valteline, 3 vols. 12mo, Geneva, 1757. This was the first edition which appeared of these curious memoirs: We owe it to the great attention and diligence of M. le Baron de Zurlauben, who published them from different authentic manuscripts. He likewise ornamented this edition with geographical, historical, and genealogical notes, and a preface, which contains an abridged, but highly interesting life, of the duke de Rohan, author of the memoirs. The abbé Perau has also written a life of him, which occupies the 21st and 22d volumes of the History of the Illustrious Men of France. Some want of spirit might be excused in the detail of wars finished upwards of 140 years

**Rohan.**

Rohault  
Roll.

years ago; yet the memoirs of the duke de Rohan still afford considerable pleasure in the perusal. He tells his story with humour, with sufficient exactness, and in such a style as procures the confidence of the reader.

**ROHAULT** (James), a celebrated Cartesian philosopher, was the son of a merchant of Amiens, where he was born in 1620. He became well skilled in the mathematics, and taught them at Paris, where he became acquainted with M. Clerelier, an advocate, who gave him his daughter in marriage. Rohault also taught philosophy in the same city with uncommon applause. He there improved the arts, and gave excellent lectures to the artists and workmen. He died at Paris in 1675. He wrote, in French, 1. A Treatise on Natural Philosophy. 2. The Elements of the Mathematics. 3. A Treatise on Mechanics, which is very curious. 4. Philosophical Conversations; and other works. His Physics have been translated into Latin, by Dr Samuel Clarke, with notes, in which the Cartesian errors are corrected upon the Newtonian system.

**ROLANDRA**, in botany: A genus of the polygamia segregata order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The common calyx consists of distinct *foveoli*, between each of which are short *squame*, the whole forming a round head. The partial calyx is bivalved. The corolla is small and funnel-shaped, the tube small as a thread, the *lacinae* short and acute. The stamina are five; the style bifid. It has no other seed vessel except the partial calyx, which contains a long three-sided seed. Of this there is only one species, viz. the *argentea*; a native of the West Indies, and found in copes and waste lands.

**ROLL**, in manufactories, something wound and folded up in a cylindrical form.

Few stuffs are made up in rolls, except satins, gauzes, and crapes; which are apt to break, and take plaits not easy to be got out, if folded otherwise. Ribbons, laces, galloons, and paduas of all kinds, are also thus rolled.

A roll of tobacco, is tobacco in the leaf, twisted on the mill, and wound twist over twist about a stick or roller. A great deal of tobacco is sold in America in rolls of various weights; and it is not till its arrival in England, Spain, France, and Holland, that it is cut.

A roll of parchment, properly denotes the quantity of 60 skins.

The ancients made all their books up in the form of rolls; and in Cicero's time the libraries consisted wholly of such rolls.

**ROLL**, in law, signifies a schedule or parchment which may be rolled up by the hand into the form of a pipe.

In these schedules of parchment, all the pleadings, memorials, and acts of court, are entered and filed by the proper officer; which being done, they become records of the court. Of these there are in the exchequer several kinds, as the great wardrobe roll, the cofferer's roll, the subsidy roll, &c.

Roll is also used for a list of the names of persons of the same condition, or of those who have entered into the same engagement. Thus a court-roll of a manor, is that in which the names, rents, and services, of each tenant are copied and enrolled.

**Gulver-head ROLL**, a roll in the two temples, in which every bench is taxed yearly at 2s. every barrister at 1s. 6d. and every gentleman under the bar at 1s. to the cook and other officers of the house, in consideration of a dinner of calves heads provided in Easter-term.

**Myfter-Roll**, that in which are entered the soldiers of every troop, company, regiment, &c. As soon as a soldier's name is written down on the roll, it is death for him to desert.

**Rolls-Office**, is an office in Chancery-lane, London, appointed for the custody of the rolls and records in chancery.

**Master of the Rolls**. See *MASTER of the Rolls*.

**Rider-Roll**, a schedule of parchment frequently sewed or added to some part of a roll or record.

**Rolls of Parliament**, are the manuscript registers or rolls of the proceedings of our ancient parliaments, which before the invention of printing were all engrossed on parchment, and proclaimed openly in every county. In these rolls are also contained a great many decisions of difficult points of law which were frequently in former times referred to the decision of that high court.

**ROLL**, or *Roller*, is also a piece of wood, iron, brass, &c. of a cylindrical form, used in the construction of several machines, and in several works and manufactures.

Thus in the glass manufacture they have a running roll, which is a thick cylinder of cast brass, which serves to conduct the melted glass to the end of the table on which large looking-glasses, &c. are cast.

Founders also use a roll to work the sand which they use in making their moulds.

The presses called *calendans*, as serving to calendar stuffs withal, consist, among other essential parts, of two rollers. It is also between the two rollers that the waves are given to silks, mohairs, and other stuffs proper to be tabbied.

Impressions from copperplates are also taken by passing the plate and paper between two rollers. See *Rolling-press* **PRINTING**.

Rolls, in flattening-mills, &c. are two iron instruments of a cylindrical form, which serve to draw or stretch out plates of gold, silver, and other metals.

Rolls, in sugar-works, are two large iron barrels which serve to bruise the canes, and to express the juice. These are cast hollow, and their cavities are filled up with wood, the cylinders of which are properly the rollers.

**ROLLER**, in surgery, a long and broad bandage, usually of linen-cloth, rolled round any part of the body, to keep it in, or dispose it to a state of health.

**ROLLI** (Paul), was born at Rome in 1687. He was the son of an architect, and the pupil of the celebrated Gravina, who inspired him with a taste for learning and poetry. An intelligent and learned English lord having brought him to London, introduced him to the royal family as a master of the Tuscan language. Rolli remained in England till the death of Queen Caroline his protector, and the patroness of literature in general. He returned to Italy in 1747, where he died in 1767, in the 80th year of his age, leaving behind him a very curious collection in natural history, &c. and a valuable and well chosen library. His principal works first appeared

Roll.  
Rolli.

Rollin.

peared in London in 1735, in 8vo. They consist of odes in blank verse, elegies, songs, and other things, after the manner of Catullus. There is likewise, by him, a Collection of Epigrams, printed at Florence in 1776, in 8vo, and preceded with his life by the abbé Foedini. What Martial said of his own Collection may be said of this, "That there are a few good, but many indifferent or bad, pieces in it." Rollin, however, bore the character of one of the best Italian poets of his age. During his stay in London, he produced editions of several authors of his own country. The principal of these were, the Satires of Ariosto, the Burlesque Works of Berni, Varchi, &c. 2 vols, in 8vo, which possess considerable merit. The Decameron of Boccace, 1727, in 4to and folio; in which he has faithfully copied the celebrated and valuable edition published by the *Juntas* in 1527; and, lastly, of the elegant *Lucretia* of Marchetti, which, after the manuscript was revised, was printed at London in 1717, in 8vo, through the influence and attention of Rollin. This edition is beautiful; but the work is thought of pernicious tendency. There are likewise, by him, translations into Italian verse of the *Paradise Lost* of Milton, printed at London in folio in 1735; and of the *Odes of Anacreon*, London 1730, in 8vo.

ROLLIN (Charles), a justly celebrated French writer, was the son of a cutler at Paris, and was born there on the 30th of January 1661. He studied at the college Du Pleffin, in which he obtained a bursary through the interest of a Benedictine monk of the White Mantle, whom he had served at table, and who discovered in him some marks of genius. Here he acquired the regard of M. Gobinet, principal of that college, who had a particular esteem for him. After having studied metaphysics and philosophy at the college of Du Pleffin, he applied to divinity three years at the bishopric, but he did not prosecute this study, and never rose in the church higher than to the rank of a tonsured priest. He afterwards became professor of rhetoric in the same college; and, in 1688, succeeded Florian, his master, as professor of eloquence, in the royal college. No man ever exercised the functions of it with greater eclat: he often made Latin orations, to celebrate the memorable events of the times; and frequently accompanied them with poems, which were read and esteemed by every body. In 1694, he was chosen rector of the university; and continued in that office two years, which was then a great mark of distinction. By virtue of his office, he spoke the annual panegyric upon Louis XIV. He made many very useful regulations in the university; and particularly revived the study of the Greek language, which was then much neglected. He substituted academical exercises in the place of tragedies; and introduced the practice which had been formerly observed, of causing the students to get by heart passages of Scripture. He was a man of indefatigable attention; and trained innumerable persons, who did honour to the church, the state, and the army. The first president Portail was pleased one day to reproach Rollin in a jocular strain, as if he exceeded even himself in doing business: to whom Rollin replied, with that plainness and sincerity which was natural to him, "It becomes you well, Sir, to reproach me with this; it is this habit of labour in me which has distinguished you in the place of

Vol. XVI. Part I.

advocate-general, which has raised you to that of first president: you owe the greatness of your fortune to me."

Upon the expiration of the rectorship, Cardinal Noailles engaged him to superintend the studies of his nephews, who were in the college of Laon; and in this office he was agreeably employed, when, in 1699, he was with great reluctance made coadjutor to the principal of the college of Beauvais. This college was then a kind of desert, inhabited by very few students, and without any manner of discipline: but Rollin's great reputation and industry soon re-peopled it, and made it that flourishing society it has ever since continued. In this situation he continued till 1712; when the war between the Jesuits and the Jansenists drawing towards a crisis, he fell a sacrifice to the prevalence of the former. Father le Tellier, the king's confessor, a furious agent of the Jesuits, infused into his master prejudices against Rollin, whose connections with Cardinal de Noailles would alone have sufficed to have made him a Jansenist; and on this account he lost his share in the principality of Beauvais. No man, however, could have lost less in this than Rollin, who had every thing left him that was necessary to make him happy: retirement, books, and enough to live on. He now began to be employed upon Quintilian; an author he justly valued, and saw neglected not without uneasiness. He retrenched in him whatever he thought rather curious than useful for the instruction of youth; he placed summaries or contents at the head of each chapter; and he accompanied the text with short select notes. His edition appeared in 1715, in 2 vols. 12mo, with an elegant preface, setting forth his method and views.

In 1710, the university of Paris, willing to have a head suitable to the importance of their interests in the then critical conjuncture of affairs, chose Rollin again rector: but he was displaced in about two months by a lettre de cachet. The university had presented to the parliament a petition, in which it protested against taking any part in the adjustment of the late disputes; and their being congratulated in a public oration by Rollin on this step, occasioned the letter which ordered them to choose a rector of more moderation. Whatever the university might suffer by the removal of Rollin, the public was probably a gainer; for he now applied himself to compose his treatise upon the Manner of Studying and Teaching the Belles Lettres, which was published, two volumes in 1726, and two more in 1728, 8vo.

This work has been justly esteemed for the sentiments of religion which animate its author, whose zeal for the public good prompted him to select the choicest passages of Greek and Latin authors. The style is sufficiently elegant, but the language on some occasions is not remarkable for delicacy; and in the book altogether there is neither much order nor depth. The author has indeed spoken of common things agreeably, and has spoken as an orator on subjects which demanded the investigation of the philosopher. One can scarcely reduce anything in him to principles.—For example, the three species of eloquence; the simple, the temperate, and the sublime, can scarcely be understood from him when we read that the one resembles a frugal table; the second a beautiful ruin, with green wood growing

Rollin. on its banks; and the third thunder and an impetuous river which overthrows every thing that opposes it.

The work, however, has been exceedingly successful, and justly so; and its success encouraged its author to undertake another work of equal use and entertainment; his *Histoire Ancienne*, &c. or "Ancient History of the Egyptians, Carthaginians, Assyrians, Babylonians, Medes and Persians, Macedonians, and Greeks," which he finished in 13 vols. 8vo. and published between 1730 and 1738. M. Voltaire, after having observed that Rollin was "the first member of the university of Paris who wrote French with dignity and correctness," says of this work, that "though the last volumes, which were written in too great a hurry, are not equal to the first, it is nevertheless the best compilation that has yet appeared in any language; because it is seldom that compilers are eloquent, and Rollin was remarkably so." This is perhaps saying too much. There are indeed in this work some passages very well handled; but they are only such as he had taken from the ancient authors, in doing justice to whom he was always very happy. The reader will easily discover in this work the same attachment to religion, the same desire for the public good, and the same love of virtue, which appears in that on the Belles Lettres. But it is to be lamented that his chronology is neither exact nor corresponding; that he states facts inaccurately; that he has not sufficiently examined the exaggerations of ancient historians; that he often interrupts the most solemn narrations with mere trifles; that his style is not uniform; and this want of uniformity arises from his borrowing from writers of a modern date 40 or 50 pages at a time. Nothing can be more noble and more refined than his reflections; but they are shrewd with too sparing a hand, and want that lively and laconic turn on account of which the historians of antiquity are read with so much pleasure. He transgresses the rule which he himself had established in his Treatise on Studies. "The precepts which have a respect to manners (says he) ought, in order to make an impression, to be short and lively, and pointed like a dart. That is the most certain method of making them enter and remain on the mind." There is a visible negligence in his diction with regard to grammatical custom, and the choice of his expressions, which he does not choose at all times with sufficient taste, although, on the whole, he writes well, and has preserved himself free from many of the faults of modern authors. While the last volumes of his Ancient History were printing, he published the first of his Roman History; which he lived to carry on, through the eighth and into part of the ninth, to the war against the Cimbri, about 70 years before the battle of Actium. Mr Crevier, the worthy disciple of Rollin, continued the history to the battle of Actium, which closes the tenth volume; and has since completed the original plan of Rollin in 16 vols. 12mo, which was to bring it down from the foundation of the city to the reign of Constantine the Great. This history had not so great success as his Ancient History had. Indeed it is rather a moral and historical discourse than a formal history; for the author does little more than point out some more remarkable events, while he dwells with a sort of prolixity on those parts which furnish him a free field for moralizing. It is alternately diffuse and barren; and the greatest advantage of the work is, that there are several passages from T.

Livy translated with great elegance into French. He also published A Latin Translation of most of the Theological Writings relative to the disputes of the Times in which he lived. Rollin was one of the most zealous adherents of Deacon Paris; and before the enclosure of the cemetery of St Medard, this distinguished character might have been often seen praying at the foot of his tomb. This he confesses in his Lettres. He published also Lesser Pieces; containing different Letters, Latin Harangues, Discourses, Complimentary Addresses, &c. Paris 1771, 2 vols. 12mo. A collection which might have been contained in one volume, by keeping in only the best pieces. It is notwithstanding valuable for some good pieces which it contains, for the favourable opinion which it exhibits of solid probity, sound reason, and the zeal of the author for the progress of virtue and the preservation of taste. The Latin of Rollin is very correct, and much after the Ciceronian style, and embellished with most judicious thoughts and agreeable images. Full of the reading of the ancients, from which he brought quotations with as much propriety as plenty, he expressed himself with much spirit and excellence. His Latin poems deserve the same eulogium.

This excellent person died in 1741. He had been named by the king a member of the academy of inscriptions and belles lettres in 1701: but as he had not then brought the college of Beauvais into repute, and found he had more business upon his hands than was consistent with a decent attendance upon the functions of an academician, he begged the privileges of a veteran, which were honourably granted him. Nevertheless, he maintained his connexion with the academy, attended their assemblies as often as he could, laid the plan of his ancient history before them, and demanded an academician for his censor. Rollin was a man of an admirable composition; very ingenious, consummate in polite learning, of rigid morals, and eminently pious. He was rather too religious; his religion carrying him into the territories of superstition; and he wanted nothing but a mixture of the philosophic in his nature to make him a very perfect character. Nothing could be more benign, more pacific, more sweet, more moderate, than Rollin's temper. He showed, it must be owned, some zeal for the cause of Jansenism; but in all other respects he was exceedingly moderate. The celebrated poet Rousseau conceived such a veneration for him, that he came out of banishment incognito to Paris on purpose to visit him and pay his respects to him. He looked upon his histories, not only as the best models of the historic kind, but as a complete system of politics and morals, and a most instructive school for princes as well as subjects to learn all their duties in.

Instead of blushing at the lowliness of his birth, Rollin on no occasion hesitated to speak of it. "It is from the Cyclops's shop (says he, in a Latin epigram to one of his friends, to whom he had sent a small sword) that I have taken my flight towards Parnassus." He was not, however, without some share of vanity, especially at hearing mention made of his writings, of which the well-timed praises of his adherents had given him a very high opinion. He spoke without any dissimulation what he thought; and his opinions were less the effect of presumption than of openness of heart. He was one of those men who are vain without any mixture of pride.

Rollin.

Rolling.  
Rollo.

pride. Rollin spoke pretty well; but he had a greater readiness of writing than speaking; and much more satisfaction might be derived from his works than from his conversation. His name became famous throughout Europe; several princes sought the honour of his friendship. The duke of Cumberland and the prince-royal of Prussia (afterwards king) were among the list of his admirers. This monarch honoured him with several letters; in one of which he pays him the following compliment, "Men of your character are fit companions for kings." As to the literary merit of this author, it was, we suspect, too much extolled in his own time, and has been too much undervalued in ours.

**ROLLING**, the motion by which a ship rocks from side to side like a cradle, occasioned by the agitation of the waves.

Rolling, therefore, is a sort of revolution about an imaginary axis passing through the centre of gravity of a ship: so that the nearer the centre of gravity is to the keel, the more violent will be the rolling motion; because the centre about which the vibrations are made is placed so low in the bottom, that the resistance made by the keel to the volume of water which it displaces in rolling, bears very little proportion to the force of the vibration above the centre of gravity, the radius of which extends as high as the mast-heads.

But if the centre of gravity is placed higher above the keel, the radius of vibration will not only be diminished, but an additional force to oppose the motion of rolling will be communicated to that part of the ship's bottom which is below the centre of gravity.

So far as relates to the effect of rolling, when produced by the quality or stowage of the ballast, and to the manner by which it may be prevented, viz. a change of the quantity or disposition of the ballast, we shall endeavour to explain under the article **TAM**. It may, however, be necessary to remark, that the construction of the ship's bottom may also contribute to diminish this movement considerably.

Many fatal disasters have happened to ships arising from a violent rolling; as the loss of the masts, loosening of the cannon, and straining violently on the decks and sides; so as to weaken the ship to a great degree. See **PITCHING**.

**ROLLING-Press**. See **Rolling-Press**.

**ROLLING-Tackle**, a pulley or purchase fastened to that part of a sail-yard which is to the windward of the mast, in order to confine the yard close down to the leeward when the sail is furled.

It is used to prevent the yard from having a great friction against the mast in a high sea, which would be equally pernicious to both.

**ROLLO**, the conqueror of Normandy, was a Norwegian duke, banished from his country by Harold Harfager, who conquered Norway in 870, on account of the piracies he exercised. He first retired with his fleet among the islands of the Hebrides to the north-west of Scotland, whither the flower of the Norwegian nobility had fled for refuge ever since Harold had become master of the whole kingdom. He was there received with open arms by those warriors, who, eager for conquest and revenge, waited only for a chief to undertake some glorious enterprise. Rollo setting himself at their head, and seeing his power formidable, sailed towards England, which had been long as it

were a field open on all sides to the violence of the northern nations. But the great Alfred had some years before established such order in his part of the island, that Rollo, after several fruitless attempts, despaired of forming there such a settlement as should make him amends for the loss of his own country. He pretended, therefore, to have had a supernatural dream, which promised him a glorious fortune in France, and which served at least to support the ardour of his followers. The weakness of the government in that kingdom, and the confusion in which it was involved, were still more persuasive reasons to ensure them of success. Having therefore sailed up the Seine to Rouen, he immediately took that capital of the province, then called *Neustria*, and making it his magazine of arms, he advanced up to Paris, to which he laid siege in form. This war at length ended in the entire cession of Neustria, which Charles the Simple was obliged to give up to Rollo and his Normans in order to purchase a peace. Rollo received it in perpetuity to himself and his posterity, as a feudal duchy dependant on the crown of France. A description of the interview between Charles and this new duke gives us a curious picture of the manners of these Normans (as they were called by foreigners); for the latter would not take the oath of fealty to his sovereign lord any other way than by placing his hands within those of the king; and absolutely refused to kiss his feet, as custom then required. It was with great difficulty he was prevailed on to let one of his warriors perform this ceremony in his stead; but the officer to whom Rollo deputed this service, suddenly raised the king's foot so high, that he overturned him on his back; a piece of rudeness which was only laughed at: to such a degree were the Normans scared, and Charles despised.

Soon after, Rollo was persuaded to embrace Christianity, and he was baptized with much ceremony by the archbishop of Rouen in the cathedral of that city. As soon as he saw himself in full possession of Normandy, he exhibited such virtues as rendered the province happy, and deserved to make his former outrages forgotten. Religious, wise, and liberal, this captain of pirates became, after Alfred, the greatest and most humane prince of his time.

**ROMAN**, in general, something belonging to the city of Rome. See **ROME**.

**KING OF THE ROMANS**, in modern history, is a prince elected to be successor to the reigning emperor of Germany.

**ROMANCE**, in matters of literature, a fabulous relation of certain adventures, designed for the entertainment and instruction of the readers, and differing from the *novel* as it always exhibits actions great, dangerous, and generally extravagant. Many authors of the first name have written on the ancient *romance*. It has exercised the pen of Hurd, of Warburton, and of some ladies, who have not thought it any derogation to the sensibility of their sex to unite antiquarian research with the cultivation of the *belles lettres*. We have not, however, seen anywhere so concise, just, and elegant an account of the origin and progress of *romances* as D'Issrael's *Curiosities of Literature*. "Romance (says this writer) has been elegantly termed the offspring of fiction and love. Men of learning have amused themselves with tracing the epocha of romances. In this research

Rollo.  
||  
Romance.

Romance. research they have displayed more ingenuity than judgment; and some have fancied that it may have existed as far back as the time of Aristotle; Dearchus, one of his disciples, having written several works of this amusing species.

"Let us, however, be satisfied in deriving it from the Theagenes and Charicles of Heliodorus, a bishop who lived in the 4th century, and whose work has been lately translated. This elegant prelate was the Grecian Echeleon (A). Beautiful as these compositions are when the imagination of the writer is sufficiently stored with accurate observations on human nature, in their birth, like many of the fine arts, they found in the zealots of religion men who opposed their progress. However Heliodorus may have delighted those who were not insensible to the felicities of a fine imagination, and to the enchanting elegancies of style, he raised himself, among his brother ecclesiastics, enemies; who at length so far prevailed, that it was declared by a synod, that his performance was dangerous to young persons, and that if the author did not suppress it, he must resign his bishoprick. We are told he preferred his romance to his bishoprick. Even so late as in Racine's time, it was held a crime to peruse these unhallowed pages. He informs us, that the first effusions of his muse were in consequence of studying that ancient romance, which his master observing him to devour with the keenness of a famished man, he snatched it from his hands and flung it in the fire; a second copy experienced the same fate. What could Racine do? He bought a third, and took the precaution of devouring it secretly till he got it by heart; after which he offered it to his master with a smile to burn, if he chose, like the others.

The decision of these bigots was founded in their opinion of the immorality of such works. They alleged, that the writers paint too warmly to the imagination, address themselves too forcibly to the passions; and in general, by the freedom of their representations, hover on the borders of indecency. This censure is certainly well-founded. Many of the old romances, and even of the dramas, acted in Scotland two centuries ago, are such as common prostitutes would in this age think indecent. But we are at present concerned with the origin of romance.

The learned Fleury thinks that they were not known till the 12th century, and gives as their original the history of the dukes of Normandy. Verdier, whose opinion is of no great weight, says the invention of romance was owing to the Normans of France; and that these fictions being originally written in the old Norman language, they were entitled *Normances*; the name was afterwards altered to that of *Romances*. The Spaniards, who borrowed them from the French, called them *Romanzes*, which also did the Italians.

"Dom Rivet, one of the learned associates of the con-

gregation of St Maur, authors of the Literary History of France, fixes their origin in the 10th century. He says, that the most ancient romance known was one which appeared in the middle of that century, under the title of *Philomena*, or *the Beloved*. This romance contains the pretended exploits of Charlemagne before Narbonne. At Toulouse, he tells us, they have preserved a copy of the *Philomena* in its original language; that is to say, the Romanunt or polished; such as was then spoken at court. They preferred this language to the Latin, which was then that of the common people, but vitiated with their corruptions.

"So far have we travelled on the road of conjecture; we shall now turn into the path of fact. It is certain that these compositions derive their name from the language in which they were first written. Abbé Trairid has given us the character of the earliest romances, which we shall transcribe; for to add to what is well expressed, however it may please the vanity of a writer, seldom tends to the gratification of the reader.

"The first romances were a monstrous assemblage of histories, in which truth and fiction were equally blended, but all without probability; a composition of amorous adventures, and all the extravagant ideas of chivalry. The incidents are infinitely multiplied; destitute of connexion, of order, and art. These are the ancient and miserable romances which Cervantes, in his celebrated satirical romance of *Don Quixote*, has covered with an eternal ridicule."

"It is, however, from these productions rather in their improved state, that poets of all nations have drawn their richest inventions. The agreeable wildness of that fancy which characterized the eastern nations was caught by the crusaders. When they returned home, they mingled in their own the customs of such country. The Saracens, who were men like themselves, because they were of another religion, and were therefore their enemies, were pictured under the tremendous form of *Paynim Giants*. The credulous reader of that day followed with trembling anxiety the *Red-cross Knights*. It was thus that fiction embellished religion, and religion invigorated fiction. Such incidents have enlivened the cantos of Ariosto, and adorned the epic of Tasso. Spenser is the child of their creation; and it is certain that we are indebted to them for some of the bold and strong touches of Milton."

Other circumstances however have been assigned as the sources of these extravagant fictions. "Castles were erected to repulse the vagrant attacks of the Normans; and in France (from the year 768 to 987) these places became fatal to the public repose. The petty despots who raised these castles, pillaged whoever passed, and carried off the females who pleased them. Rapine, of every kind, was the privilege of lords! Mezeray observes, that it is from these circumstances romancers have

(A) An ingenious and learned friend inquires, 'Is not the romance of the Golden As, by Apuleius, to be considered as an earlier specimen than that of Heliodorus?' To this our author has no objection; but he would not warrant *any* romance to be the *first* that ever was written. It is thus that some writers, more learned than sagacious, have discovered the first inventor of epistolary correspondence. A lady receives this honour: such learning is desperate! From the Asiatic Researches and other publications on Oriental literature, we are led to believe, that the native country of romance is the east: where it seems to have flourished in all its extravagant grandeur from time immemorial.

Romances. have invented their tales of knights-errant, monsters, and giants.

"De Saint Foix, in his Historical Essays on this subject, thus expresses himself: 'Women and girls were not in greater security when they passed by abbeyes. The monks sustained an assault rather than relinquish their prey: if they saw themselves losing ground, they brought to their walls the relics of some saint. Then it generally happened that the assailants, seized with awful veneration, retired, and dared not to pursue their vengeance. This is the origin of the enchanters, of the enchantments, and of the enchanted castles, described in romances.'

"To these may be added what the author of Northern Antiquities, Vol. I. p. 243, writes, that 'as the walls of the castles ran winding round them, they often called them by a name which signified *serpents* or *dragons*; and in these were commonly secured the women and young maids of distinction, who were seldom safe at a time when so many bold warriors were rambling up and down in search of adventures. It was this custom which gave occasion to ancient romancers, who knew not how to describe any thing simply, to invent so many fables concerning princesses of great beauty, guarded by dragons.'

"The Italian romances of the 14th century were spread abroad in great numbers. They formed the popular literature of the day. But if it is not permitted to authors freely to express their ideas, and give full play to the imagination, these works must never be placed in the study of the rigid moralist. They indeed pushed their indelicacy to the verge of grossness, and seemed rather to seek than to avoid scenes which a modern would blush to describe. They (to employ the expression of one of their authors) were not ashamed to name what God had created, *Cynthia*, *Bandello*, and others, but chiefly *Boccaccio*, rendered libertinism agreeable, by the fascinating charms of a polished style, and a luxuriant imagination.

"This however must not be admitted as an apology for immoral works; for poison is still poison, even when it is delicious. Such works were, and still continue to be, the favourites of a nation which is stigmatized for being prone to illicit pleasures and impure amours. They are still curious in their editions, and are not parsimonious in their price for what they call an uncastrated copy. There are many Italians, not literary men, who are in possession of an ample library of these old novelists.

"If we pass over the moral irregularities of these romances, we may discover a rich vein of invention, which only requires to be released from that rubbish which disfigures it to become of an invaluable price. The *Decamerons*, the *Hecatommithi*, and the *Novellas* of these writers, made no inconsiderable figure in the little library of our Shakespeare. Chaucer is a notorious imitator and lover of them; his *Knight's Tale* is little more than a paraphrase of *Boccaccio's Teseide*. Fontaine has caught all their charms with all their licentiousness. From such works, these great poets, and many of their contemporaries, frequently borrowed their plots; not uncommonly kindled at their flame the ardour of their genius; but bending too submissively to their own peculiar taste, or that of their age, in extracting the ore, they have not purified it of the alloy.

"We must now turn our contemplation to the French romances of the last century. They were then carried to a point of perfection, which as romances they cannot exceed. To this the *Astrea* of D'Urfé greatly contributed. It was followed by the illustrious *Bassia*, the great *Cyrus*, *Clelia*, &c. which, though not adapted to the present age, gave celebrity to their authors. Their style, as well as that of the *Astrea*, is diffuse and insipid. *Zaïde* (attributed by some to Segrais, but by Huet to Madame la Fayette) and the princesses of Cleves are translated, and though they are masterpieces of the kind, were never popular in our country, and are little adapted to its genius.

"It is not surprising that romances have been regarded as pernicious to good sense, morals, taste, and literature. It was in this light they were considered by Boileau; because a few had succeeded, a crowd imitated their examples. Gomberville and Scudery, and a few more were admired; but the satirist dissolved the illusion. This he did most effectually by a dialogue, in which he ridicules those citizens of a certain district, whose characters were concealed in these romances, under the names of Brutus, Horatius Cocles, Lucretius, and Clelia. This dialogue he only read to his friends, and did not give it for a long time to the public, as he esteemed Mademoiselle de Scudery: but when at length it was published, it united all the romance writers against our satirist.

"From romances, which had now exhausted the patience of the public, sprung novels. They attempted to allure attention by this inviting title, and reducing their works from ten to two volumes. The name of romance disgusted; and they substituted those of histories, lives, memoirs, and adventures. In these works (observes Irai) they quitted the unnatural incidents, the heroic projects, the complicated and endless intrigues, and the exertion of noble passions; heroes were not now taken from the throne, they were sought for even amongst the lowest ranks of the people. On this subject, I shall just observe, that a novel is a very dangerous poison in the hand of a libertine; it may be a salutary medicine in that of a virtuous writer." See NOVEL.

ROMAGNA, a province of Italy, in the pope's territories, bounded on the north by the Ferrarese, on the south by Tuscany and the duchy of Urbino, on the east by the gulf of Venice, and on the west by the Bolognese and a part of Tuscany. It is fertile in corn, wine, oil, fine fruits, and pastures. It has also mines, mineral waters, and salt-works, which make its principal revenue. Ravenna is the capital town.

ROMANIA, a province of Turkey in Europe, bounded on the north by Bulgaria, on the east by the Black sea, on the south by the Archipelago and the sea of Marmora, and on the west by Macedonia and Bulgaria; being 200 miles in length and 150 in breadth. It was formerly called *Thrace*, and is the principal and largest of all the provinces the Turks possess in Europe. It is a fruitful country in corn and pastures, and there are mines of silver, lead, and alum. It is divided into three great governments or sangiacates; namely, Kirkel, of which Philipoli is the capital; Galipoli, whose capital is of the same name; and Byzantium, or Bysia, or Viza, of which Constantinople is the capital. The Turks bestow the name

ROMANO (Giulio), a famous painter, was the disciple of Raphael, who had such an affection for him, that he appointed him, with John Francis Perini, his heir. His conceptions were more extraordinary and more elevated than even those of his master, but not so natural. He was wonderful in the choice of attitudes; but did not perfectly understand the lights and shades, and is frequently harsh and ungraceful. The folds of his draperies, says Du Fresnoy, are neither beautiful nor great, easy nor natural, but all extravagant, like the fantastical habits of comedians. He was, however, superior to most painters, by his profound knowledge of antiquity; and, by conversing with the works of the most excellent poets, particularly Homer, he made himself master of the qualifications necessarily required in a great designer. Julio Romano was also well skilled in architecture. He was employed by Cardinal de Medicis, who was afterwards pope under the name of Clement VII.; and afterwards went to Mantua, whither he was invited by Frederic Gonzaga, marquis of that city, in order to avoid his being justly punished for his having drawn at Rome the designs of 20 obscene plates, engraved by Mark Antony, to which Aretine added the same number of sonnets. Julio Romano embellished the city of Mantua with many of his performances both in painting and architecture; and died in that city in 1545, at 54 years of age, much regretted by the marquis, who had an extraordinary friendship for him.

ROME, a very ancient and celebrated city of Italy, situated on the river Tiber, in E. Long, 13°. N. Lat. 41. 45. once the capital of the greatest empire in the world; and famous in modern history for being the centre of an ecclesiastical tyranny, by which for many ages the greatest part of the world was held in subjection.

Romans descended from Aeneas. The ancient Romans derived their origin from Aeneas the Trojan hero: and though some historians pretend to treat his voyage into Italy as a mere fable, yet no sufficient reasons for rejecting this account have been offered, nor has any more probable history of the origin of the Roman name been given; so that, without entering into the dispute, we shall proceed to the history of Aeneas and his successors as they are recorded by the generality of Latin writers.

When the Greeks, by the treachery of the sons of Antenor, or by whatever other means it happened, were become masters of Troy, Aeneas with the forces under his command retired into the fortress of the city, and defended it bravely for some time; but yielding at length to necessity, he conveyed away his gods, his father, wife, and children, with every thing he had that was valuable, and, followed by a numerous crowd of Trojans, fled to the strong places of Mount Ida. Hither all those of his countrymen, who were more anxious than the rest to preserve their liberty, flocked to him from the several towns of Troas. His army thus augmented and advantageously posted, he continued quiet, waiting for the departure of the Greeks, who, it was imagined, would return home as soon as they had pillaged the country. But these, after they had enriched themselves with the spoils of Troy and of the neighbouring towns, turned their arms against the fu-

gitives, resolving to attack them in their strong holds upon the mountain. Aeneas, to avoid the hazard of being forced into his last refuge, had recourse to negotiation; and, by his heralds, entreated the enemy not to constrain him to a battle. Peace was granted him, on condition that he with his followers quitted the Trojan territories; and the Greeks, on their part, promised not to molest him in his retreat, but to let him safely pass through any country within the extent of their domination.

Upon this assurance Aeneas equipped a fleet, in order to seek a settlement in some foreign land. We are told, that at his departure he left his eldest son Ascanius with the Dasylics, a people of Bithynia, who desired to have him for their king; but that the young prince did not remain long with them: for when Scamandrius (Alyanax), with the rest of the Hectorians whom Neoptolemus permitted to return home from Greece, repaired to him, he put himself at their head, and led them back to their native country.

The Trojan having crossed the Hellespont, arrived in the peninsula of Pallene, where he built a city, called from him *Aeneia*, and left in it a part of that multitude which had followed him. From thence he sailed to Delos; and thence to Cythra, where he erected a temple to Venus. He built another to the same goddess in Zacynthus, in which island he likewise instituted games, called the *games of Aeneas and Venus*: the statues of both, says Dionysius, are standing to this day. In Locris, where the Trojans landed, was to be seen in the same author's time, a temple erected to Venus the mother of Aeneas. Near to Achaia and Calabria without monuments that testified his arrival at those places. At Dodona were found fragments upon which the name of the Trojan hero was found made an offering of thank to Jupiter, was ascribed to old characters. Not far from Buthrotum, in Epirus, a Trojan camp which had escaped the injuries of time, retained the name of *Troja*. All these antiquities, still subsisting in the reign of Augustus, were then looked upon as indisputable proofs of Aeneas's voyage to Epirus: "and that he came to Italy (adds the same Dionysius) we have the concurrent testimony of all the Romans; the ceremonies they observe in their sacrifices and festivals bear witness to it, as also the Sibylline books, the Pythian oracles, and many other things which nobody can reasonably reject as invented merely for ornament."

The first land of Italy which Aeneas made, after crossing the Ionian sea, was Cape Minerva, in Japygia; and here he went on shore. Sailing afterwards from hence, and coasting along the south-east of Italy and the east and south sides of Sicily, he arrived with his fleet either by choice or by stress of weather at the port of Drepanum in that island. Elymus and Egegestus, who had escaped from Troy a little before him, had brought a Trojan colony to this place. Aeneas augmented it by a good number of his followers, whom, pleased to have found a safe resting place after many dangers and fatiguing voyages, he willingly left behind him at their request; though certain authors pretend that he was constrained to it by the difficulty of transporting them, because some Trojan women, weary of the sea, had burnt a considerable part of his ships.

Aeneas, leaving Drepanum, steered his course for Italy

2  
Aeneas flies from Troy to Mount Ida.

Rome.

taly across the Tyrrhenian sea. To the cape where he first landed, he gave the name *Palinurus*, from one of his pilots who died there. The little island of *Leucasia*, not far distant, whether he sailed next, got its name in like manner from a daughter of *Æneas's* sister, who there ended her days. The port of *Misenum*, the island of *Præhyta*, and the promontory of *Cajeta*, where he successively arrived, were so called from being the burial places, the first of a noble Trojan his companion, the second of his kinswoman, and the third of his nurse. At length the Trojan prince and his chosen band finished their tedious and painful voyages on the coast of the since famous *Latium*. This was a small territory on the east side of the river *Tiber*, containing a part of the present *Campagna di Roma*: *Latinus* was the king of it; his capital town, *Laurentum*; his subjects, a people who, till his time called *Aborigines*, had from him taken the name of *Latins*. Here, far removed from their implacable enemies the Greeks, *Æneas* and his followers undertook to raise a second *Troy*; they fortified a camp near the mouth of the *Tiber*, gave it the name of *Troy*, and flattered themselves with the hopes of a quiet settlement, and a period to all their unhappy adventures.

4  
Lands in  
Italy.

When *Æneas* arrived in Italy, *Latinus* was engaged in a war with the *Rutuli*, a neighbouring people, in which he was attended but with very indifferent success, when news was brought him that a foreign army had made a descent on his coasts, pillaged the maritime part of his dominions, and were fortifying themselves in a camp at a small distance from the sea. Hereupon he marched against them with all his forces, hoping to oblige them to retire, and abandon his dominions;

meeting with great resistance from a numerous body of well-armed, and regularly drawn up, he found it

it advisable to forbear engaging troops that so well disciplined; and, instead of venturing to desire a parley. In this conference *Latinus*, understanding who they were, and being at the same time struck with terror, and touched with compassion for those brave but unfortunate men, entered into a treaty with them, and assigned them a tract of land for a settlement, on condition that they should employ their arms and exert their valour in defence of his dominions, and look upon the *Rutuli* as a common

enemy. This condition *Æneas* readily accepted; and complied with his engagement so faithfully, that *Latinus* came at length to repose an entire confidence in the Trojan; and in proof of it gave him *Lavinia*, his daughter and only child, in marriage, securing to him by that means the succession to the throne of *Latium*. *Æneas*, to testify his gratitude to *Latinus*, and affection for *Lavinia*, gave her name to the camp he had pitched; and instead of *Troy* called it *Lavinium*. The Trojans followed the example of their leader; and by making alliances with Latin families, became, in a short time, one and the same people with the *Latins*.

In the mean time *Turnus*, the queen's nephew, who had been brought up in the palace under the eye of *Latinus*, and entertained hopes of marrying *Lavinia* and succeeding to the throne, seeing the prince's bestowed on a stranger, and all his views defeated, went

over to the *Rutuli*; and by stirring them up, brought on a battle between them and the *Latins*, in which both he and *Latinus* were killed. Thus *Æneas*, by the death of his father-in-law, and by that of a troublesome rival, came into the quiet possession of the kingdom of *Latium*, which he governed with great wisdom, and transmitted to his posterity.

Rome.

*Æneas* is said to have reigned three years; during which time he established the worship of the gods of his own country, and to the religion of the *Latins* added that of *Troy*. The two *Palladiums*, which had been the protectors of that city, became the tutelary deities of *Lavinium*, and, in after ages, of the whole Roman empire. The worship of *Vesta* was likewise introduced by *Æneas*; and virgins, from her called *Vestals*, were appointed to keep a fire continually burning in honour of that goddess. *Jupiter*, *Venus*, and many other deities who had been revered in *Troy*, became, in all likelihood, known to the *Latins* by means of *Æneas*; which gave occasion to the poets of representing him under the character of a pious hero.

While *Æneas* was thus employed, the *Rutuli*, ancient enemies of the Latin name, entering into an alliance with *Mezentius* king of the *Tyrrhenians*, took the field with a design to drive out those new-comers, of whose power they began to conceive no small jealousy. *Æneas* marched out against them at the head of his Trojans and *Latins*. Hereupon a battle ensued, which lasted till night; when *Æneas* being pushed to the banks of the *Numicus*, which ran close by *Lavinium*, and forced into that river, was there drowned. The Trojans concealed his body; and pretending that he had vanished away on a sudden, made him pass for a deity among his credulous subjects, who accordingly erected a temple to him under the title of *Jupiter Indiges*.

6  
His death.

Upon the death of *Æneas*, his son *Euryleon*, called also *Ascanius* and *Iulus*, ascended the throne; but as the young king did not think it advisable to venture a battle in the very beginning of his reign, with a formidable enemy, who promised himself great success from the death of *Æneas*, he had the prudence to confine himself within the walls of *Lavinium*, and to try whether he could, by an honourable treaty put an end to so dangerous a war. But the haughty *Mezentius* demanding of the *Latins*, as one of the conditions of a peace, that they should pay him yearly, by way of tribute, all the wine produced in the territory of *Latium*, *Ascanius* rejected the proposal with the utmost indignation; and having caused all the vines throughout his dominions to be consecrated to *Jupiter*, and by that means put it out of his power to comply with the enemy's request, he resolved to make a vigorous sally, and try whether he could, by force of arms, bring the insulting *Tyrrhenian* to more reasonable terms. The main body of the enemy's army was encamped at some distance from *Lavinium*; but *Lausus*, the son of *Mezentius*, with the flower of their youth under his command, lay intrenched at the very gates of the city. The Trojans, who had been long accustomed to make vigorous sallies, marching out in the night, attacked the post where *Lausus* commanded, forced his intrenchments, and obliged the troops he had with him to save themselves by flying to the main body of the army encamped on the plain; but the unexpected arrival and overthrow

overthrow of their advance-guard struck them with such terror, that, instead of stopping the flight of their companions, they fled with them, in great disorder, to the neighbouring mountains. The Latins pursued them; and in the pursuit, Lausus was killed; whose death so discouraged Metentius, that he immediately sued for peace; which was granted him, upon condition, that for the future the Tiber should be the boundary between the Latin and Hetrurian territories.

In the mean time Lavinia, who had been left with child by Æneas, entertaining a strong jealousy of the ambition of her son-in-law, retired to the woods, and was there peaceably delivered of a son, who, from his father, was named *Æneas*, and, from the place of his birth, had the surname of *Sylvius*: but as the queen's flight, who had disappeared on a sudden, raised suspicions at Lavinium prejudicial to the reputation of Ascanius, he used all possible means to remove them, caused diligent search to be made after Lavinia, calmed her fears, and prevailed upon her to return to the town with her son, whom he ever after treated as a brother. Lavinium grew every day more populous; but as it was in reality the patrimony of Lavinia, and the inheritance of her son Sylvius, Ascanius resolved to resign it to them, and build elsewhere another city for himself. This he made the place of his residence, and the capital of his new kingdom, calling it *Alba Longa*; *Alba*, from a white sow, which we are told Æneas had found in the place where it was built; and *Longa*, to distinguish it from another town of the same name in the country of the Marsi; or rather, because it extended without having much breadth, the whole length of a lake near which it was built. It was 30 years after the building of Lavinium that Ascanius fixed his abode at Alba; and there he died, after a reign of about 38 years, 12 of which he had resided at his new settlement. He left a son called *Iulus*; so that between him and Sylvius lay the right of succession to the Latin throne; the latter being the son, and the former the grandson, of Æneas.

The Latins not thinking it their interest to continue divided, as it were, into two states, resolved to unite Alba and Lavinium into one sovereignty; and as Sylvius was born of Lavinia the daughter of Latinus, and had thereby an undoubted title to the kingdom of his grandfather, whereas the other was but the son of a stranger, the Latins bestowed the crown on Sylvius; and, to make Iulus some amends, decreed to him the sovereign power in affairs of religion; a power which thenceforth continued in his family. Sylvius was succeeded by 13 kings of the same race, who for near 400 years reigned at Alba; but we scarce know any thing of them besides their names, and the years of their respective reigns. Æneas Sylvius died, after a reign of 29 years. His son, called also *Æneas Sylvius*, governed Latium 31 years. *Latinus Sylvius*, who succeeded him, swayed the sceptre for the space of 51 years. Alba reigned 39; Capetus, by Livy named *Allys*, 26; Capys, 28; and Capetus, 13. Tiberinus, who succeeded him, engaged in a war which proved fatal to him; for in battle which was fought on the banks of the Albula, he was forced into that river and drowned. From him the river took the name of *Tiber*, which it has borne ever since. Agrippa succeeded Tiberinus after a reign of eight years; and left the throne, which

he had held 41 years, to Alladius; who reigned 19, and was succeeded by Aventinus, who left his name to the hill Aventinus, where he was interred. Procas, who succeeded him, and reigned 23 years, was the father of Numitor and Amulius; and at his death bequeathed the throne to his elder son Numitor. But Amulius, who surpassed his brother in courage and understanding, drove him from the throne; and to secure it to himself, murdered Ægeus, Numitor's only son; and consecrated his daughter Rhea Sylvia to the worship of Vesta, by which she was obliged to perpetual virginity; but this precaution proved ineffectual; for as the goddess was going to a neighbouring spring to fetch water for the performance of a sacrifice to Mars, she was seized and ravished by a man in a military habit, like that in which the god Mars is represented. Some authors think that this counterfeit Mars was a lover come off by her appointment; others charge Amulius himself with using this violence to his niece, not so much to gratify his lust, as to have pretence to destroy her. For ever after he caused her to be carefully watched, till she was delivered of two sons; and then exaggerating her crime in an assembly of the people, he prevailed upon them to sentence her to death, and to condemn the fruit of her criminal amour to be thrown into the Tiber. The sentence against Rhea was, according to some authors, changed by Amulius, at the request of his daughter, into perpetual confinement; but executed against the twins; who being laid in a wooden trough, and carried to the foot of Mount Palatine, were there thrown down the Tiber, where they were overpowered by a shark. But the gods, who were both so favourably disposed to the children, preserved the infants; and carried them to the foot of Mount Palatine, where they were found by a shepherd, and brought up by a shepherd's wife. For her goodness she was called *Lupa*; and the twins, who probably gave rise to the tradition, were called *Romulus* and *Remus*, by a wolf.

As Faustulus was probably well acquainted with the birth of the twins, he took more than ordinary care of their education, and sent them to Cambr to be instructed there in Greek literature. As they grew up, they appeared to have something great in their mind and air which commanded respect; and the ascendancy which they assumed over the other shepherds made them dreaded in the forests, where they exercised a sort of empire. A quarrel happening between the herdsmen of Amulius and those of Numitor, the two brothers took the part of the former against the latter; and some blood being shed in the fray, the adverse party, to be revenged on *Romulus* and *Remus* (for so the twins were called) on the festival of Lupercalia, surprised Remus, and carried him before Numitor, to be punished according to his orders. But Numitor feeling himself touched in the prisoner's favour, asked him where he was born, and who were his parents. His answer immediately struck Numitor with a lively remembrance of his two grandsons; their age, which was about 18 years, agreed with the time when the two infants were exposed upon the Tiber; and there needed no more to change his anger into tenderness.

In the mean time Romulus, eager to rescue his brother, and pursue those who had carried him off, was preparing to be revenged on them; but Faustulus dis-

Rome, persuaded him from it; and on that occasion, disclosing to him his birth, awakened in his breast sentiments worthy of his extraction. He resolved, at all adventures, to attempt the delivering of his mother and grandfather from oppression. With this view he assembled the country people, over whom he had assumed a kind of sovereignty, and engaged them to come to the city on an appointed day, and enter it by different gates, provided with arms, which they were to conceal. While Romulus was thus disposing every thing for the execution of his design, Numitor made the same discovery to Remus concerning his parents, and the oppressions they groined under; which so fired him, that he was ready to embark in any enterprise. But Numitor took care to moderate the transports of his grandson, and only desired him to acquaint his brother with what he had heard from him, and to send him to his house. Romulus soon came, and was followed by Faustulus, who took with him the trough or skiff in which the twins had been exposed, to show it to Numitor: but, as the shepherd betrayed an air of concern and earnestness in his looks, he was stopped at the gate of the city, led before Amulius, and examined concerning his burden. It was easily known by its make and inscription, which was still legible; and therefore Faustulus owned what it was, and confessed that the twins were living; but, in order to gain time, pretended that they were feeding in a remote desert. In the mean time, the prince's death being resolved on, Remus undertook to rob the city and Romulus to invest the king's palace. The country people came at the time appointed, and Romulus, having collected a company of 100 men, set out for the city, and the king's palace, at that time, was the seat of the king's power. Remus, on the other hand, having collected a company of 100 men, set out for the city, and the king's palace, at that time, was the seat of the king's power. Remus, on the other hand, having collected a company of 100 men, set out for the city, and the king's palace, at that time, was the seat of the king's power.

15  
They resolve to found a colony.

After being thus settled at Alba, the two brothers, by the advice of Numitor, undertook the founding of a new colony. The king bestowed on them those lands near the Tiber where they had been brought up, supplied them with all manner of instruments for breaking up ground, with slaves, and beasts of burden, and granted full liberty to his subjects to join them. Hereupon most of the Trojans, of whom there still remained 50 families in Augustus's time, chose to follow the fortune of Romulus and Remus, as did also the inhabitants of Pallantium and Saturnia, two small towns. For the more speedy carrying on of the work, it was thought proper to divide those who were to be employed in the building of the city into two companies, one under the command of Romulus, the other of Remus; but this division, which was designed purely with a view to the public welfare, and that the two parties might work by way of emulation, gave birth to two factions, and produced a jealousy between the two brothers, which broke out when they came to choose a place for the building of their new city; for Remus was for the Aventine, and Romulus for the Palatine mount. Upon which, the matter being referred to their grandfather, he advised the contending parties to have recourse to the gods, and to

Vol. XVI. Part I.

put an end to the dispute by augury, to which he was himself greatly addicted. The day appointed for the ceremony being come, the brothers posted themselves each upon his hill; and it was agreed, that whoever should see the first sight, or the greatest number of vultures, should gain his cause. After the two rivals had waited some time for the appearance of a favourable omen, Romulus, before any had appeared, sent to acquaint his brother that he had seen some vultures; but Remus, having actually seen six, while his brother's messengers were yet on their way, hastened, on their arrival, to Mount Palatine, to examine the truth of what they had told him. He had no sooner got thither, than by an unexpected good fortune twelve vultures appeared to Romulus. These he immediately showed to his brother; and transported with joy, desired him to judge himself of the truth of what his messengers had told him. However, Remus discovered the deceit; and, being told that Romulus had not seen the twelve vultures till after he had seen six, he insisted on the time of his seeing them, and the other on the number of birds he had seen. This widened the breach between the two brothers; and, their parties being divided, while each man espoused the cause of his leader, the dispute grew so warm, that, from words they came at length to blows. The shepherd Faustulus, who was equally dear to both the brothers, endeavouring to part the combatants, was by an unknown hand laid dead on the spot. Some writers tell us, that Remus likewise lost his life in the fray; but the greater number place his death later, and say that he was killed by one Fabius, for having, in derision, leaped over the wall of the new city; but Livy says, the more common report was, that Remus fell by the hand of his brother.

16  
Death of Remus.

Romulus, being now head of the colony, by having got the better of his brother's party in the late engagement, applied his thoughts wholly to the building of the city, which he proposed to call after his own name. He chose Mount Palatine for its situation, and performed all those ceremonies which the superstition of the Hetrurians had introduced. He first offered sacrifices to the gods, and ordered all the people to do the same; and from that time decreed, that eagles should be the auspices of his new colony. After this, great fires were kindled before their tents, and all the people leaped through the flames to purify themselves. When this ceremony was over, they dug a trench round the spot where the assemblies of the people were afterwards held, and threw into it the first-fruits of whatever they were allowed to make use of for food; every man of the colony was ordered to cast into the same trench a handful of earth, brought either from his own or some neighbouring country. The trench they called *Mundus*, that is, *the world*, and made it the centre round which the city was to be built. Then Romulus, yoking an ox and a cow to a plough, the coulter whereof was brass, marked out, by a deep furrow, the whole compass of the city. These two animals, the symbols of marriage, by which cities are peopled, were afterwards slain upon the altar. All the people followed the plough throwing inwards the clods of earth which the ploughshare sometimes turned outwards. Wherever a gate was to be made, the plough was lifted up, and carried; and hence came the Latin word *porta*, "a gate," de-

17  
Foundation of Rome.

Rome

rived from the verb *portare*, "to carry." As Mount Palatine stood by itself, the whole was enclosed within the line made by the plough, which formed almost the figure of a square; whence, by Dionysius Halicarnassensis, it is called *Roma Quadrata*.

As to the exact year of the foundation of Rome, there is a great disagreement among historians and chronologists. Fabius Pictor, the most ancient of all the Roman writers, places it in the end of the seventh Olympiad; that is, according to the computation of Usher, in the year of the world 3256, of the flood 1600, and 748 before the Christian era. The Romans, if we may so call them, began to build, as Plutarch and others inform us, on the 21st of April; which day was then consecrated to Pales, goddess of the shepherds; whence the festival of Pales, and that of the foundation of the city, were afterwards jointly celebrated at Rome.

18  
At first but  
a poor vil-  
lage.

When Rome had received the utmost perfection which its poor and rude founder could give it, it consisted of about 1000 houses, or rather huts; and was properly speaking a beggarly village, whereof the principal inhabitants followed the plough, being obliged to cultivate with their own hands the ungrateful soil of a barren country which they had shared among themselves. Even the walls of Romulus's palace were made of rushes, and covered with thatch. As every one had chosen his ground to build upon, without any regard to the regularity and beauty of the whole, the streets, if we may so call them, were both crooked and narrow. In short, Rome, till it was rebuilt after the burning of it by the Gauls, was rather a disorderly heap of huts, than a city built with any regularity or order.

19  
Romulus  
elected  
king

As soon as the building of the city was finished, Romulus assembled the people, and desired them to choose what kind of government they would obey. At that time monarchy was the unanimous voice of the Romans, and Romulus was elected king. Before he ascended the throne, however, he consulted the will of the gods by augury; and having received a favourable answer, it thence became an established custom to have recourse to augury before the raising any one to the dignity of king, priest, or any public employment. After this he applied himself to the establishment of good order and subordination among his subjects. He put on a habit of distinction for himself, appointed 12 lictors to attend him as guards, divided his subjects, who at this time consisted only of 33,000 men, into *curia*, *decurie*, *patricians*, *plebeians*, *patrons*, *clients*, &c. for an account of which, see these articles as they occur in the order of the alphabet. After this he formed a senate consisting of 100 persons, chosen from among the patricians; and a guard of 300 young men called *celeris*, who attended the king, and fought either on foot or on horseback as occasion required. The king's office at home was to take care of religious affairs, to be the guardian of laws and customs; to decide the weightier causes between man and man, referring those of smaller moment to the senate; to call together the senators and assemble the people, first delivering his own opinion concerning the affair he proposed, and then ratifying by his consent what was agreed on by the majority. Abroad, and in the time of war, he was to command the army with absolute authority, and to take care of the public money. The senate were not only to be judges in matters of small

Rome.

importance, but to debate and resolve upon such public affairs as the king proposed, and to determine them by a plurality of voices. The people were allowed to create magistrates, enact laws, and resolve upon any war which the king proposed; but in all these things the consent of the senate was necessary.

Romulus next proceeded to settle the religious affairs of his people. Many of the Trojan and Phrygian deities were added to those whom the Aborigines or Italian natives already worshipped. He chose priests, instituted festivals, and laid the foundation of a regular system of religion; after which, as his colony was still thinly peopled, he opened an asylum for fugitive slaves, homicides, outlaws, and debtors. These however, he did not at first receive within the walls, but appointed for their habitation the hill Saturnius, called afterwards *Capitolinus*, on which he erected a temple to a deity of his own invention, whom he named the *Astyler*, under whose protection all criminals were to live securely. But afterwards, when the city was enlarged, the asylum was enclosed within the walls, and those who dwelt in it included among the citizens of Rome.

20

When Romulus had thus settled every thing relating to his new colony, it was found that a supply of women was wanting to perpetuate its duration. This occasioned some difficulty; for the neighbouring nations refused to give their daughters in marriage to such a crew of vagabonds as had settled in Rome; wherefore Romulus at last resolved on the following expedient. By the advice of his grandfather Numitor, and with the consent of the senate, he proclaimed a solemn festival and public games in honour of the Equestrian Neptune, called *Consus*. This occasioned a great concourse of people, who flocked from the adjacent parts to behold such pompous shows, together with the men chosen to be in the midst of the solemnity, the Romans, armed with their swords drawn, seized all the young women, the number of 683, for whom Romulus chose husbands. Among all those who were thus seized, only one unmarried woman, named *Herfilia*, was found; and Romulus is said to have kept her for himself.

21

This violence soon brought on a war with the neighbouring nations. Acron king of Cæcina, a city on the confines of Latium, having entered into a league with the inhabitants of Crustumium and Antemna, invaded the Roman territories. Romulus marched against them without delay, defeated the confederate army, killed their king in single combat, decreed himself a triumph, and consecrated the spoils of Acron to Jupiter Feretrius, under the name of *Opima Spolia*. The city of Cæcina was razed to the ground, and the inhabitants transplanted to Rome, where they were admitted to the privileges of citizens. The king then marched with one legion (consisting at this time of 3000 foot and 300 horse) against the Crustumini and Antemnates, both of whom he defeated in battle, and transplanted the inhabitants to Rome; which being incapable of holding such a number, Romulus took in the hill Saturnius above-mentioned, on the top of which he built a citadel, committing the care of it to a noble Roman named *Tarpeius*. The citadel was surrounded on all sides with ramparts and towers, which equally commanded the city and country. From the foot of the hill Saturnius a wall was carried on quite to the Tiber, and a gate opened

22  
Rome en-  
larged.

Rome. opened in it named *Carmentalis*, from Carmenta the mother of Evander, who either lived there, or had some chapel or altar erected to her.

Romulus had now become so formidable to his neighbours, and had so well established his reputation for clemency, that several cities of *Hetruria* voluntarily submitted to him. *Celias*, an *Hetrurian* general, led the troops under his command to Rome, and settled on a hill near the city, which from him took the name of *Mount Celius*. The *Sabines*, however, not in the least dismayed at this increase of the Roman forces, sent a deputation to Romulus, demanding restitution of the young women who had been carried off; and upon his refusal marched to Rome with an army of 25,000 foot and 1000 horse, under the command of

23 Invasion of their king *Titus Tatius*. Romulus, having received the *Sabines*, supplies from *Numitor* and from *Hetruria*, likewise took the field, with 20,000 foot and 800 horse, with whom he seized an advantageous post, and fortified himself so strongly, that he could not be attacked. The *Sabine* monarch, perceiving the military skill of Romulus, began to be apprehensive of the event: but was

24 The citadel of *Tarpeia* daughter to the governor of the citadel, who agreed to betray that important fortress to the enemy, on condition of being rewarded with the bracelets which the *Sabines* wore on their left arms. But when once they became masters of this important place, they are said to have crushed *Tarpeia* under the weight of their bucklers, pretending that thus they discharged their promise, as they wore their bucklers also on their left arms. The possession of the citadel enabled the *Sabines* to carry on the war with more success; but, in a general engagement, they had the misfortune to be driven back into the citadel, whither they were pursued by the *Romans*, who expected to have taken that important post; but the enemy, rolling down a great stone from the top of the hill, wounded *Evander* on the head, so that he was carried insensible out of the field of battle, while, in the mean time, his troops were repulsed, and pursued to the very gates of Rome. However, the king soon recovering himself, encouraged his routed troops, and drove the enemy back into the citadel. But while the two nations were thus fiercely contending, the women, for whose cause the war had been commenced, undertook the office of mediators; and having obtained leave from the senate, marched in a body to the camp of the *Sabines*, where they pleaded the cause of their husbands so effectually, that a treaty of union between the two nations was set on foot, and a peace was at last concluded, on the following terms: 1. That the two kings should reside and reign jointly at Rome, 2. That the city should still, from Romulus, be called *Rome*; but the inhabitants *Quirites*, a name till then peculiar to the *Sabines*. 3. That the two nations should become one; and that the *Sabines* should be made free in Rome, and enjoy all the privileges of Roman citizens. As Rome was chiefly indebted for this increase of her power and splendour to the *Sabine* women, honourable privileges and marks of distinction were allowed them. Every one was commanded to give way to them; in capital causes they were exempted from the jurisdiction of the ordinary judges; and their children were allowed to wear a golden ball hanging from their necks,

25 Peace concluded, and the two nations united.

and a particular kind of robe called *prætexta*, to distinguish them from the vulgar. Rome.

The two kings reigned with great harmony for the space of five years; during which time the only military exploit they accomplished was the reduction of the city of *Cameria*, at a small distance from Rome. Four thousand of the *Camerini* were transplanted to Rome, and a Roman colony sent to repopulate *Cameria*; soon after which the *Sabine* king was murdered by the *Lavinians*, *Tatius* murdered on account of his granting protection to some of his doted friends who had ravaged their territories. The *Lavinians*, fearing the resentment of Romulus, delivered up the assassins into his hands; but he sent them back unpunished, which gave occasion to suspect that he was not displeased with the death of his colleague.

Soon after the death of *Tatius*, Rome was afflicted with famine and pestilence, which encouraged the *Camerini* to revolt; but Romulus marching against them suddenly, defeated them with the loss of 6000 men. After which he attacked the *Fidenates*, whose city stood about five miles from Rome, took their capital, and made it a Roman colony. This drew upon him the resentment of the *Veientes*, a powerful nation in the neighbourhood, who claimed *Fidene* as within their jurisdiction; but their forces being defeated in two engagements, and a great number of them taken prisoners, they were obliged to sue for peace. Romulus granted them a truce for 100 years, on condition that they delivered to him seven small towns on the *Tiber*, together with some salt pits near the mouth of that river, and sent 50 of their chief citizens as hostages to Rome. The prisoners taken in this war were all sold for slaves.

The remaining part of the life of Romulus was spent in making laws for the good of his people; but towards the latter end of his reign, being elated with success, he began to enlarge the bounds formerly set to his prerogative, and to behave in an arbitrary manner. He paid no longer any regard to the voice of the senate, but assembled them only for form's sake to ratify his commands. The senate therefore conspired to destroy him, and accomplished their purpose while he was reviewing his troops. A violent storm of hail and thunder dispersed the army; and the senators taking this opportunity, when they were left alone with the king, instantly killed him, and conveyed his body out of sight. Some writers tell us, that, the better to conceal the fact, they cut his body in pieces, each of them carrying away a part under his robe; after which they told the multitude, that their king was on a sudden surrounded by flame, and snatched up into heaven. This stratagem, however, did not satisfy the soldiery, and violent disturbances were about to ensue, when *Julius Proculus*, a senator of great distinction, having assembled the curia, told them that Romulus had appeared to him, and enjoined him to acquaint the people, that their king was returned to the gods from whom he originally came, but that he would continue to be propitious to them under the name of *Quirinus*; and to the truth of this story *Julius* swore.

Romulus reigned, according to the common computation, 37 years: but some historians reduce the length of his reign to little more than 17; it being very unlikely, as they observe, that a prince of such an active disposition should perform nothing worthy of

Rome. record during a period of 20 years. Be this as it will, however, the death of Romulus was followed by an interregnum, during which the senators, to prevent anarchy and confusion, took the government into their own hands: Tatius added another hundred to that body; and these 200 senators divided themselves into decuries or tens. These decuries drew lots which should govern first; and the decury to whose lot it fell enjoyed the supreme authority for five days; yet in such a manner, that one person only of the governing decury had the ensigns of sovereignty at a time. To these another decury succeeded, each of them sitting on the throne in his turn, &c. But the people soon growing weary of such frequent change of masters, obliged the senate to resolve on the election of a king. The senate referred the election to the people, and the people to the senate, who at last undertook the task. Some difficulties, however, occurred: the Romans did not choose to be subject to a Sabine; and the Sabines, as they had been subject to Romulus after the death of Tatius, insisted that the king should be chosen out of their nation. At last it was agreed, that the king should be a Sabine, but that the Romans should make the choice.

29 Numa Pompilius the second king. In consequence of this determination, the Romans elected Numa Pompilius, an austere philosopher, who had married Tatia, the daughter of Tatius the late king. After the death of his wife, he gave himself entirely up to philosophy and superstition, wandering from solitude to solitude, in search of sacred woods and fountains, which gave the people a great opinion of his sanctity. The philosopher at first rejected the offer of the kingdom; but being at last prevailed upon, he set out for Rome, where he was received with loud acclamations, and had his election unanimously confirmed by the senate.

The reign of Numa is by no means memorable for battles or conquests. He was averse to war; and made it his study to soften the manners of the Romans, rather than to exalt them to superiority over their neighbours. He dismissed the celeres, encouraged agriculture, and divided the citizens into distinct bodies of tradesmen. This last measure he took on purpose to abolish the distinction between Romans and Sabines, which had hitherto rent the city into two factions; and this effectually answered his end: for now all of each particular profession, whether Romans or Sabines, were obliged to associate together, and had each their respective courts and privileges. In this division the musicians held the first rank, because they were employed in the offices of religion. The goldsmiths, carpenters, curriers, dyers, taylor, &c. formed also distinct communities; and were allowed to make by-laws among themselves, to have their own festivals, particular sacrifices, &c.

Though Numa himself is said by Plutarch to have had pretty just notions of the Supreme Being, he nevertheless added innumerable superstitions to those he found in Rome. He divided the ministers of religion into eight classes, appointing to each their office with the greatest precision; he erected a temple to Janus, the symbol of prudence, which was to remain open in time of war, and to be shut in time of peace. Another temple was erected to *Bona Fides*; and he invented a new kind of deities called *Dii Termini*, or

Rome. boundaries, which he caused to be placed on the borders of the Roman state, and of each man's particular lands.—The last reformation which Numa undertook, was that of the calendar. Romulus had divided his year into ten months, which, according to Plutarch, had no certain or equal number of days; some consisting of 20, some of 35, &c. However, by other historians, we are informed that he allotted to March, May, Quintilis, and October, 31 days; to April, June, Sextilis, November, and December 30; making in all 304 days. But Numa being better acquainted with the celestial motions, added to these the two months of January and February. To compose these two months he added 50 days to the 304; and thus made the year answer to the course of the moon. He then took six more from the months that had even days; and added one day merely out of superstition, that the year might prove fortunate; for the Pagans looked upon even numbers as unlucky, but imagined odd numbers to be fortunate. However, he could make but no more than 28 for February, and therefore that month was always reckoned unlucky among the Romans. Besides this, he observed the difference between the solar and lunar year to be 11 days; and to remedy the inequality, he added an intercalary month named *Mercidius* or *Mercidonus*, of 22 days every two years; but as he knew also that the solar year consisted of 365 days 6 hours, he ordered that every fourth year the month Mercedius should consist of 23 days. The care of these intercalations was left to the priests, who left out or put in the intercalary day or month as they imagined it to be lucky or unlucky; and by that means created such confusion, that the festivals came in profuse of time to be kept at a festival as usual to what they had been formerly.

30 These are all the remarkable events of the second reign of Numa, which is said to have lasted 43 or 45 years; though some think that its duration could not be above 15 or 16. His death was followed by a short interregnum; after which Tullus Hostilius, the son or grandson of the famous Hostilia, was unanimously chosen king. Being of a bold and fiery temper, he did not long continue to imitate his peaceful predecessor. The Alban, indeed, soon gave him an opportunity of exercising his martial disposition. Caelius, or, as he is called by Livy, Cluilius, who was at the head of the Alban republic, jealous of the growing greatness of Rome, privately commissioned some of the most indigent of his subjects to waste the Roman territory; in consequence of which, a Roman army entered the territories of Alba, engaged the robbers, killed many, and took a great number prisoners.

31 A war soon commenced, in consequence of this, between the two nations; but when the armies came in sight of each other, their ardour cooled, neither of them seeming inclined to come to an engagement. This inaction raised a great discontent in the Alban army against Cluilius; inasmuch that he came to a resolution of giving battle to the Romans next morning, or of storming their trenches if they should decline it. Next morning, however, he was found dead in his bed; after which the Albans chose in his stead one Mettus Fuffetius, a man remarkable for his hatred to the Roman name, as Cluilius had been before him. Fuffetius, however continued in the same state

Rome. state of inactivity as his predecessor, until he received certain intelligence that the Veientes and Fidenates had resolved to destroy both Romans and Albans when they should be weakened by a battle. Fufetius then resolved to come to an accommodation with the Romans; and, having obtained a conference with Tullus, both seemed equally desirous of avoiding the calamities of war. But, in order to establish the peace on the most perfect foundation, Tullus proposed that all, or at least the chief families in Alba, should remove to Rome; or, in case they were unwilling to leave their native city, that one common council should be established to govern both cities under the direction of one of the two sovereigns. Fufetius took aside those who attended him, to consult with them about this proposal; but they, though willing to come to an accommodation with Rome, absolutely refused to leave Alba. The only difficulty remaining, then, was to settle which city should have the superiority; and, as this could not be determined by argument, Tullus proposed to determine it by single combat between himself and Fufetius. This proposal, however, the Alban general thought proper to decline; and it was at last agreed, that three champions should be chosen out of each camp to decide the difference. This produced the famous combat between the Horatii and Curiatii, by which the sovereignty was decided in favour of Rome. See HORATII.

Tullus now resolved to call the Fidenates to an account for their treacherous behaviour during the war with Alba, and therefore cited them to appear before the senate; but they, conscious of their guilt, refused to appear, and took up arms in conjunction with the Veientes. Fufetius, in obedience to the orders of Tullus, joined his wife and the Roman troops; but the Veientes, who were the principal auxiliaries, which was to stand neuter till Tullus had declared for one side, and then to join with the conqueror. This design being approved, Fufetius, during the engagement, retired with his forces to a neighbouring eminence. Tullus perceived his treachery; but dissembling his uneasiness, told his men that Fufetius had possessed himself of that hill by his order, and that he was from thence to rush down upon the enemy. The Veientes, in the mean time, who had expected that Fufetius was to join them, were dismayed, and the Romans obtained the victory. After the battle, Tullus returned privately to Rome in the night; and having consulted with the senate about the treachery of Fufetius, returned to the camp by break of day. He then detached Horatius, who had conquered the three Curiatii, with a chosen body of horse and foot, to demolish Alba, as had been concerted at Rome. In the mean time, he commanded both the Roman and Alban troops to attend him unarmed, but gave private orders to the Romans to bring their swords concealed under their garments. When they were assembled, he laid open the treachery of Fufetius, and ordered him to be torn in pieces by horses. His accomplices were all put to the sword; and the inhabitants of Alba carried to Rome, where they were admitted to the privileges of citizens, and some of them even admitted to the senate.

Tullus now turned his arms against Fidenæ, which he again reduced under the Roman yoke; and took

Medulia, a strong city of the Latins; after which he waged a successful war with the Sabines, whose union with the Romans seems to have ceased with the time of Numa. This was the last of his martial exploits; after which we hear no more of him, but that he became extremely superstitious in his advanced years, giving ear to many foolish stories, as that it rained stones, that miraculous voices were heard from heaven, &c. and for this he appointed nine days expiatory sacrifices; whence it became a custom to appoint nine days to appease the wrath of the gods as often as men were alarmed with prodigies. As to the manner of his death authors are not agreed. Some tell us that he was killed by lightning, together with his wife, children, and his whole family; while others are of opinion that he was murdered with his wife and children by Ancus Martius who succeeded him. He died after a reign of 33 years, leaving the city greatly increased, but the dominions much the same as they had been in the time of Romulus.

After a short interregnum, Ancus Martius, the grandson of Numa by his daughter Pompilia, and Marcus his relation, was unanimously chosen by the people and senate. Though naturally inclined to war, he began his reign with attempting to restore the ceremonies of Numa, which had been neglected under Tullus Hostilius. He endeavoured also to draw the attention of his people to husbandry and the peaceful arts; advising them to lay aside all sorts of violence, and to return to their former employments. This gained him the affections of his subjects, but brought upon him the contempt of the neighbouring nations. The Latins, pretending that their treaty with Rome was expired, made inroads into the Roman territories. Ancus, after using the ceremonies directed by Numa, took the field with an army consisting entirely of new levied troops, and reduced the cities of Politorium, Tellenæ, and Ficana, transplanting the inhabitants to Rome. A new colony of Latins repeopled Politorium; but Ancus retook the place next year, and entirely demolished it. He then laid siege to Medulia; which, though it had been ruined by Tullus Hostilius, was now stronger than ever. It submitted after a siege of four years, when Ancus found himself obliged to undertake a second expedition against Ficana, which he had before reduced, as we have already related; and it was not without the utmost difficulty that he reduced it a second time. After this he defeated the Latins in a pitched battle; vanquished the Fidenates, Veientes, and Sabines; and having taken in the hill Janiculum to be included within the walls, and built the port of Ostia, he died in the 24th year of his reign.

Ancus Martius left two sons behind him, one an infant, and the other about 15 years of age. Both of these he put under the tuition of Tarquin, the son of a rich merchant in Corinth, who had fled from that city to secure his wealth from Cypselus tyrant of the place. He settled in Tarquinia, one of the principal cities in His sons  
Hetruria; but finding that he could not there attain to any of the principal posts in the city on account of his foreign extraction, he removed to Rome, where he had been gradually raised to the rank of patrician and senator. The death of Ancus Martius gave him an opportunity of assuming the regal dignity, and setting aside his pupils; and in the beginning of his reign he took

Rome. took care to strengthen his party in the senate by adding another hundred to that body. These were called *senatores minorum gentium*, because they were chosen out of the plebeians; however, they had the same authority in the senate as the others, and their children were called *patrians*.

36 Tarquin's success in war. Tarquin was not inferior to any of his predecessors either in his inclination or abilities to carry on a war. As soon as he ascended the throne, he recommenced hostilities with the Latins; from whom he took the cities of Apiolæ, Crustulium, Nomentum, and Collatia. The inhabitants of Apiolæ were sold for slaves; but those of Crustulium and Nomentum, who had submitted after their revolt, were treated with great clemency. The inhabitants of Collatia were disarmed, and obliged to pay a large sum of money; the sovereignty of it, in the mean time, being given to Egerius, the son of Arunx, Tarquin's brother; from whence he took the name of *Collatinus*, which he transmitted to his posterity. Corniculum, another city of Latium, was taken by storm, and reduced to ashes. This progress having greatly alarmed the Latins, several of them joined their forces in order to oppose such a formidable enemy; but being defeated in a bloody battle near Fidenæ, they were obliged to enter into an alliance with Rome; upon which the Latins having held a national conference, entered into a league with the Hetrurians, and again took the field with a very numerous army. But Tarquin, having defeated the confederate armies in two very bloody battles, obliged the Latin cities to submit to a kind of dependence on Rome; and, having entered the city in triumph, built the circus maximus with the spoils which he had taken from the enemy.

The war with the Latins was scarce ended, when another commenced with Hetruria. This was accounted the most powerful nation of Italy, and was at that time divided into 12 tribes or lucumonies. These appointed a national assembly, in which it was decreed that the whole force of Hetruria should be employed against Tarquin; and if any city presumed only to stand neuter, it should be for ever cut off from the national alliance. Thus a great army was raised, with which they ravaged the Roman territory, and took Fidenæ by the treachery of some of its inhabitants. Tarquin, not being in a condition to oppose them at first, was obliged to submit to the loss occasioned by their ravages for a whole year; after which he took the field with all the forces he could raise. The Roman army was divided into two bodies, one under the king himself, the other commanded by his nephew Collatinus. The latter, having divided his forces in order to plunder the country, was defeated; but Tarquin, in two engagements, vanquished the army which opposed him. He then marched against Fidenæ, where he gained a third battle; after which he took the city. Such of the citizens as were suspected to have been concerned in betraying it to the enemy were whipped to death; the rest were sent into banishment, and their lands divided by lot among the Roman soldiers. Tarquin now hastened to oppose the new army of the Hetrurians before their forces could be properly collected; and having come up with them at Eretum, a place about 10 miles from Rome, defeated them with great slaughter, for which victory he was decreed a

triumph by the senate; while the enemy, disheartened by so many misfortunes, were glad to sue for peace; which Tarquin readily granted, upon the sole condition of their owning his superiority over them. In compliance with this, the Hetrurians sent him all the 37 Ensigns of royalty sent him by the Hetrurians. Ensigns of royalty which were in use among them, viz. a crown of gold, a throne of ivory, a sceptre with an eagle on the top of it, a tunic embroidered with gold, and adorned with figures of palm branches, together with a purple robe enriched with flowers of several colours. Tarquin, however, would not wear these magnificent ornaments till such time as the senate and people had consented to it by an express law. He then applied the regalia to the decoration of his triumph, and never afterwards laid them aside. In this triumph he appeared in a gilt chariot, drawn by four horses, clothed in a purple robe, and a tunic embroidered with gold, a crown on his head, and a sceptre in his hand, attended by 12 lictors with their axes and fasces.

Tarquin, having now obtained some respite from war, applied himself to the beautifying and ornamenting the city. He built the walls of Rome with hewn stone, and erected those famous common sewers which have deservedly been accounted one of the wonders of the world. Rome at this time contained four hills within its compass, viz. the Palatinus, Tarpeius, Quirinalis, and Cælius. In the valleys between these hills, the rain-water and springs uniting, formed great pools which laid under water the streets and public places. 38 Builds the common sewers, and ornaments the city. The mud likewise made the way impassable, infected the air, and rendered the city unhealthy. Tarquin undertook to free the city from this nuisance, by conveying off these waters by subterraneous channels into the Tiber. In doing this, it was necessary to cut hills and rocks a channel large enough for a considerable stream, and covered with arches strong enough to bear the weight of houses, which were frequently built upon them, and stood as firm as on the most solid foundations. All these arches were made of hard stone, and neither trouble nor expence were spared to make the work durable. Their height and breadth were so considerable, that a cart loaded with hay could easily pass through them under ground. The expence of constructing these sewers was never so thoroughly understood as when it became necessary to repair them; for then the censors gave no less than 1000 talents to the person appointed for this purpose.

Besides these great works, Tarquin adorned the forum, surrounding it with galleries in which were shops for tradesmen, and building temples in it for the youth of both sexes, and halls for the administration of public justice. He next engaged in a war with the Sabines, on pretence that they had assisted the Hetrurians. Both armies took the field, and came to an engagement on the confines of Sabinia, without any considerable advantage on either side; neither was any thing of consequence done during the whole campaign. Tarquin then, considering with himself that the Roman forces were very deficient in cavalry, resolved to add some new bodies of knights to those already instituted by Romulus. But this project met with great opposition from the superstitious augurs, as the original division of horse into three bodies had been determined by auguries; and Aclius Nævius, the chief of the

the diviners at that time, violently opposed the king's will. On this Tarquin, desirous to expose the deceit of these people, summoned Nævius before an assembly of the people, and desired him to show a specimen of his art, by telling the king if what he thought of at that time could be done or not. The augur replied, after consulting his birds, that the thing was very possible. On which Tarquin told him, that he had been thinking whether it was possible to cut a flint with a razor, pulling at the same time a razor and flint from below his robe. This set the people a-laughing; but Nævius gravely desiring the king to try it, he was surprised to find that the flint yielded to the razor; and that with so much ease as to draw blood from his hand. The people testified their surprise by loud acclamations, and Tarquin himself continued to have a great veneration for augurs ever after. A statue of him was erected to the memory of Nævius, which continued till the time of Augustus; the razor and flint were buried near it, under an altar, at which witnesses were afterwards sworn in civil causes.

Rome. dy these evils, and put it in execution, by enacting a law, enjoining all the Roman citizens to bring in an account in writing of their own names and ages, and of those of their fathers, wives, and children. By the same law, all heads of families were commanded to deliver in upon oath a just estimate of their effects, and to add to it the places of their abode, whether in town or country. Whoever did not bring in an account of his effects, was to be deprived of his estate, to be beat with rods, and publicly sold for a slave. Servius, from these particular accounts, which might be pretty well relied on, undertook to ease the poor by burdening the rich, and at the same time to please the latter by increasing their power.

44  
His division  
of the peo-  
ple into  
classes.

To this end, he divided the Roman people into six classes: the first class consisted of those whose estates and effects amounted to the value of 10,000 drachmæ, or 100,000 ascs of brass; the first way of computing being used by the Greeks, and the latter by the Latins. This class was subdivided into 80 centuries, or companies of foot. To these Servius joined 18 centuries of Roman knights, who fought on horseback; and appointed this considerable body of horsemen to be at the head of the first class, because the estates of these knights, without all doubt, exceeded the sum necessary to be admitted into it. However, the public supplied them with horses; for which a tax was laid upon widows, who were exempt from all other tributes. This first class, including infantry and cavalry, consisted of 98 centuries. The second class comprehended those whose estates were valued at 5700 drachmæ, or 57,000 ascs of brass. It was subdivided into 20 centuries, all foot. To these were added two centuries of carpenters, smiths, and other artificers. In the third class were those who were esteemed worth 5000 drachmæ, or 50,000 ascs. This class was subdivided into 20 centuries. The fourth class was of those whose effects were rated at the value of 2500 drachmæ, or 25,000 ascs, and was divided into 20 centuries; to which were added two other centuries of trumpets, and blowers of the horn, who supplied the whole army with this martial music. The fifth class included those only whose whole substance did not amount to more than 1350 drachmæ, or 13,500 ascs; and this class was divided into 30 centuries. The sixth class comprehended all those who were not worth so much as those of the fifth class: they exceeded in number any other class, but nevertheless were reckoned but as one century.

The king drew from these regulations all the advantages he had expected. Levies for the army were no longer raised by tribes, nor were taxes laid at so much a head as formerly, but all was levied by centuries. When, for instance, an army of 20,000 men, or a large supply of money, was wanted for the war, each century furnished its quota both of men and money; so that the first class, which contained more centuries, though fewer men, than all the others together, furnished more men and more money for the public service than the whole Roman state besides. And by this means the Roman armies consisted for the most part of the rich citizens of Rome; who, as they had lands and effects to defend, fought with more resolution, while their riches enabled them to bear the expence of a campaign. As it was but just the king should make the first class amends for the weight laid on it,

he gave it almost the whole authority in public affairs; changing the comitia by curiæ, in which every man gave his vote, into comitia by centuries, in which the majority was not reckoned by single persons, but by centuries, how few soever there might be in a century. Hence the first class, which contained more centuries than the other five taken together, had every thing at its disposal. The votes of this class were first taken; and if the 98 centuries happened to agree, or only 97 of them, the affair was determined; because these made the majority of the 193 centuries which composed the six classes. If they disagreed, then the second, the third, and the other classes in their order, were called to vote, though there was very seldom any occasion to go so low as the fourth class for a majority of votes: so that by this good order Servius brought the affairs of the state to be determined by the judgment of the most considerable citizens, who understood the public more well than the blind multitude, liable to be imposed upon, and easily corrupted.

45  
And now the people being thus divided into several orders, according to the census or valuation of their estates, Servius resolved to solemnize this prudent regulation by some public act of religion, that it might be the more respected and the more lasting. Accordingly, all the citizens were commanded to appear, on a day appointed, in the Campus Martius, which was a large plain, lying between the city and the Tiber, formerly consecrated by Romulus to the god Mars. Here the centuries being drawn up in battalions, a solemn lustration or expiatory sacrifice was performed in the name of all the people. The sacrifice consisted of a sheep, a sheep, and a bull, whence it took the name of *lustrum*. The whole ceremony was performed in the hands; that is, from paying, expiating, lustrum; perhaps from the goddess Lupa, who suckled the twins, and to whom Servius had dedicated a temple. This wise king considering, that in the space of 100 years there might be such alterations in the persons of private persons as to entitle some to be raised to a higher class, and reduce others to a lower, concluded that the census should be renewed every five years. At the census was usually closed by the *lustrum*, the Romans henceforth began to compute time by *lustrum*, each *lustrum* containing the space of five years. However, the *lustrum* were not always regularly observed, but often put off, though the census had been made in the fifth year. Some writers are of opinion, that Servius at this time coined the first money that had ever appeared at Rome; and add, that the circumstances of the *lustrum* probably led him to stamp the figures of the animals there slain on pieces of brass of a certain weight.

46  
The government of the city being thus established in so regular a manner, Servius, touched with compassion for those whom the misfortunes of an unsuccessful war had reduced to slavery, thought that such of them as had by long and faithful services deserved and obtained their freedom, were much more worthy of being made Roman citizens, than untractable vagabonds from foreign countries, who were admitted without distinction. He therefore gave the freedmen their choice, either to return to their own country, or continue at Rome. Those who chose to continue there, he divided into four tribes, and settled them within the city; and

Rome.

and though they were distinguished from the plebeians by their old name of *liberti*, or *freedmen*, yet they enjoyed all the privileges of free citizens. The senate took offence at the regard which the king showed to such mean people, who had but lately shaken off their fetters; but Servius, by a most humane and judicious discourse, entirely appeased the fathers, who passed his institution into a law, which subsisted ever after.

47  
Reforms  
the royal  
power.

The wise king, having thus established order among the people, undertook at last to reform the royal power itself; his equity, which was the main spring of all his resolutions, leading him to act contrary to his own interest, and to sacrifice one half of the royal authority to the public good. His predecessors had reserved to themselves the cognizance of all causes both public and private; but Servius, finding the duties of his office too much for one man to discharge well, committed the cognizance of ordinary suits to the senate, and reserved that only of state crimes to himself.

48  
Endeavours  
to attach  
the Sabines  
and Latins  
to the Ro-  
mans.

All things being now regulated at home, both in the city and country, Servius turned his thoughts abroad, and formed a scheme for attaching the Sabines and Latins to the Romans, by such social ties as should be strengthened by religion. He summoned the Latin and Sabine cities to send their deputies to Rome, to consult about an affair of great importance. When they were come, he proposed to them the building of a temple in honour of Diana, where the Latins and Sabines should meet once a-year, and join with the Romans in offering sacrifices to that goddess; that this festival should be followed by a council, in which all the cities should be amicably determined on their proper measures, should be taken to settle their mutual interest; and lastly, in order to prevent all future disputes, a law should be kept, that no man should quarrel with another, who was present at the festival, or who met with no opposition; he only added to it, that the temple should be a compleat asylum for the united nations; and that all the cities should contribute toward the expense of building it. It being left to the king to choose a proper place for it, he pitched upon the Aventine hill, where the temple was built, and assemblies annually held in it. The laws which were to be observed in these general meetings were engraved on a pillar of brass, and were to be seen in Augustus's time, in the Latin tongue, but in Greek characters.

49  
Wicked in-  
trigues of  
his daugh-  
ter and son-  
in-law.

But now Servius was grown old; and the ambition of Tarquin his son-in-law revived in proportion as the king advanced in years. His wife used her utmost endeavours to check the rashness and fury of her husband, and to divert him from all criminal enterprises; while her younger sister was ever instigating Aruns; who placed all his happiness in a private life, to the most villainous attempts. She was continually lamenting her fate, in being tied to such an indolent husband, and wishing she had either continued unmarried, or were become a widow. Similitude of temper and manners, formed, by degrees, a great intimacy between her and Tarquin. At length she proposed nothing less to him than the murdering of her father, sister, and husband, that they two might meet and ascend the throne together. Soon after, they paved their way to an incestuous marriage, he by poisoning his wife, and she her husband; and then had the assurance to ask the king's

and queen's consent to their marriage. Servius and Tarquinius, though they did not give it, were silent, through too much indulgence to a daughter in whom now was their only hope of posterity. But these criminal nuptials were only the first step towards a yet greater iniquity. The wicked ambition of the new-married couple first showed itself against the king: for they publicly declared, that the crown belonged to them; that Servius was an usurper, who, being appointed tutor to Tarquin's grandchildren, had deprived his pupils of their inheritance; that it was high time for an old man, who was but little able to support the weight of public affairs, to give place to a prince who was of a mature age, &c.

The patricians, whom Servius had taken great pleasure in humbling during the whole time of his reign, were easily gained over to Tarquin's party: and, by the help of money, many of the poorer citizens were also brought over to his interest. The king, being informed of their treasonable practices, endeavoured to dissuade his daughter and son-in-law from such proceedings, which might end in their ruin; and exhorted them to wait for the kingdom till his death. But they, despising his counsels and paternal admonitions, resolved to lay their claim before the senate; which Servius was obliged to summon; so that the affair came to a formal process. Tarquin reproached his father-in-law with having ascended the throne without a previous interregnum; and with having bought the votes of the people, and despised the suffrages of the senate. He then urged his own right of inheritance to the crown, and injustice of Servius, who, being his only guardian, had kept possession of it, when he himself was of an age to govern. Servius answered, that he had been lawfully elected by the people; and that, if there could be an hereditary right to the kingdom, the sons of Ancus had a much better one than the grandsons of the late king, who must himself have been an usurper. He then referred the whole to an assembly of the people; which being immediately proclaimed all over the city, the forum was soon filled; and Servius harangued the multitude in such a manner as gained all their affections. They all cried out with one voice, *Let Servius reign; let him continue to make the Romans happy.* Amidst their confused clamours, these words were likewise heard: *Let Tarquin perish; let him die; let us kill him.* This language frightened him so, that he retired to his house in great haste; while the king was conducted back to his palace with the acclamations of the people.

The ill success of this attempt cooled Tarquin's ardent desire of reigning; but his ambition made him act a new part. He undertook to regain the favour of his father-in-law by caresses, submissions, and protestations of a sincere regard and affection for him; inasmuch that the king, who judged of the policy of others from his own, was sincerely reconciled to him, and tranquillity re-established in the royal family. But it was not long ere Tarquin, roused by the continual reproaches of his wife, began to renew his intrigues among the senators; of whom he had no sooner gained a considerable party, than he clothed himself in the royal robes, and causing the fasces to be carried before him by some of his domestics, crossed the Roman forum, entered the temple where the senate used to meet, and seated him-

Rome.

self on the throne. Such of the senators as were in the faction he found already in their places (for he had given them private notice to be there early); and the rest, being summoned to assemble in Tarquin's name, made what haste they could to the appointed place, thinking that Servius was dead, since Tarquin assumed the title and functions of king. When they were all assembled, Tarquin made a long speech, reviling his father-in-law, and repeating the invectives against him, which he had so often uttered, calling him a slave, an usurper, a favourer of the populace, and an enemy to the senate and patricians. When he was yet speaking, Servius arrived; and, rashly giving way to the motions of his courage, without considering his strength, drew near the throne, to pull Tarquin down from it. This raised a great noise in the assembly, which drew the people into the temple; but nobody ventured to part the two rivals. Tarquin therefore, being more strong and vigorous, seized the old man by the waist, and, hurrying him through the temple, threw him down from the top of the steps into the forum. The king, who was grievously wounded, raised himself up with some difficulty: but all his friends had abandoned him; only two or three of the people, touched with compassion, lent him their arms to conduct him to his palace.

As they were leading him on so slowly, the cruel Tullia appeared in the forum, whither she had hastened in her chariot on the first report of what had passed in the senate. She found her husband on the top of the steps of the temple; and, transported with joy, was the first who saluted him king. The example was immediately followed by the senators of Tarquin's party. Nor was this enough for the unnatural daughter: she took aside her husband, and suggested to him, that he would never be safe so long as the usurper of his crown was alive. Hereupon Tarquin instantly despatched some of his domestics to take away the remains of the unfortunate king's life. The orders for the wicked parricide were no sooner given than Tullia mounted her chariot again, with an air of triumph, to return home. The way to her house was through a narrow street, called *vicus cyprinus*, or the *good street*. There the assassins had left the king's body, which was still panting. At this sight, the charioteer, struck with horror, checked his horses, and made a stop: but Tullia forced him to go on; and the blood of the father is said to have dyed the wheels of the chariot, and even the clothes of the inhuman daughter, whence the street was called ever after *vicus fideles*.

50  
Servius  
Tullius  
murdered.

51  
Tarquin II.  
in cruelty-  
tant.

The new king proved a most despotic and cruel tyrant; receiving, in the very beginning of his reign, the surname of *proud*, on account of his capricious humour and haughty behaviour. All controversies whatever were decided by himself and his friends; and he banished, fined, and even executed, whom he pleased. The census and lustrum, the division of citizens into classes and centuries, were abolished; and all kinds of assemblies, even those for amusement and recreation, were prohibited, both in town and country. Nay, to such a height did Tarquin carry his insolence and tyranny, that the most virtuous of the senators went into voluntary banishment; while many of those who remained were cut off on various pretences, that the king might enjoy their estates.

Tarquin could not but be sensible of the extreme dan-

ger in which he stood by losing the affections of his people in such a manner. He therefore provided a sufficient number of soldiers, by way of guard, to prevent attempts upon his person; and gave his daughter to Octavius Mamilius, one of the most considerable men among the Latins, in order to strengthen his interest by this foreign alliance, in case of a revolt among his subjects. Mamilius accordingly procured many friends to his father-in-law, but he had like to have lost them again by his haughty behaviour. He had desired the Latins to call a national council at Ferentinum, where he would meet them on a day appointed by himself. The Latins accordingly met; but after waiting for several hours, Tarquin did not appear. On this, one Turnus Herdonius, an enterprising and eloquent man, who hated Tarquin, and was jealous of Mamilius, made a speech, in which he inveighed against the haughty behaviour of Tarquin, set forth the contempt which he had put upon the Latins, and concluded with desiring the council to break up and return home without taking any further notice of him. Mamilius, however, prevailed upon them to return the day following; when Tarquin made his appearance, and told the assembly that his design in calling them together was to claim his right of commanding the Latin armies, which he said was derived from his grandfather, but which he desired to be confirmed to him by them. These words were scarce out of his mouth, when Herdonius, rising up, entered into a detail of Tarquin's tyranny and arbitrary behaviour at Rome, which, he said, the Latins would soon feel in an equal degree, if they complied with Tarquin's demand. To this speech the king made no reply at that time, but promised to answer them next day. In the mean time, however, he ordered the domestics of Herdonius to admit among his baggage a large quantity of arms; and then, telling the council that Herdonius's opposition proceeded only from Tarquin's having refused him his daughter in marriage, accused him of having laid a plot to cut off all the deputies there present, and to usurp a jurisdiction over the Latin cities; as a proof of which he appealed to the arms hid among the baggage of Herdonius. The accused, conscious of his innocence, desired that his baggage might be searched; which being accordingly done, and the arms found, he was hurried away without being allowed to make any defence, and thrown into a basin at the head of the spring of Ferentinum, where a hurdle being laid upon him, and stones laid upon the hurdle, he was pressed down into the water and drowned.

In consequence of this monstrous treachery, Tarquin was looked upon by the Latins as their deliverer, and declared general of the Latin armies; soon after which, the Hernici and two tribes of the Volsci entered into an alliance with him on the same terms. In order to keep these confederates together, Tarquin, with their consent, erected a temple to Jupiter Latialis on a hill near the ruins of Alba, where he appointed certain feasts called *Feria Latina* to be held on the 27th of April, where the several nations were to sacrifice together, and on no account to commit any hostilities against each other during their continuance. The king then proceeded to make war on the rest of the Volsci who had refused to enter into an alliance with him. Some depredations which they had committed in the territo-

Rome.

ries of the Latins served for a pretence to begin the war; but as Tarquin had no confidence in the Romans, his army was composed only of a small body of them who were incorporated among the Latin auxiliaries. However, he defeated the enemy, took one of their cities by storm, and gave the booty to his soldiers. He next turned his arms against the Sabines, whom he entirely defeated in two engagements, and made the whole nation tributary; for which exploits he decreed himself two triumphs, and on his return to Rome he employed the populace in finishing the sewers and circus which had been begun by his grandfather Tarquin I.

54  
Reduces  
Gaius by  
treachery

In the mean time, the persecutions of Tarquin against his own subjects daily drove some of the most considerable into banishment. A great number of patricians took refuge in Gabii, a city of Latium about 13 miles from Rome; where the inhabitants, touched with compassion for their misfortunes, not only received them with kindness, but began a war with Tarquin on their account. The Gabini seem to have been the most formidable enemies whom the Romans had hitherto met with; since Tarquin was obliged to raise a prodigious bulwark to cover the city on the side of Gabii. The war lasted seven years; during which time, by the mutual devastations committed by the two armies, a great scarcity of provisions took place in Rome. The people soon grew clamorous; and Tarquin being unable either to quiet them, or to reduce the Gabini, fell upon the following dishonourable and treacherous expedient: His son Sextus Tarquinius pretended to be on very bad terms with his father, and openly inveighed against him as a tyrant; on which he was proclaimed a rebel, and publicly beaten in the forum. This being reported at Gabii, by persons sent thither on purpose, the inhabitants became very desirous of having Sextus among them; and accordingly he soon went thither, having previously obtained a solemn promise from the inhabitants never to deliver him up to his father. Here he made frequent inroads into the Roman territories, and always came back laden with spoil, his father sending against him only such weak parties as must infallibly be worsted. By this means he soon came to have such a high degree of credit among the Gabini, that he was chosen general of their army, and was as much master at Gabii as Tarquin was at Rome. Finding then that his authority was sufficiently established, he despatched a slave to his father for instructions; but the king, unwilling to return an explicit answer, only took the messenger into the garden, where he struck off the heads of the tallest poppies. Sextus understood that by this hint the king desired him to put to death the leading men in the city of Gabii, which he immediately put in execution; and while the city was in confusion on account of this massacre, he opened the gates to his father, who took possession of the city with all the pride of a conqueror.—The inhabitants dreaded every thing from the haughty tyranny of the Roman monarch; however, on this occasion he consulted his policy rather than his revenge; granted them their life, liberty, and estates, and even entered into a treaty of alliance with them. The articles were written on the hide of an ox, which was still to be seen in the time of Augustus, in the temple of Jupiter Fidius. After this, however, he made his son Sextus king of Gabii; sending off also

his two other sons, Titus and Arunx, the one to build a city at Signia, the other at Circæum, a promontory of the Tyrrhene sea, and both these to keep the Volsci in awe.
